27th International Congress of Applied Psychology
11-16 July 2010 Melbourne Australia

Abstracts of the 27th International Congress of Applied Psychology

Editors: Vicky Mrowinski, Michael Kyrios and Nicholas Voudouris

www.icap2010.com
Forward from the Editors

It is with great pleasure that we present the Abstracts of the 27th International Congress of Applied Psychology. These abstracts represent the great breadth of topics covered by the presentations at the Congress, including over 100 State of the Art and other invited keynote addresses, over 200 symposia, almost 600 individual oral presentations, over 600 brief oral presentations, and over 550 electronic posters, bringing together more than 2000 presenters from 60 countries - a truly international event. The range and depth of the research reflected in these abstracts attests to the vibrant international applied psychology community across the world.

The 27th International Congress of Applied Psychology incorporated the 45th Annual Australian Psychological Society Conference, and on behalf of the Scientific Program Committee, we’d like to thank all who contributed to the scientific program on behalf of the IAAP and the APS. We would also like to thank the many Congress registrants for helping to make this such a successful event, both for the IAAP and the APS.

All abstracts presented here have been blind reviewed by a dedicated group of volunteer reviewers, who deserve our sincerest thanks for participating in the review process, many of them dedicating a considerable amount of their time to ensuring the high quality of presentations during the Congress.

This publication would not have been possible without the dedication and hard work of those at the Australian Psychological Society, who worked tirelessly to proof read, collate and format these abstracts. We are extremely grateful and thankful to Joanne Howard, Athena Politis, Renee Taylor, Jennifer Jackson, Kylie Murphy, Angela Nicholas, and many, many others for their support. Special thanks must also be paid to Laura Sciacchitano for her tireless effort and enthusiasm in completing this publication.

Opening Keynote Address

The more who die, the less we care: Psychic numbing and genocide

SLOVIC, P. (Decision Research and University of Oregon)

Most people are caring and will exert great effort to rescue individual victims whose needy plight comes to their attention. These same good people, however, often become numbly indifferent to the plight of individuals who are “one of many” in a much greater problem. Why does this occur? The answer to this question will help us answer a related question that is the topic of this talk: Why, over the past century, have good people repeatedly ignored mass murder and genocide? I shall draw from psychological research to show how the statistics of mass murder or genocide, no matter how large the numbers, fail to convey the true meaning of such atrocities. The reported numbers of deaths represent dry statistics, “human beings with the tears dried off,” that fail to spark emotion or feeling and thus fail to motivate action. Recognizing that we cannot rely only upon our moral feelings to motivate proper action against genocide, we must look to moral argument and international law. The 1948 Genocide Convention was supposed to meet this need, but it has not been effective. It is time to examine this failure in light of the psychological deficiencies I shall describe and design legal and institutional mechanisms that will enforce proper response to genocide and other forms of mass murder.
State of the Art Addresses
Promoting health behaviour change

ABRAHAM, C. (University of Sussex)

Behaviour patterns have a critical impact on health and are modifiable. This talk will focus on how we can modify preventive health behaviours. Health-related behaviour patterns are embedded in national and international legislative and social contexts. Consequently, promoting health behaviour change may sometimes be best addressed through policy and legislative reform. Other behaviour patterns may be most effectively resolved through community development or organisational change (including worksite interventions). Whether interventions are designed to change social structure or individual regulation, they must be based on empirically supported models of health-related behaviour. The utility of the “Information, Motivation, Behavioural Skills” model and the “Reflective Impulsive Model” will be discussed. Evidence suggests that effective health promotion depends on the quality of intervention planning and the six-stage “Intervention Mapping” approach to intervention design will be introduced. In addition, guidance produced the UK Health and Clinical Excellence on health promotion targets and practitioner competencies will also be reviewed briefly. Designing health promotion interventions depends on implementation of single or multiple behaviour change techniques. Such techniques must directly impact on the processes which maintain and change targeted behaviour patterns. This necessitates an empirically-based, consensual understanding of the causal processes which shape health behaviour. In addition, intervention designers need to be able to choose from a range of tested and defined techniques that have the capacity to alter underlying regulatory processes. A recently-extended taxonomy of behaviour change techniques will be presented and discussed. The effectiveness of behaviour change interventions can only be established through empirical evaluation. Unfortunately, even costly health promotion interventions are not always evaluated and so contribute nothing to our understanding of “what works”. When interventions are undertaken both internal and external validity and mediating processes should be considered. External validity needs to be ensured in planning and evaluation and the RE-AIM model will be discussed to emphasise this point.

Behavioral economics applied: Suggestions for policy making

ANTONIDES, G. (Wageningen University)

Behavioral economics combines economics with other social science disciplines, notably psychology, and aims at better explanations of economic behavior by taking into account bounded rationality in decision processes, bounded will-power, bounded selfishness and esteem needs of decision makers. Behavioral economics has first studied heuristics and biases in the laboratory, then has been applied to the field and to general economic theory, and finally has become relevant to policy making of the government, consumer interest groups and companies. Several theories capturing bounded rationality employ the distinction between analytic and intuitive types of decision making, including the elaboration likelihood model, dual processing models, system I versus system II models, and neuroeconomic models. In general, the use of intuitive types of decision making leads to suboptimal or undesirable decision outcomes, hence several ideas have been developed to help people to achieve optimal and desirable outcomes. Such ideas include teaching, learning, communication, and changing the context of the choice situation. In addition, rules and laws may be applied with the goal of de-motivating undesirable behavior. A number of policy instruments may be used to guide people’s behavior in order to obtain optimal and desirable outcomes. Typically, behavioral economic policy instruments favor liberal paternalistic policy applications, i.e., applications aimed at influencing decision making of people with limited rationality and bounded will-power, without constraining rational decision makers with strong will-power. Such policies include providing information, changing the status quo, framing the decision context, and using contrast, compromise, format, probability, and motivational effects. For each of these policy alternatives a number of examples are given. Whereas neo-classical economics has mainly led to paternalistic policy instruments, e.g., pricing and taxation, behavioral economics offers many
alternatives that 'nudge' people's behavior into the desired direction without enforcement.

Vocational psychology: Current status and future directions

BLUSTEIN, D. (Boston College)

This state of the art presentation will provide a critical analysis of vocational psychology, which has historically focused on work-related concerns, dilemmas, and adjustment challenges at an individual level. Vocational psychology provides the theoretical and empirical support for career counseling, career development education, and public policy initiatives pertaining to education, career development, and labor policy. Beginning with a review of the major theoretical and practice paradigms, the presentation will review illustrative research trajectories in vocational psychology. The presentation will conclude with a review of challenges and opportunities for vocational psychology, highlighting the impact of recent movements to expand the purview of the field to include all individuals who work and who seek work.

Global special issue on psychology and poverty reduction

CARR, S. (Massey University), BANDAWE, C. (University of Malawi)

Psychology currently has little or no profile within poverty reduction initiatives. Demand has not framed our supply. Demand is interdisciplinary, necessitating collaboration with other disciplines, professions, local communities and traditional wisdom. Politically, applied psychology can align with the Millennium Development Goals, focussing on harmonisation of human services and crucially, alignment with local aspirations, while emphasising its own uniqueness and unique contributions. These include theoretical depth, rigour in measurement, and experimental evaluation, both laboratory and field. Capitalising on those strengths, we can develop an applied psychology of Poverty Reduction Strategy Papers (in-country planning for development), human capacity development (including the psychology of global mobility), budget support to governments vs. project aid to local communities, corporate social responsibility, media psychology in poverty appeals, and the psychology of household health. Promising starts have been made, and these are briefly reviewed in the keynote. Applying psychology to poverty is not just an exercise for science and practice. We can also articulate our professional and ethical values, build capacity within the profession, boost awareness of what we do with policymakers and global think-tanks, and become more humanitarian in application. We should retain empiricism but focus more on problems of immediate need in the local population. There are at least three initiatives that applied psychologists can join right now. A first is the emergent network Humanitarian Work Psychology (http://www.humworkpsy.org). This network has been set up to foster decent work and organisational effectiveness in reducing poverty. Membership is open to anyone with an interest in these goals, and uses 21st-century technology to enable connectivity with applied psychologists in lower, middle and higher income economies. A second initiative will be launched at the ICAP conference, a Global Special Issue focused exclusively on “Psychology and Poverty Reduction” (http://poverty.massey.ac.nz). Twelve psychology journals have collaborated together in this project, and conference delegates are warmly invited to attend the Panel Discussion about its present and future goals. Finally and most importantly, applied psychologists can become more involved in empirical evaluations of the kinds of practices that make a difference in poverty reduction, and why. A range of such projects will be discussed.

Geropsychology

FERNANDEZ BALLESTEROS, R. (Autonomous University of Madrid)

With increasing life expectancy and at the same time, decreasing fertility, the world is experiencing “population aging”, that is an increase in the proportion of older people in comparison with younger people. Moreover, over the next 50 years, population aging is expected to continue. The increase in life expectancy and in the proportion of older adults
in the total population is paralleled by an increase in research in basic and applied geropsychology. The applied psychology of the aged can be defined as the study of the problematic and non-problematic elderly from a psychological perspective. It is important to emphasize that applied geropsychology cannot be reduced to just the problematic or pathological aged. Biomedical studies of aging generate a negative view of old age because from a biological point of view aging is a continuous process of loss of functionality (reinforcing the existing stereotypes the aged). However, from a psychological point of view, psychosocial functioning cannot be understood with the same principles that govern biological processes. Although there is an increasing risk of decline and a decreasing potential for growth across the adult life span, the nature of adult development has to be understood as multidimensional in which gains and losses can coexist. Psychological development is a lifelong process. There is large interindividual variability in age-associated changes, and variability increases at least up to the 7th decade of life. In recognition of heterogeneity of aging, authors agree on three different forms of aging: usual or normal, pathological, and optimal or successful. Normal aging refers to growing old, even when some manifest illness occur; the individual continues being independent. Optimal aging is the aging that would be possible under optimal personal and environmental conditions with high physical, psychological, and social functioning. Finally, pathological aging refers to changes due to physical and/or mental illness inducing disability and dependency in the older individual. In addition to the interindividual variability, there is also a broad possibility of change or plasticity. Thus, individuals have a dynamic capacity for change across the life-span, and effective interventions are needed to promote positive change, maintain functioning, reverse negative changes (if possible), or at least delay age-associated negative changes to foster maintaining well-being across old age. In summary, psychologists can contribute not only to clinical gerontology but, also, to the extension of healthy life through promotion of active aging, health maintenance, and prevention of disability through the development of healthy habits and life styles. These topics are important recommendations in the II International Plan of Action on Aging (UN, 2002) and the World Health Organization (WHO, 2002) and could be considered as the core of Geropsychology.

**Success stories, squabbles, surprises, and suggestions for research in industrial psychology**

FISHER, C. (Bond University)

This talk starts with a brief overview of the identity and future of the field of industrial psychology, together with discussion of the persistent “research-practice gap.” While industrial psychology includes at a minimum research on recruitment, selection, training, and performance appraisal, I will spend the bulk of the talk discussing research and issues in employee selection. The talk highlights first the major success stories for industrial psychology - areas in which we have made major discoveries and impacted the practice of employee selection. Next, I will identify squabbles - areas characterised by vigorous debate and disagreement in the selection literature. I will then discuss a few surprises - interesting or novel findings that I encountered while preparing the handbook chapter. Finally, I will suggest some areas for future research on employee selection.

**Psychopathological consequences of terrorist attacks and their treatment**

GARCIA VERA, M.P. (University of Madrid)

The spread of terrorism to developed countries has made it a world wide focus of concern and a new focus of research. This research has explored the psychopathological consequences of the attacks and the best ways to treat them. Although Posttraumatic Stress Disorder (PTSD) is the most common disorder resulting from a terrorist attack, research has shown that other disorders occur like depressive disorders, agoraphobia, panic disorder and generalized anxiety disorder. These disorders may appear with or without PTSD. The probability of suffering these disorders and their persistence depends on a set of variables that include characteristics and severity of the attack, and the amount of exposure victims have to the
attack and its consequences. We have a wide variety of possible treatments at our disposal. Research to date supports the use of cognitive-behavioural therapy as the treatment of choice. In addition, further research may support the efficacy and utility of other treatments.

The evolution of ethics in psychology: Going international and global

GAUTHIER, J. (Laval University)

Many ethics codes for psychologists have been developed by national psychology organizations. However, psychologists live in a globalizing world where traditional boundaries are fading and, therefore, they increasingly work with persons from diverse cultural backgrounds within their own country or in other countries. Ethics is at the core of psychology as a scientific discipline and a profession providing services to the public. It takes a conscious effort to understand the implications for psychology of the cultural differences that exist, especially since most of us have not been nurtured or socialized in the multicultural aspects of today's changing world. In this address, I will review formally adopted regional and international ethics documents intended to be applied across national boundaries and discuss their meaning in terms of the evolution of ethics in psychology. In addition, I will review the research literature on ethics from an international perspective and highlight important questions to consider for the advancement of international ethics. I will suggest that hopes for psychology's contribution to building a better world require the promotion of aspirational principles and that there is promise of worldwide benefit for psychologists and those whom they serve in expanding our international horizons and global perspective.

The dragons of inaction: Why we do less than we should

GIFFORD, R. (University of Victoria)

Most people think that environmental problems are important, but too few are engaged in enough pro-environmental behavior to prevent increasing problems of many kinds. Why is that? Structural barriers such as poverty and climate-averse infrastructure are part of the answer, but psychological barriers also impede behavioral choices that would facilitate pro-environmental behavior choices. Although many individuals are engaged in some ameliorative action, most could do more because they are hindered by six types of barriers: limited cognition, ideology, social comparison, investments, mistrust, and limited behavior. Structural barriers must be removed wherever possible, but this is unlikely to be sufficient. Psychologists must work with other scientists, technical experts, and policy-makers to help citizens overcome these psychological barriers.

Traffic Psychology: A State of the Art Review

GLENDON, I. (Griffith University)

An analysis of nearly 1500 empirical traffic psychology papers published during the years 1998–2008 revealed authors from 52 countries. However, authorship was concentrated in developed nations, with three countries contributing 54% of publications during the sampled period. Over 100 nations, containing almost one third of the world's population, had no representation at all. Only a handful of papers used traffic psychology models as a conceptual basis. Around 15 percent adopted some recognisable theoretical framework as a conceptual basis for study – the remaining 85 percent were driven by data exploration, correlational designs or statistical modelling. The theory of planned behaviour (TPB) – including its predecessor (theory of reasoned action – TRA) and TPB variants was the most frequently adopted conceptual framework. While most conceptual frameworks appeared in only a single publication, the TPB was identified as the conceptual basis in 33 studies and the TRA in a further five studies. Single-measure cross-sectional designs were the most commonly adopted design for the widely-used questionnaire/survey data collection method. Only 28 studies adopted an intervention or evaluation design. To collect data on a vast range of variables, 542 tests, questionnaires and other measures were used in these studies. Of these 152 were driving-specific measures – the remainder being generic measures. A rich variety of participant origins, data collection methods
and instruments employed was matched by considerable diversity in data analysis techniques, with over 440 techniques being identified. Conclusions focused on the need for greater internationalisation of traffic psychology, a more prominent role for theory and conceptual models in traffic psychology research, bridging the researcher-practitioner divide, methodology, extending the range and nature of variables studied and analysed, training, and extending traffic psychology to link more closely with other transportation domains.

Technical advances and guidelines for improving testing practices

HAMBLETON, R. (University of Massachusetts), BARTRUM, D. (SLH Group Limited), OAKLAND, T. (University of Florida)

The number of educational and psychological tests administered each year around the world continues to grow. Educational reform in many countries has resulted in a major expansion of state and national testing programs, including participation in international assessments such as TIMSS and PISA. We do not know just how well these new tests are being constructed and used to make effective decisions about individuals and programs. What is clear is that the testing methodology to support these individual and programmatic decisions is very much on the increase and more statistically sophisticated than in the past: We have seen the transition from classical to modern measurement models and methods, we have seen the increased use of generalizability theory and structural equation modelling, and we have seen the transition from paper and pencil testing to computer-based testing. In this presentation, we will provide a brief review of types of tests and test uses around the world, emphasize several psychometric topics that are having consequences for developers and users of tests—e.g., item response theory, computer based testing, new item types, detection of potentially biased test items, and test adaptation methodology, and we will review the guidelines prepared by the International Test Commission and EFPA for improving testing practices around the world.

Media and Consumer Psychology

KARDES, F. (University of Cincinnati), GODDARD, P. (Northern Kentucky University), HAN, X. (University of Cincinnati), PFEIFFER, B. E. (University of New Hampshire)

Consumer judgment and decision making is influenced by a large and complex set of variables that capture the attention and interest of consumers; influence how consumers acquire, retain, and revise product knowledge; and influence how product knowledge is used. Consistent with the implications of the selective hypothesis testing model, selective attention, selective encoding, and selective retrieval processes determine what information is likely to be used and how it is used. The mass media prime a wide variety of concepts that influence the interpretation, evaluation, and choice of products and services. New data on the subliminal prime-to-behavior pathway will be presented. Dual-process models emphasize that effortful information processing occurs only when consumers are sufficiently motivated and able to do so; otherwise, a wide variety of simplifying processes are likely to be used. Rather than using all relevant information and knowledge, consumers typically rely on the subset of information and knowledge that is most readily accessible from memory, provided that this subset is perceived as relevant or diagnostic. Missing information is often neglected, even when this information is diagnostic, and this can lead to strong judgments based on weak evidence. Implications of selective processing and persuasion models for understanding marketing alcohol to youth will be discussed. Considered together, these psychological processes have important implications for understanding how consumers make judgments and decisions and for how policymakers can help consumers make better judgments and decisions.

Counseling Psychology: A review of trends, development, and challenges

LEONG, F. (Michigan State University), SAVICKAS, M. (Neoucom), LEACH, M. (University of Louisville)
In this presentation, my colleagues (Mark Savickas and Mark Leach) and I will provide an overview to the field of Counseling Psychology as one of the specialties within applied psychology. We begin with an historical overview, followed by an attempt at defining the field in relation to some similar and overlapping specialties. Next, we attend to the trends and key developments within the field, emphasizing an international perspective. We end the chapter with a discussion of the challenges and opportunities for this field as well as an articulation of the potential future developments in the field. We wanted to point out that there is a heavy focus on the field from the perspective of the United States, not because of its superiority but because the field has been most active within that country. For example, despite its long history, the International Association of Applied Psychology did not include a division on Counseling Psychology until 2002. Only recently, has there been a growth of counseling psychology training programs and research activities outside of North America. In most countries around the world, psychological training and research related to mental health had been provided primarily by Clinical and School psychology for the past several decades while Counseling Psychology was strongly embedded and isolated in the mid-western part of the United States.

**Group trauma, oppression and liberation: Exploring principles of emancipatory practice in communities**

MOANE, G. (University College Dublin)

Community psychologists share an interest with many other areas of psychology in developing praxes that can enhance wellbeing and social justice. Yet as psychologists engage with diverse groups and communities characterized by trauma, marginalization and oppression, the limits of traditional psychological interventions have become apparent. Many approaches have been criticized for excluding the voices of those who are marginalized, for insensitivity to specific local conditions and for possibly reproducing conditions of inequality and powerlessness. In the Irish context such criticisms have emerged most recently from survivors of abuse in institutions run by the Catholic Church. While approaches based on clinical psychology, counseling and psychotherapy have had a vital role, survivors have also sought other forms of healing, support and solidarity from psychologists. A key principle for psychologists working with survivors and other marginalized groups in communities is that of working as partners rather than as experts. However the enterprise of working in partnership or solidarity often involves working across boundaries of power and privilege, with the accompanying risks for psychologists of reproducing power inequalities and oppression. Working in partnership thus calls for both a critique and the development of new principles for practice that can be emancipatory. This paper will aim to identify principles underlying emancipatory practice drawing particularly on specific examples of feminist and liberation psychologies as they have been applied in local (Irish) and global contexts. Both feminist and liberation psychologies have common roots in liberation and anticolonial movements and share efforts to foster liberating individual and social transformations that would help to attain healing and social justice. Both seek to develop bottom up approaches involving participatory practices that facilitate healing, giving voice, recording and inscribing experiences, working in alliance and forging connections with other groups and agents of change. Participatory methods are an essential element in bottom up approaches. Such methods include participatory action research (PAR) and participatory pedagogies that involve creating dialogical spaces, often across differences of class, ethnicity, nationality and other dimensions of privilege and inequality, posing challenges that have been much discussed in feminist, liberation and critical psychologies.

**Heteronomy and autonomy in learning and instruction: Roots, concepts, and functions of a basic issue**

NENNIGER, P. (University of Koblenz-Landau)

Discussions about value, place, conditions and effects of heteronomous and autonomous learning already refer to a centennial tradition in philosophical, educational and instructional areas. In psychology and education there exists meanwhile a widespread and heterogeneous
corpus of theoretical concepts as well as a large field of applicable contexts which are – not surprisingly – accompanied by increasing, but sometimes contradictory needs for a more differentiated, but simultaneously also a more coherent understanding of this issue. In our days most key-concepts refer to theories about self-directed or self-regulated learning, especially if associated with instructional issues or with themes about lifelong learning. However, already a short look on the history of ideas related to this topos highlight the multiple pathways behind which have to be considered if not only an extensive and perhaps superficial but a comprehensive and profound understanding should be achieved. For this reason the lecture starts with a sketch of philosophical ideas about autonomy and heteronomy in education, which is followed by a short outline of the most important historical and systematic roots of this phenomenon, mainly within the body of learning and instruction. On this foundation, basic psychological concepts founding most theories of self-directed or self-regulated learning are exposed in order to critically discuss the state-of-the-art of the respective research, including an analysis of the respective level of empirical evidence. In consequence of the results from the above deliberations, meaning and importance of autonomy and heteronomy in learning as well as their functions within various educational and instructional contexts are revisited and a list of their most important characteristic effects will be established. The lecture concludes with an outlook on aims and desiderata for further theoretical and related methodological developments and a perspective of areas for future promising applications.

A century of Psychology and Law: Successes, challenges and future opportunities

OGLOFF, J. R. P. (Monash University)

While it is difficult to mark the true beginning of the field of psychology and law or “legal psychology,” a conventional marker is Munsterberg’s seminal work, On the Witness Stand: Essays on Psychology and Crime (1908). In the book, he wrote that “my only purpose is to turn the attention of serious men to an absurdly neglected field [psychology and law] which demands the full attention of the social community” (Munsterberg, 1908, p. 12). The existence of the contemporary field of psychology and law has therefore now passed the first century mark. Given that milestone, it is appropriate and fitting to reflect on the development of the field. Having spent more than 25 years in the field, this is a particularly exciting opportunity. It is my view that by considering the development and progress of the field, we may be able to identify some successes, challenges and ultimately future opportunities. In this talk, I will consider the early development of the field. Many will be surprised to learn of the rather inauspicious beginnings of the field that essentially led to its demise by the Second World War. The modern rise of psychology and law really began in the 1960s and has continued ever since. Two areas of research that have led to successes in practice and policy development will be briefly reviewed. The first is an area in which I have worked for many years, the prediction of risk for violence. This area comes from the area of clinical forensic psychology. To demonstrate an example from experimental psychology, I will also briefly note that considerable advances that have been made in the police line-up literature that is derived from the eyewitness testimony literature. Despite the successes, many challenges exist and will be discussed. Finally, the presentation concludes with a review of some of the factors that I believe are necessary to realise future opportunities for the field.

Psychology and societal development

PANDEY, J. (Central University of Bihar)

Disparities in the level of socio-economic development across as well as within nations have a long history. Analysis of socioeconomic development is an interdisciplinary subject which has not received much attention of psychologists. Psychology’s pre-occupation with covert mental processes in a de-contextualized manner and its commitment to individualism drastically undermined its engagement with macro level societal problems. It is argued that psychological theories being products of specific cultural milieu function inadequately in non-western societies, limiting use of such
psychological theories. Thus, psychological knowledge and practice imported from west have limitations. The paper examines progress and potentialities of indigenous psychologies in understanding societal development.

New developments in Occupational Health Psychology

PEIRO, J.M. (University of Valencia)

Occupational Health Psychology (OHP) has progressively been established as a discipline during the last decades. In the last decade, important developments have taken place and new approaches and extensions have been produced. A positive psychology perspective is being introduced in this discipline as well as a stronger emphasis on internationalization. In the present State Of The Art keynote the scope of the field and the recent developments of the discipline will be analyzed. Special attention will be paid to employer-employee relationships, work design and work systems improvement; organizational climate; the role of leadership in occupational health; recent developments of work-stress research and work-life conciliation. Several opportunities and challenges will be considered for the development of this discipline during the near future in the global context of our societies.

Cross cultural psychology

PENG, K. (University of California)

Abstract not available at time of publication

Clinical child psychology: A specialty for research and practice

ROBERTS, M. (University of Kansas)

Clinical child psychologists provide services and conduct research on a wide range of problems and psychological concerns. This presentation will describe the development of clinical child psychology as a research and practice specialty of applied psychology which seeks to investigate and remediate mental health problems for children, adolescents, and their families. The worldwide needs are immense for improved scientific understanding of children's mental and behavioral disorders and for quality preventive and clinical services. The epidemiology and range of children's mental health problems appears to be similar for developing and developed areas of the world. Thus, aspects of clinical child psychology are found in different countries with a broad range of populations, settings, problems, assessment, and intervention techniques. These will be described with examples representing some international diversity. The range and scope of research and practice in this specialty will be examined in terms of how specialists are trained and where they function (including independent and group practice, schools, mental health centers, pediatric primary care and children's hospitals, universities, and research institutes). Innovative trends will be described in the specialty including developmental psychopathology, evidence-based practice, cultural competence pediatric psychopharmacology, and pediatric psychology. This presentation will illustrate some of the formal actions in specialty recognition in various forms in different countries. Particular challenges and opportunities for advancement will include evidence based practice outside of research clinics, training issues and competencies in clinical child, continuing education and enhancing practitioner competencies, reimbursement, and funding for services and research. The future developments of the field will require attention to such elements as diagnostic developments, treatment innovation and implementation, serious emotional disturbances, community violence, effects of community violence, trauma, war, and terrorism, interdisciplinary research and practice, pediatric psychopharmacology, clinical child neurosciences, and genomics.

What's new in work psychology?

ROE, R. (Maastricht University)

Work Psychology is one of the oldest areas of applied psychology, originally dealing with accident prevention, work and rest scheduling, and job and work place design. This address describes how work psychology has evolved in response to changes in the nature of work, the
adoption of new technologies, novel approaches to organizing and changing work-careers in men and women, and how it has developed its own theories and knowledge base over the years. A brief outline is given of the main theories, with an emphasis on the performance of complex tasks and various types of regulation (activity, energy, emotion, health) underlying performance processes, and how these theories can contribute to identifying, preventing and resolving problems in the domain of work as well as in adjacent domains (e.g. traffic). Next, a number of trends in work are reviewed, including changes from individual to team work, from face-to-face to mediated work, from single role to multi-role work, from stable work time and workplaces to flexwork and virtual work, and from leader-managed to self-managed work. Changes regarding the use of time, in terms of meeting deadlines as well as managing the work career are considered as well. Overall, researchers in Work Psychology have effectively responded to these trends, allowing practising work psychologists to offer helpful assistance to working people and their families, as well as to managers and policy makers. Examples of new methods and techniques will serve to illustrate this. Yet, the ongoing nature of the changes, the high rate of change and the increasing impact of cross-national contexts, keep posing new challenges that work psychologists will have to address. A brief discussion of these challenges will conclude this address.

Clinical neuropsychology: Research and practice

RUFF, R. (University of California - San Francisco)

Clinical neuropsychology is a field of study focused on the relationship between brain and behavior. In its 60 year history, the focus has shifted from localizing brain tumors to providing quantitative descriptions of those cognitive and emotional domains that are compromised in patients with a wide range of neurological and psychiatric disorders. The underlying theoretical construct for the cognitive domains that are assessed includes the following: (1) sensory and motor skills, (2) attention and concentration, (3) language skills, (4) visuospatial reasoning, (5) memory and learning, (6) executive functioning, and (7) intelligence. As to the assessment of emotional functioning, the challenges involve estimating premorbid personality traits in order to determine potential changes due to brain damage. Neuropsychological services have been specifically adapted to meet the different needs of seeing patients in the inpatient versus outpatient setting. Finally, future directions for the discipline of clinical neuropsychology will be discussed.

Psychology and the protection of refugees and conflict-affected populations

STEEL, Z. (University of New South Wales), BATEMAN STEEL, C.R. (University of New South Wales)

Forced migration is commonly associated with extreme mental stressors. Violence, conflict, social and economic degradation, dislocation, loss, and instability all create a picture of immense vulnerability for affected persons and populations. The mental health consequences of such conditions have made it incumbent on psychology to play a multitude of roles in documenting, assessing, and intervening to support those affected at all stages of the process of forced migration. This State of the Art presentation outlines the historical development of the complex relationship between psychology and the experience of forced migration. The development of the trauma model with particular emphasis on the diagnosis of posttraumatic stress disorder has allowed psychologists and mental health professionals to document the mental health consequences of forced migration. This has been pivotal in promoting a global campaign to promote and protect the human rights of refugees and civilian populations affected by mass conflict in the developing world. More recently the trauma model has been pivotal in documenting the adverse mental health consequences of policies of deterrence that have been used by Western governments to limit the flow of asylum seekers internationally often at great cost to those subject to the policies. Refugee determination is a particular area that has emerged requiring specialist psychological input. An increasing body of evidence suggests that decision makers consistently misinterpret the mental health effects of traumatic stress as
evidence that undermines the credibility of refugee applicants. There is substantial need for improvement in the inclusion, quality, and use of psychological evidence to avoid situations where bona fide refugees are returned to situations of extreme danger due to poor determination procedures. The address also reviews the cultural critique of the trauma model with a particular focus on the rights of refugees communities to determine how to respond to their own history of suffering. In conclusion a model that may provide a valuable tool for continued engagement in supporting forced migrant mental health is proposed.

The state of the art in rehabilitation psychology

STIERS, W. (Johns Hopkins University School of Medicine)

It is estimated that 10% of the world's population, approximately 650 million people, experience some form of disability. Rehabilitation Psychology is a specialty which applies psychological knowledge and skills on behalf of individuals with physical and cognitive impairments and chronic health conditions in order to maximize their health and welfare, independence and choice, functional abilities, and social role participation. Dr. Stiers (Past-President of the Division of Rehabilitation Psychology of the American Psychological Association) will discuss theoretical models of disability, and their relation to the field of Rehabilitation Psychology. He will discuss the historical development of Rehabilitation Psychology, its current state, and its relevance to important on-going world health needs. Dr. Stiers will also discuss the evaluation of Rehabilitation Psychology training, including a structure/process/outcome model for evaluating programs, and the use of observational behavioral check-lists for evaluating students. He will also suggest pathways for the future development of Rehabilitation Psychology.

Applied sport psychology: Beware the sun, Icarus

TERRY, P. (University of Southern Queensland)

Most people involved in sport freely acknowledge that the quality of their performance is subject to significant fluctuations that are often driven by psychological inconsistencies. Great champions such as Michael Phelps, Maria Sharapova, Cristiano Ronaldo and Rafael Nadal have all used sport psychology techniques to enhance their own impressive performance levels. Applied sport psychology, however, is not necessarily about developing sporting titans or even about performance at all. It is, in the broadest sense, about using psychological principles, knowledge, strategies, and techniques to address any issue in sport. In this presentation, I will trace the historical progress of applied sport psychology from the very earliest writings and investigations in Europe, Asia and North America through to the current state of the art across the globe. Along the way, I will present some of the landmark publications and key developments, address past trends, present challenges and opportunities, and predict future developments in the field. Two enduring challenges for applied sport psychology are, firstly, to educate the sporting community and the general public about what sport psychology can and cannot achieve and, secondly, to ensure that claimed benefits are pitched at the right level and are supported by compelling evidence. Just as, in Greek mythology, Icarus flew too close to the sun, melted the wax that held his wings together and fell to his death, so the profession of applied sport psychology risks losing its credibility if practitioners over-promise on what can realistically be achieved and then fail to deliver on their promises. Equally, if applied sport psychologists downplay the performance gains and the other benefits that their profession can deliver (perhaps the equivalent of Icarus remaining with his feet firmly on the ground) then the sports world will look elsewhere for specialist assistance.

From studying cognitive systems to developing cognitive technologies

VELICHKOVSKY, B.M. (Dresden University of Technology and Kurchatov Research Center)

Research on human cognition immensely benefited from application of methods and models of natural sciences. Within the NBIC-
framework [1], one could expect a strong feedback from cognitive studies to the fields of computer sciences, molecular biology and nanotechnology. To find these synergies we investigated brain mechanisms of active vision and their implications for the development of innovative human–computer interfaces. Fast video-based eyetracking is the method of choice in analyses of visual cognition. As a matter of fact, eye movements are a common output of a number of philogenetically evolved brain systems. In the talk, we demonstrate how eyetracking analysis disentangles these influences on task solution completing data obtained with neuroimaging methods. Three groups of tasks are considered, with corresponding paradigms of eyetracking and neuroimaging. The first paradigm consists in the analysis of distractor influences on the duration of fixations in free exploration of complex images. The second investigates the role of attention in the perception of static and dynamic visual scenes. Finally, we demonstrate the role of social gaze in processes of communication. Different brain systems are at play in regulating parameters of eye movements in these experimental situations, from low-level midbrain structures to those of medial prefrontal cortex. Therefore, by monitoring human eye movements one can conclude on the work of these brain systems and on the task at hand. We analyse implications of these findings for designing the next generation of cognitive technologies such as adaptive assistance systems as well as attentive and multimodal interfaces ([2, 3]). At the end, we address a broader perspective on evolution of converging technologies within the NBIC-framework.

Clinical Health Psychology

WEINMAN, J. (Institute of Psychiatry)

Clinical Health Psychology is often represented in quite a narrow way as the application of psychological interventions in patients with physical health problems. The interventions used are typically cognitive-based approaches from clinical psychology, and these have been used with patients with a wide range of physical health problems, predominantly to facilitate better coping and to deal with illness-related distress. However this presentation will attempt to provide a much broader overview of the area by focusing on a range of psychological processes in healthcare, particularly the role of patients’ beliefs in response to symptoms, investigations, illness and treatment, and will provide a unifying theoretical model which underpins all these processes. Thus the overview will begin with an introduction to Leventhal’s Self-Regulation Model, as this will be used to explain variations in the way people respond to symptoms, illness and treatment. In overviewing the research on responses to symptoms, the main focus will be on ways in which patients’ cognitions contribute to delay in help-seeking and to the extent they are reassured by the findings from investigations which are carried out to diagnose the causes of their symptoms. The range of patients’ responses to illness will be examined together with the role of illness perceptions in explaining this variation and in providing the basis for interventions to improve illness-related behaviours and health outcomes. A broader consideration of the contribution and efficacy of psychological interventions in chronic physical illness will also be presented. The final part of the talk will focus on patients’ responses to treatment, and the ways in which patients’ beliefs can influence this. This will overview recent research showing the importance of beliefs about illness and treatment in motivating adherence to treatment, as well as in influencing both placebo and nocebo responses. In providing such a broad overview of current
research in clinical health psychology, it is hoped that this talk will capture the breadth and potential of this fast growing area of applied psychology.

Organisational Psychology

WOOD, R. (University of New South Wales)

Organizational Psychology (OP) is a constantly evolving discipline in which researchers seek to understand, predict, and explain the behavior of individuals and teams and to propose solutions to emerging organizational problems. A diverse range of theories are used in the study of organizational phenomena, including theories that are imported from basic psychology and theories that have been developed within the OP field to explain specific organizational phenomena such as goal setting, leadership and organizational citizenship. The building blocks of OP, including organizational context, personal factors, performance, well-being and turnover, and the interactions between individual and organizational contexts are reviewed. This is followed by a selective review of topics that illustrate the range and contributions of OP research, including leadership, teams, discretionary behavior, both positive and negative, justice, and organizational culture. The different roles of OP researchers, consultants and practitioners are discussed and we conclude with a discussion of the challenges and opportunities for OP arising from globalization, technology developments and concerns about the environment and sustainability within organizations.
Abstracts of the 27th International Congress of Applied Psychology

Presidential Addresses
The impact of the internet revolution on tests and testing

BARTRAM, D. (SHL Group)

I will outline the way in which the internet has produced a major change in the way assessment is carried out in work and organizational settings. Not only has the volume of test use increased dramatically with the advent of internet testing but also the way in which tests are used has changed. The internet has heralded a revolution in practice as great as or greater than that brought about by Gutenberg’s invention of moveable type. It has not only increased accessibility to information for people all around the world, but it has changed the way people use information. In testing, unproctored or unsupervised modes of assessment have been the biggest growth area and the most controversial, raising issues of test security, increased possibilities of cheating and candidate authentication as well as bringing enormous benefits for both employers and candidates. The relationship between test vendors, their clients and test takers has also changed as has the role of the psychologist in the test design, development, delivery and application processes. I will argue that while these changes are radical ones that sometimes challenge our assumptions about what constitutes good practice, technology, both in the realms of IT and in psychometrics have developed to meet these challenges.

Adolescent political activism and happiness across the lifespan

BOEHNKE, K. (Jacobs University)

The Presidential Address of Division 11, “Political Psychology,” concentrates on presenting one study that encompasses reference to the core topic of the division: Peace Psychology. Utilizing latent growth modeling, the long-term development of worries among 220 peace movement supporters is examined. Data originate from a seven-wave German longitudinal study started in 1985 with an average 14-year-olds. Waves were interspersed 3 ½ years each. Activists are assumed to have lower (self-related) microworries (H1) and higher macroworries (concerned with larger entities; H2) than non-activists at the onset of the study. Activists who appraised the threat of nuclear war as high in 1985 are assumed to report better mental health 21 years later (H3) than non-activists and activists who did not perceive a high threat. Activists are assumed to express relatively more macroworries than non-activists in mid-adulthood (H4). All four hypotheses were confirmed. Results are interpreted in a stress-coping (Lazarus) and resource (Elder) framework, suggesting that agency vis-à-vis perceived sociopolitical threats is an indicator for good individual coping resources that foster a positive mental-health trajectory.

Professional practice Settings - on-line, off-line, in the community, in the office

GORDON, A. (Private Practice)

In its early conception, professional practice for a psychologist involved the expert sitting in the office and being visited by the supplicant. The psychologist ran the show, took responsibility, was the law. Times have changed. Registration and accreditation issues, licensure of the psychologist, codes of conduct ... the psychologist has to play by the rules and those rules are transparent and accessible to the discerning client. Clients now can receive therapy in a variety of modes - face-to-face, electronically, individually, in a group. Health records can be accessed by other staff. Self-help manuals prevail. Scopes of practice often include individuals and communities in trauma, or recovering from traumatic events. Conditions for some clients are far from optimal - homeless, detained, traumatised. For some, the hurt is inter-generational and it may be impossible for the individual practitioner to heal. When should we stop trying? Do the rules of professional practice allow us to care for others and ourselves in the most effective ways? Where is the line between professional and personal drawn in such situations? How can professional practising psychologists impact the world for good?
Proactive coping, positive affect and well-being

GREENGLASS, E. (York University)

Traditionally, psychological research has focused on negative states, their determinants and consequences. Psychology’s focus on the study of negative constructs has tended to obscure the role of positive constructs in psychological functioning. Subjective feelings of well-being are characterized by positive mood, feeling energetic and perceiving obstacles as challenges rather than threats. Increasingly, research is focusing on factors that contribute in a positive way to psychological well-being and flourishing in human beings. This presentation will address some of the current theoretical, methodological and practical considerations associated with positive constructs and their role in psychological functioning. For example, positive emotions may have a broadening effect on cognitions and mood, thus releasing the hold that negative emotions have on them. Positive emotions may also diminish negative emotions by inhibiting their effects. Evidence consistent with this perspective is seen in research showing that people might improve their psychological well-being and physical health by cultivating experiences with positive emotions at opportune moments to cope with negative emotions. Additional research suggests that positive affect is a function of social support and coping strategies. The idea that coping may have positive utility parallels recent research highlighting the role of positive beliefs and emotions in the promotion of health. Data are presented here to indicate that proactive coping promotes positive mood and motivational states. Proactive coping involves goal setting, having efficacious beliefs, and is associated with resources for self-improvement. Since it is associated with self-efficacy and vigor, demands are perceived as a challenge rather than a threat. The inclusion of positive coping is innovative in that its focus is not so much on just responding to negative events, but instead includes a broader range of cognitions and behaviors involving active construction of opportunities and the positive experience of stress. In addition, the mediating role of positive constructs is considered as is their motivational role with reference to behavioral and cognitive spheres. Theoretical implications of the study of positive constructs, social support, coping and their relationships, are explored particularly with regard to improvement of psychological health and promotion of feelings of well-being.

Emotion-focused and action-focused coping in sport

HANIN, J. (Research Institute for Olympic Sports)

This presentation re-examines traditional distinction between problem-focused and emotion-focused coping reflecting the link between stressful events and the stress-response (Lazarus & Folkman, 1984). Alternative approaches to coping in high-achievement sport is based on the Individual Zones of Optimal Functioning (IZOF) model as applied to pre-competition anxiety, performance-related emotions, and performance process. The following will be discussed: (1) Coping process is multi-modal and not limited to “cognitive and behavioral efforts”. Coping targets can be motivation-centered, volition-centered, bodily-centered, action-centered, and communication-centered; (2) Coping is not limited to managing only negatively-toned emotions because negatively-toned emotions are not always detrimental for athletic performance and positively-toned emotions are not always beneficial for all performers; (3) The distinction between state-trait-meta experiences is helpful in the selection of effective coping strategies. State-like emotion intensity (optimal, dysfunctional, and actual) is first identified; trait-like emotion patterns indicate if they can be potential barriers to coping. Finally, meta-emotions as attitudes about experiencing specific emotions indicate if re-framing of existing meta-experiences is needed; (4) Emotion-focused coping uses a set of mental skills directed at optimization of emotional states by maximizing impact of functionally optimal emotions and minimizing harmful effect of dysfunctional emotions. Emotion-focused coping aims to reduce the probability of random and habitual errors whereas disrupted performance triggers dysfunctional emotions and action-focused coping can be more effective; (5) Action-profiling within the framework of the Identification-Control-Correction (ICC) program (Hanin & Hanina, 2009)
provides a tool for dealing with inconsistency of athletic performance (instability of technique, a "lost move syndrome", and "habitual" performance errors under competitive stress. The optimization of action process triggers functionally optimal emotions; (6) Coping should consider the temporal patterns in emotion-performance relationships in pre-task, mid-task, and post-task stages of performance process. Thus reactive coping targeted on current or past experiences and anticipatory coping focused on the future should be clearly distinguished. To conclude, emotion-focused and action-focused coping in high achievement sport represent a comprehensive program of optimization of athletic performance enhancing cooperation between athletes, coaches, and sport psychologists. The approach is practitioner-oriented and provides a framework and tools for optimization of athletic performance and enhancement of consistent excellence.

**Human development and societal development: Is psychology relevant to global human development issues?**

KAGITCIBASI, C. (Koc University)

The title of this talk is the same as the title of my 1992 Presidential Address at the Cross-Cultural Psychology International Congress. The subtitle is the same as the title of my APA Award Address presented in 1994. Close to two decades have passed since then, and the issues involved are still very much with us. This is the reason for using the same titles at this time. 'Human Development', as constructed by UNDP, derives from the recognition that societal development goes beyond economic development, including education, health and societal well-being in general. Psychology as a science and profession, particularly in terms of large scale applications, can and should be relevant for overall human development. Indeed, the science of psychology, just as any other science, should be accountable to society. However, psychology has remained rather 'estranged' from the important societal issues in the 'Majority World'. It has yet to develop as a policy science. Two main reasons for this are its predominantly individual focus on the one hand, and its Western outlook on the other. Thus, while psychology has accumulated a great deal of knowledge and know-how toward enhancing human well-being, it is hardly seen as important for societal development efforts. The lack of involvement of psychologists with societal human issues also derives from their own unawareness of the relevance of their knowledge for such problems. An important task for IAAP and particularly for its Division, 'Psychology and Societal Development' is to work hard to change this state of affairs. A new identity and role definition are to be devised for psychology as a science and profession in the service of global human well-being. Toward this goal, the accumulated knowledge of Western psychology could be supplemented by endogenous knowledge derived from the rest of the world toward creating 'integrative syntheses.' An applied psychology which is informed by such new knowledge, could aspire for universal validity and be truly relevant for the solution of societal, even global human development issues.

**Work and Organizational Psychology in a global context**

PEIRO, J.M. (University of Valencia)

Globalization is a phenomenon that is impinging the economy, markets, work, labour and organizations in many ways. Work and Organizational Psychology is currently being challenged by this reality and new demands appear for research, education of W&O Psychologists, and professional practice. New opportunities emerge for scientists, scholars and practitioners that require new initiatives and approaches. In the present address the main implications of these emerging phenomena for research (such as cross-cultural approach, and widening the study of the contexts to provide better and more contextualized evidence), education (cooperation for promoting internationalization of teaching and learning, joint programs) and professional practice (competences for working as a practitioner in different contexts and internationally) will be analyzed and discussed. Also the humanitarian cooperation in the field of Work and Organizational Psychology will be considered. Finally, the challenges for IAAP Division 1 and for W&O Psychologists will also be presented. Special attention will be paid to the Alliance for...
Organizational Psychology which is being launched by IAAP-Division 1 SIOP and EAWOP.

**Psychology in the 21st century: Challenges for psychology students**

POTOCNIK, K. (University of Valencia)

A range of important changes in psychology training around the world has taken place in the past decade. Regarding Europe, a significant reform has taken place in order to enhance the employability and mobility of citizens and to increase the international competitiveness of European higher education. Within the context of this reform, European Diploma in Psychology (EDP) has been developed, aiming to set a standard for psychology education and practice. According to these new European standards, a Masters degree and one year of supervised practice are considered as a minimum level of training for future professionals (Lunt, 2005). In contrast, in the USA, a Doctoral degree and a year of internship are set as minimum level of training for psychologists. According to recent changes, students can move from internship to licensure without the requirement of a post-doctorate experience (Hasan & Jeong, 2009).

Also in Latin America there have been reforms in psychology teaching and training with attempts to implement common psychology education across different MERCOSUR countries (Peña, 2009). Thus, psychology teaching and training has changed considerably over past years. However, what is not as clear is what students’ attitude towards these issues is. What do students think about their training? How satisfied are they with it? Can they manage well with all academic obligations? Do they feel capable of carrying out meaningful research? Do they feel they receive enough training to start a professional career? Overall, are they satisfied with their career choice? This presidential address will aim to reply to these questions by means of a survey applied to psychology students from different countries studying at undergraduate as well as at postgraduate level. In addition, the role of IAAP Division 15 in stimulating student participation in the development of our science and profession will be analyzed. Finally, some challenges that could be addressed by Student Division in the future will be outlined.

**Treatment of depression: A component analysis**

REHM, L. (University of Southern California)

Many therapy manuals exist for the treatment of depression. Most have some empirical support, but they come from different theoretical orientations and make different assumptions about the nature of depression. These manuals also have many components in common. This paper is an attempt to identify and logically group therapy components across manuals. Some are unique to one manual, but most are at least similar in two or more manuals. Some suggestions are made concerning what presenting circumstances might be matched with what component, and how components might be sequenced in treatment planning. Therapy components can be considered the basic competencies of treating depression.

**The role of moral sentiment in economic decision making**

TYSZKA, T. (Centre for Economic Psychology and Decision Sciences)

Three questions will be discussed in some depth: (1) How do people resolve conflicts between moral sentiments (guilt, gratitude, etc.) and economic self-interest? Do they make trade-offs between moral and material consequences, or do they use decision strategies that do not require such trade-offs? The answer seems to depend on how strong is a moral sentiment associated with violating a given moral norm; (2) How much considerations of justice matter in economic decision making? Research shows that justice consideration can influence preference for income distributions. However, in ranking of the principles of justice in an “abstract” way (merely expressing an opinion) people declare preference for another principle of justice than the one they follow in situations of choice with financial consequences. For example, the principle of Minimizing the Income Range receives very high rank in “abstract” ranking, while this principle is the least popular in choice situations; and (3) Trust and mistrust in economic decision making. Large discrepancy between people’s stated and actual trust in
Abstracts of the 27th International Congress of Applied Psychology

others can be observed. People often say they distrust others, while in their economic interactions with others, such as trust game, they behave as if they trusted others. What is an actual motivation behind such behavior? This might have something to do with preserving one’s moral self-image.

Counselling Psychology: The ways forward

YOUNG, R. A. (University of British Columbia)

The aim of this presentation is to address and delineate the ways forward for the discipline and practice of counselling psychology in national and international contexts. Two aspects of the ways forward are included: first, the ways forward within counselling psychology and Division 16, secondly, the ways forward as a discipline in the face of public policy, the health and welfare of people generally, and broad social impact. Specific topics discussed include culture, indigenization, globalization, conceptual frameworks, knowledge transfer, and emerging definitions of counselling psychology.
The many faces of Sport Psychology: Strength or challenge for the field?

BALAGUÉ, G. (UIC Psychology)

Sport Psychology has been around for many years now, too many to be called a “young discipline”. Still, if we ask people to describe what Sport Psychology is chances are we will not get a consistent definition, often getting contradictory descriptors. This talk will attempt to describe the main areas composing the field of Sport Psychology, their irregular growth in the last 15 years, and the implications for both the academic and the applied domains. Different countries have followed different pathways, and some of these models appear to have more positive outcomes than others. Possible solutions and recommendations for training, research and applied interventions will be discussed.

School psychology across the world: Retrospect and prospect

BURDEN, R. (University of Exeter)

This presentation will review the historical development of school psychology since its beginnings in the 1920s with the aim of identifying its continuing chances of survival. Important factors and events will be highlighted to explain why school psychology practice has moved in different directions at different times and in different parts of the world. Current dilemmas threatening the very existence of the profession in countries such as the UK will be presented and alternative scenarios will be offered as to some possible directions that it might take in order to deal with these.

That’s the way the money goes: Can neuropsychological assessment sensibly inform decisions regarding financial competence?

CROWE, S. (La Trobe University)

This paper presents the results of four studies undertaken by our group which examined the ability of brain impaired individuals to perform tasks associated with financial decision making. These include the evaluation of competent use of automated teller machines, automated transport ticketing machines and automated telephone response devices, development of a questionnaire measure assessing the self-reported ability to manage money and examination of the distinction between money management skills in individuals with and without guardianship orders. The results indicated a strong relationship between neuropsychological measures and competency in automated machine use. On a questionnaire measure, neuropsychological assessment demonstrated a modest ability to predict the overall score (19% of variance), but when more specific items were used, predictive success was significantly higher. Measures of memory explained 63% of variance in whether individuals with brain impairment made late payments of bills or rent, and classification success was high (89.3% of participants correctly classified). Measures of impulse control were strongly related to problematic impulse spending. Individuals who had had administrators appointed performed significantly worse than a comparable control group without administrators on measures of executive/attentional abilities (impulse control, planning, flexibility of thinking and working memory). Suggestions for more concisely predicting problems with financial decision making arising from neuropsychological examinations are presented and the implication of these findings to more broad aspects of activities of daily living such as testamentary capacity, driving and medical decision making is discussed.

Counselling and self-organization

DAUWALDER, J.P. (Universite de Lausanne)

Counselling is a significant field of applied psychology. Mainly concerned with individual interventions 50 years ago, methods of counselling and coaching have spread since then to several broad domains. If we focus on the domain of career counselling and related fields, one might describe observed changes in
counselling techniques as a result of a co-evolution with economic trends, rather than outstanding innovation. The evolution of counselling, seen as a scientific community and its production, could therefore also be understood in terms of self-organization. Actually however, some persistent paradoxes in career counselling have to be overcome: How should we find 'person-environment fit', while eliminating context in assessment? Why prescribe careers, when clients permanently change jobs? Why believe in linear causalities in career construction, which are no more valid for daily experience? How do we understand clients, using terms and instruments which are not intelligible for them? How do we design individual projects, using normative statistics? One of the basic assumptions in counselling is, that counsellors are most efficient while helping people to help themselves. Again this underlines the idea of self-organization: Any person is inextricably situated within specific but also mutually interdependent ecological contexts. Furthermore, dynamics of interaction over time lead to co-evolution, emergence of order and self-organization in people's career and life. Therefore, at different moments of their individual lives, people are also more or less resistant to engage in a counselling process. Some of our research data confirms this observation. Different forms of quality of life have been described as emergent order parameters for self-organization in daily life by one of our studies. Interactive assessment of perceived contextual constraints and resources and their dynamics has been found to be a valuable alternative to normative testing. And finally modelisation of different patterns of interactions between counsellor and client underscores the importance of client’s learnings in terms of self-management.

But what does this mean for counseling interventions?

Coaching clients and organizations for self-awareness and perceived self-efficacy beyond the immediate effects of interventions calls for new (meta-)skills for counsellors. The recently developed perspective of 'life design' will be discussed extensively.

Violence risk assessment: Next steps toward moving the field forward

DOUGLAS, K. (Simon Fraser University)

In the past several decades, a solid foundation for the task of violence risk assessment has been laid by successive generations of research. Important violence risk factors have been identified, and useful methods of violence risk assessment have been developed and evaluated. What's next? Much contemporary violence risk assessment discourse focuses upon such concepts as risk reduction, risk management, and dynamic risk. Yet, corresponding empirical efforts lag behind these conceptual developments. In this talk, I will discuss ways in which our field might hasten and facilitate the empirical evaluation of prevailing conceptual themes in risk assessment. Broadly, this involves attempting to bring the “science” and “practice” of violence risk assessment closer together. Specifically, I will discuss several ways in which this might be accomplished, including but not limited to: (a) operationalizing, quantifying, and measuring the idiographic relevance of nomothetically-supported risk factors; (b) drawing on theories of violence to facilitate case conceptualization; (c) measuring the “integrity” of risk assessment in practice; and (d) more assertive attempts to integrate research on risk assessment and risk reduction. The ways in which the revision of the HCR-20 violence risk assessment scheme (HCR:V3) attempts to facilitate some of these goals will also be highlighted.

Psychological success factors in entrepreneurs

FRESE, M. (University of Giessen)

I propose that active actions, (i.e., being self-starting, proactive, and persistent) are central for entrepreneurship theoretically and empirically. An action theory approach to understanding of entrepreneurship is developed. I describe a number studies on action characteristics of entrepreneurs which we have performed that follow from this action theory approach and from the idea that active actions are central for entrepreneurship. For example,
active goal setting, active task planning, active approaches to dealing with errors all lead to higher entrepreneurial success. It follows that an intervention that would increase active approaches should also lead to higher performance – this is, indeed, the case as a theory driven intervention study shows.

Restorative environments research: Issues in measurement and analysis

HARTIG, T. (Uppsala University)

Starting from the early theoretical statements and empirical studies of the 1970s and 1980s, research on restorative environments has proceeded at an increasingly rapid rate. As a positive complement to research on environmental stress, restorative environments research has attracted members of social and behavioral sciences other than environmental psychology, and the potential practical value of the research has been noted in applied fields such as architecture, horticulture, landscape architecture, forestry, environmental medicine, and public health. In tandem with this growth of interest, the coverage of environments and populations has become broader and more diversified. The initial interest in the restorative values of natural environments still shows in much of the work, but more attention is now being given to restoration in settings that are not predominantly natural, such as homes, cafes, churches, zoos, and historical sites. Similarly, concern for people in cities still motivates much of the research, but the sampling of people has become more specific, following recognition of the special circumstances and restoration needs of children, parents, the elderly, people suffering from depression, socioeconomically disadvantaged people, and other groups. The expansion and articulation of the research area has entailed increased awareness of a variety of issues in measurement and analysis. I will address some of those issues in this presentation. I will first overview different types of variables of interest (including antecedent, environment, and outcome), the approaches that have been taken to measuring those variables, and some problems with those approaches. I will then consider in some detail the problems encountered in efforts to measure the components of restorative experiences specified in Attention Restoration Theory (ART), namely, being away, fascination, extent, and compatibility. Finally, I will discuss the need for analyses that more directly test claims about restorative process. By helping to address these issues, research in environmental psychology can contribute substantially to further progress in a research area of growing significance.

Educational assessment

HATTIE, J. (University of Auckland)

It has been 50 years since the origins of item response models and testing has greater benefited from these models. But so often we are using yesterday's technologies and ideas to solve tomorrow's problems. The use of tests has had a resurgence given the internet and now m-technologies and the need for different measuring models built on our past successes is needed. In schools and organisation there are exciting developments in using high quality tests in formative decision making, with the aim of changing the teachers in what they do than measuring student outcomes. The session will also outline some interactive testing technologies that can be used on the internet and m-technologies to more fully engage test takers in simulations.

Research on asian students' motivation: Themes and issues

HAU, K.T. (The Chinese University of Hong Kong)

The study of Asian students' achievement motivation has been of great interest to researchers since the 90's. Two factors have contributed to the proliferation of research in this area. On the one hand, the outstanding academic performance of certain groups of Asian students, despite their apparently less favorable learning conditions, has aroused interest in investigating the characteristics of learning and teaching in Asian contexts as well as the factors behind their success. On the other hand, psychological research has increasingly emphasized person-environment interactions as determinants of human behavior, accompanied by an increased interest in cross-cultural studies.
where theories originated in Western contexts are examined in other cultures. Studies of this kind often help to refine and expand existing theories. This paper begins by highlighting the outstanding educational performance of specific Asian groups sharing the Confucian cultural heritage. Major themes associated with this cultural context, including collectivism, the virtue orientation in learning and the high regard for educational achievement, are briefly discussed to provide a background for understanding research findings in this area. Studies and issues related to the examination of achievement goals, beliefs and interests as well as intrinsic motivation are described. Useful insights generated from these studies include the complexity of cultural differentiation, the effects of acculturation, the need for more refined instrumentation and research design, as well as the benefits of including a wider range of motivation-related constructs and outcome measures in future studies. Despite mixed findings and methodological problems associated with cross-cultural research, previous studies have largely shown that students in the Asian-Confucian cultural context display motivational characteristics that are different from those of their Western counterparts. However, much research is needed to provide more accurate delineations of and explanations for these divergent patterns.

Pitfalls and successes in creating a new testing environment in an east-european culture

ILIESCU, D. (SNSPA Bucharest)

Professional efforts to create, adapt and publish psychological tests in Romania, as in the whole area of South-Eastern Europe, have had a visible revival in the last decade, after a sad history of 20 years when Romanian psychology was banned as an academic discipline by the communist regime. The historical context of test use in Romania is of great importance when discussing current practices in test development and usage. Historical efforts (during the communist regime) to restrict psychology and its technology continue to live on in both professional and everyday attitudes towards tests and testing and are most visible in the lack of understanding of ethics associated with test use in Romania. Also, even though Russian influence is not longer of importance, the geographical and historical proximity to the USSR has shaped some of the practices and attitudes underlying testing practices in Romania even today. We will discuss the pitfalls and successes experienced during the last decade by the new spirit of test usage, development, adaptation and publishing in Romania. We will address issues in three different areas: (a) the local professional climate and its influence on testing practices, including efforts to accelerate ethical testing practices, the development of a local set of guidelines for selecting tests for adaptation, (b) procedural aspects of contacting and obtaining permission from test publishers and authors, test marketing and sales, cooperative agreements with other companies, niches in the local market, the general approach to expansion in the regional market, and (c) scientific practices in data collection and analysis, ongoing validational research, and the usage of longitudinal samples. Appropriate attention will be given to multicultural aspects, important due to Romania’s multi-ethnic population, as well as to the analysis of similarities with other SEE countries.

Aging and the effects of emotion on cognition: Implications for psychological interventions for depression and anxiety

KNIGHT, B. (University of Southern California)

The address will discuss developments in theory and research regarding emotion and aging, including Socioemotional Selectivity Theory and the positivity effect in emotion and aging. Then, recent work on age effects on mood congruence and sad mood and on attentional bias to threat and anxiety will be presented that raise questions about increased sensitivity to changes in mood even though overall mood may improve with age. The implication of these findings for adapting cognitive behavior therapies for work with older adults will be explored.

Colleagues as a defence against bad science: Gentle alternatives to whistle blowing

KOOCHER, G. (Simmons College)
Abstract not available at time of publication

The relevance and viability of subconscious goals in the workplace

LATHAM, G. (University of Toronto)

This presentation examines the relevance and viability of pursuing empirical research on subconscious goals and applying the findings in the workplace. Five topics are addresses. First, reasons why management scholars have eschewed the study of the subconscious are given. Second, a brief overview of social psychology experiments on subconscious goals is provided. Critical issues that have yet be addressed in these experiments are identified and discussed. Third, organizational psychology experiments on subconscious goals that have attempted to overcome several of these shortcomings and provide new findings are described. Fourth, research avenues that have yet to be explored are suggested. Finally, the implications of this stream for management practice are discussed.

Self-efficacy combined with social and cognitive predictors

LUSZCZYNSKA, A. (Warsaw School of Social Sciences and Humanities, and University of Colorado)

The paper discusses the processes by which self-efficacy may affect health (and health behaviors) indirectly, interacting with (or mediating) other cognitions (e.g., metacognition, action plans formation). Examples of indirect effects of self-efficacy will be drawn from studies involving adolescents, healthy adults, patients with cardiovascular diseases, HIV, general anxiety disorder, and caregivers of individuals with Huntington disease. Randomized controlled trials suggest that adding self-efficacy to a training of self-regulatory skills increases the sustainability of the effects over time. Further, a line of research involving trauma survivors (including domestic violence, military personnel deployed to Afghanistan or Iraq, breast cancer patients, and police force personnel) shows that selected cognitions interact with self-efficacy and these interactions promote posttraumatic adaptation. Discussed examples will include the relationships between self-efficacy, peritraumatic dissociation, posttraumatic growth and posttraumatic social support and their effects on cortisol levels, quality of life, substance use, anxiety, and depression.

The role of self-concept in educational psychology: A methodological-substantive research programme

MARSH, H. (Oxford University)

My self-concept research programme represents a substantive-quantitative synergy, applying and developing new quantitative approaches to better address substantive issues with important policy implications. Self-concept enhancement is a major goal in many fields including education, child development, health, sport/exercise sciences, social services, organisational settings, and management. Self-concept is a multidimensional hierarchical construct with highly differentiated components such as academic, social, physical and emotional self-concepts in addition to a global self-concept component. Self-concept is also an important mediating factor that facilitates the attainment of other desirable outcomes. In education, for example, a positive academic self-concept is both a highly desirable goal and a means of facilitating subsequent academic accomplishments. However, the benefits of feeling positively about oneself in relation to choice, planning, persistence and subsequent accomplishments, transcend traditional disciplinary and cultural barriers. My purpose here is to provide an overview of my self-concept research in which I address diverse theoretical and methodological issues with practical implications for research, policy and practice such as: Does a positive self-concept ‘cause’ better school performance or is it the other way around? Why do self-concepts decline for gifted students who attend selective schools, and learning disabled students in regular classrooms? Are multiple dimensions of self-concept more distinct than multiple intelligences? Why do people think of themselves as ‘math’ persons or ‘verbal’ persons? Can children as young as 5 or 6 distinguish between multiple dimensions of self-concept? How different are the self-concepts of bullies and victims? Does a positive physical self-
concept lead to health-related physical activity? Do self-concept models hold up cross-nationally and cross-culturally? How do self-concepts of elite swimmers from 30 countries contribute to winning gold medals? How did the fall of the Berlin Wall and the resumption of Chinese control of Hong Kong influence self-concepts?

Reappraising the transactional model of driver stress and fatigue

MATTHEWS, G. (University of Cincinnati)

The transactional model of driver stress and fatigue proposes that affective responses to vehicle operation depend critically on the driver’s appraisal of the demands of the traffic environment, and on choice of coping strategy. In this talk, I will provide an overview of four lines of research that broadly support the transactional perspective, but which also raise some issues for future research. First, there is now extensive evidence from psychometric studies that multiple dimensions of stress vulnerability may be reliably assessed, using the Driver Stress Inventory (DSI). The scales of the DSI appear to be valid for both professional and non-professional drivers. They are also fairly, though not entirely, robust across different cultures. Second, recent research confirms the key role of appraisal processes in shaping the experience of driver stress and fatigue. I will review findings from recent simulator studies of fatigue that identify challenge appraisal as a central process. Third, cognitive stress processes influence not only subjective experience but also performance and safety. Anger-prone and anxiety-prone drivers show different patterns of vulnerability to impairment, although emotional responses may not be directly connected to behavioral responses. Recent studies of fatigue show that erosion of the driver’s readiness to commit effort to the task may be especially damaging to alertness. Fourth, I will review the human factors implications of recent research. While the introduction of in-vehicle systems to aid the driver may reduce workload, such devices may be ineffective in reducing stress, and may promote a dangerously passive task strategy. On a more positive note, neuroergonomic approaches may enhance evaluations of the driver’s alertness. A new psychophysiological technique, measurement of cerebral bloodflow velocity using transcranial doppler sonography, may provide a means for tracking the loss of task engagement typical of fatigue. I will conclude by considering some challenges for the transactional approach; discriminating driver stress from other sources of stress including occupational stress, establishing the causal role of emotional responses, and the possibility of ‘implicit’ unconscious elements of the stress response.

Psychotherapy relationships that work: Evidence-based practices

NORCROSS, J. (University of Scranton)

What really works in psychotherapy? Decades of clinical experience and controlled research consistently document that the therapy relationship accounts for as much psychotherapy success as the treatment method. This invited address will present the results of multiple meta-analyses, compiled by a joint task force of the APA Society of Clinical Psychology and the APA Division of Psychotherapy, on (1) effective elements of the therapy relationship, (2) effective means of tailoring that relationship to the individual patient, and (3) discredited or ineffective relationship behaviors. The talk synthesizes two of the most crucial developments in contemporary mental health: evidence-based practices and therapeutic relationships. At the conclusion of the address, participants will be able to: (1) identify at least 3 therapist relational behaviors that demonstrably improve the effectiveness of psychotherapy with children, adolescents, and adults; (2) use at least 3 evidence-based methods to tailor the therapy relationship to the individual client in ways that enhance treatment outcome; and (3) apply the percentage of outcome variance attributable to various clinician, patient, and interactional factors.

Displaying ethical behaviors by psychologists when standards are unclear

OAKLAND, T. (University of Florida)

Psychologists recognize the need to know and adhere to the ethics code in the country or
countries in which they work. However, most countries do not have ethics codes that govern the work of psychologists. Thus, psychologists working in countries that do not have an ethics code face a dilemma: they need to behave ethically yet do not know the guidelines or standards that govern these behaviors. This presentation highlights some cross-national conditions about which psychologists should be aware when working cross-nationally, especially in countries that may lack an ethics code. These include knowledge of the host country’s prevailing moral values, its laws and administrative policies, and ethics codes as well as policies approved by international agencies and associations. Eight guidelines are provided for psychologists working in host countries that lack ethics codes.

Having a sense of one’s place: Challenges of identifying and nurturing social and environmental community affordances

PRETTY, G. (University of Southern Queensland)

This paper demonstrates how an understanding of people’s relationships with the physical spaces they occupy as home and community can contribute to our practice at individual, social and environmental levels. Community psychology suggests how a social residential community can influence the ability of its people to thrive and sustain cultural vitality with concepts such as sense of community and belonging. Similarly environmental psychology informs the understanding of the physical context of the residential community. Concepts such as sense of place, place identity and attachment suggest how spaces become places which afford inhabitants opportunities for biopsychosocial development and well being. This paper weaves these theoretical threads of community, environmental and ecological psychology and its research to describe processes by which people attribute meaning to their physical surroundings and subsequently symbolically represent them as home and community. Methods are presented for observing this fabric as a source and site for consultation regarding current individual, social and environmental challenges. Social justice issues embedded in current inequities of environmental affordances are considered from the experiences of adolescents, indigenous peoples, and rural and immigrant communities.

A psychological perspective on ‘thinking globally and acting locally’ in the context of climate change: Environmental wisdom amidst complexity, disconnects, and crucial omissions

RESER, J. (Griffith University)

The paper examines a current mantra and conventional wisdom expression with respect to the interrelated challenges of environmental degradation and climate change, to illustrate that a crucial missing piece in interdisciplinary work on climate change is that of highly relevant psychological analyses and research findings. The paper explains the nature, logic, and findings of that research which has examined environmental hyperopia, a convergent set of perceptual, media coverage, and information technology biases which selectively distorts risk perception of both local and global environmental threats and impacts. These findings and insights are then discussed in the context of a running discussion within environmental and social psychology concerning the current strategic privileging of Environmentally Significant Behaviour (ESB) change over Psychologically Significant Responding (PSR). The larger framing of current climate change discourse in terms of climate change mitigation and adaptation is then briefly canvassed, with the case made that from a psychological perspective these two processes have strong interlinkages, and that the nature, mediating roles, and importance of psychological adaptation have been almost wholly missed in current research and policy discussions on climate change adaptation. The paper concludes with the assertion that ‘thinking globally, acting locally, and responding personally’ are indeed prerequisites for sustainable, life supporting – and life enhancing - local and global ecosystems, but that the complexity of ‘climate change’, human nature, and contemporary information and communication technology ‘environments’ must be factored into climate change and sustainability science and policy considerations.
New avenues for W&O Psychology

ROE, R.A. (Maastricht University)

This lecture argues that W&O psychology needs to broaden its scope and address issues that have been understudied in the past. It explores four possible avenues. The first avenue focuses on the temporal dimension of behavioral and organizational phenomena, and aims to complement knowledge about “what is” with knowledge about “what happens”. This implies building time into models and theories, gathering time-series data, and analyzing these with methods for determining intra-subject developmental trajectories and their interrelationships. The second avenue complements the study of people as individuals with the study of people as collectives. It builds on the acknowledgment that there is always a collective dimension to human behavior, and that the individual approach sometimes fails to provide satisfactory explanations, e.g. of irrational and destructive behaviors. Distinguishing between forms of collective behavior, it proposes to study them empirically with means other than the customary questionnaire and experiment. The third avenue deals with how context shapes and influences people’s behavior. Rather than conceiving context in terms of distinct variables, it looks at contextual profiles, as present in “theaters” such as the office, the church, the battlefield. It differentiates between various “theaters” and studies the behaviors that normally emerge and their unfolding over time. The fourth avenue is about morality; it emphasizes that organizations produce “goods” as well as “bads”. Instead of depicting organizations as “neutral” functional entities, it acknowledges that they can become bodies of exploitation and repression, which damage their social and physical environment. It seeks to explain the origins of “goods” and “bads” (e.g. incidents and scandals) and to establish what can be done about it. Each of these avenues can contribute to innovation in W&O Psychology, calling for new theoretical approaches and research methods, but also promising new insights and more effective interventions.

Health behaviour change: Mediators and moderators

SCHWARZER, R. (Freie University of Berlin and York University)

Health-compromising behaviors such as physical inactivity and poor dietary habits are difficult to change. Most social-cognitive theories assume that an individual’s intention to change is the best direct predictor of actual change. But people often do not behave in accordance with their intentions. This discrepancy between intention and behaviour is due to several reasons. For example, unforeseen barriers could emerge, or people might give in to temptations. Therefore, intention needs to be supplemented by other, more proximal factors that might compromise or facilitate the translation of intentions into action. Some of these postintentional factors have been identified, such as perceived self-efficacy and strategic planning. They help to bridge the intention-behavior gap. The Health Action Process Approach (HAPA) suggests a distinction between (a) preintentional motivation processes that lead to a behavioral intention, and (b) postintentional volition processes that lead to the actual health behavior. In this address, seven studies are reported that examine the role of volitional mediators in the initiation and adherence to five health behaviors: physical exercise, breast self-examination, seat belt use, dietary behaviors, and dental flossing. The general aim is to examine the applicability of the HAPA and its universality by replicating it across different health behaviors, based on various measures, time spans, and samples from different countries.

A psychological perspective on sustainable transport

STEG, L. (University of Groningen)

Many believe that changes in travel behaviour, in particular reductions in car use, are needed to reach a sustainable transportation system. In this presentation, I will discuss how traffic psychologists can contribute to achieving sustainable transportation by changing individual travel behaviour. I argue that traffic
psychologists should address three issues to promote sustainable transportation. First, it is important to identify factors underlying travel behaviour, as transport policies will be more effective if they target important antecedents of the relevant behaviour. Second, traffic psychologists should study which interventions will be effective and acceptable to change travel behaviour and to promote sustainable transportation, including informational and structural strategies. Third, it should be studied to what extent interventions affect individual quality of life, as an environmentally sound transport system can only be considered to be sustainable when individual quality of life is secured. I will present results from studies conducted at the University of Groningen that address these three issues. Moreover, I will provide recommendations for future studies, and suggestions on how to achieve a sustainable transport system.

**Driver behaviour theory: ninety years of psychological space in traffic**

SUMMALA, H. (University of Helsinki)

With experience, car drivers learn to manage with risks on the road surprisingly well. But what are the critical measures that the drivers actually control while driving? Plenty of candidates have been presented by psychologists who often are eager to explain behaviour with one or few variables: attention, comfort, crash-risk itself, feeling of risk, effort, mental workload, task difficulty, and so on. This presentation follows one line of theorizing that dates back to the late 1910's - that of psychological space. Ninety years ago a Swedish engineer Chr. Sylwan looked down at busy street traffic from a skyscraper in New York and described the space required by vehicles and the psychological space in front of and on both sides of vehicles, as determined by speed and anticipated paths of traffic units. Twenty years later Gibson and Crooks in their now well-known work vividly described the field of safe travel, the field of possible paths which the car may take unimpeded. Another thirty-five years later we investigated safety margins in space and time as important roles in our motivational model of driver behaviour. The "zero-risk theory" essentially suggested that the driver tends to satisfy his (excitatory kind of) motives in traffic but so that he/she feels no risk. It postulated a risk monitor that alerts and triggers an avoidant reaction when a safety margin threshold is violated or violation is anticipated. Safety margins and elicited emotional reactions were suggested to serve as simple heuristics in dynamic driver behaviour just as optimising subjective utility models have been substituted by the satisficing principle and simple decision heuristics in more static decision making. This was in line with Antonio Damasio's hypothesis, now achieving increasing interest among driver behaviour theorists. Road space allocation and safety margin control are now an essential goal in the intelligent vehicle and road concepts. However, we suspect that many years from now drivers will utilise the control loop which maintains safety margins, that is, keeping themselves within a safe "psychological space", or "safety zone", or "safety envelope" - through speed, steering, and attention control. This old concept will be put into the context of the present motivational and cognitive models of driving behaviour.

**On the role of passion for sport and physical activity in a fulfilling life**

VALLERAND, R.J. (Université du Québec à Montréal)

Recently, Vallerand and his colleagues (2003) have proposed a new conceptualization of passion. Passion is defined as a strong inclination or desire for a self-defining activity that we love, value, and spend a considerable amount of time on. Two types of passion are proposed: a harmonious and an obsessive passion. Obsessive passion is involved when people feel that they can't help themselves and have to surrender to their desire to engage in the passionate activity. It is as if the activity controlled the person. Obsessive passion results from a controlled internalization (Deci & Ryan, 2000) of the activity in the person's identity. On the other hand, harmonious passion refers to a strong inclination for the activity that nevertheless remains under the person's control. The person can choose when to and when not to engage in the activity, thus preventing conflict from arising between activity engagement in the passionate activity and other life activities. Harmonious passion results from an autonomous internalization of the activity in
identity. In this address, I review research that reveals that harmonious passion toward sport and physical activity is typically associated with adaptive outcomes while obsessive passion is related to less adaptive and at times maladaptive outcomes. These findings have been obtained with respect to a number of affective, cognitive, mental and physical health, relationships, and performance variables with diverse populations. I also address the role of personality and social variables in the development of passion. Finally, some directions for future research are proposed.

Cross-cultural assessment: The next generation

VAN DE VIJVER, F. (Tilburg University)

It is argued that adequate cross-cultural assessment is based on a productive synthesis of cultural and substantive considerations on the one hand and appropriate methods (design and statistical procedures) on the other hand. Many applications of test adaptations pay considerably more attention to one aspect than to the other. However, there is a new generation of test adaptations emerging in which an extensive conceptual analysis of the target construct and cultures is combined with adequate statistical procedures. Examples can be found in large-scale survey projects where a multicultural and multilingual team prepares a source version that can be translated in all target languages. Examples are large-scale international research projects such as the International Social Survey Programme and the European Social Survey. Other examples come from indigenous studies where results are linked to the international literature so as to establish shared and unique aspects of the target instrument. A final example comes from assessment on a global market. All these applications share the issue of assessing in a context where the notion of a fixed reference group, the basis of bias and equivalence techniques, is no longer useful. Issues arising in this emerging framework for psychological assessment are described.
Abstracts of the 27th International Congress of Applied Psychology

Invited Keynotes
The shared principles that reflect the professional morality of psychologists

ALLAN, A. (Edith Cowan University)

Beauchamp and Childress (2009) submit that most learned professions have, at least implicitly, a professional morality that reflects a view shared by the majority, but not necessarily all, of the members of the relevant profession. The aim of the study of which the results are reported here, was to determine what the shared morality of psychologists is. To do this I undertook a content analysis of seminal publications on ethics by psychologists and nine codes of ethics of psychological professional and regulatory bodies. The review of the literature identified ten possible shared principles, but these were reduced to eight principles after the review of the codes, namely: Respect; Autonomy; Non-maleficence; Beneficence; Justice; Veracity; Fidelity and Responsibility. These eight principles could arguably be collapsed into a smaller number of overarching principles and the nomenclature used by different authors and drafters of codes differ, but it appears that psychologists accept this set of eight shared principles. I will briefly examine each of these principles, discuss the resolution of conflicts between them, and possible future developments.

Talking race and prejudice 'down under'

AUGOUSTINOS, M. (University of Adelaide)

Despite claims that we are moving towards a 'post-racial' world, race and prejudice continue to be intractable problems both nationally and internationally. Psychology and more specifically, social psychology, has concerned itself with this social issue at least since the 1940s, developing a wide range of theoretical approaches and applied real world interventions to help ameliorate this social scourge. This keynote address reflects on a relatively new theoretical framework for understanding prejudice and racism – discursive psychology - and the potential for developing anti-racist interventions on a larger scale based on this tradition of research. More specifically this paper will examine a body of research which has mapped debates over ‘race’ in Australia since 1995 just prior to the emergence of One Nation. This has included examining both everyday talk and political rhetoric on issues such as racism, Native Title, Reconciliation, apologising to the Stolen Generations and Australia’s treatment of asylum seekers. It identifies a recurring set of discursive resources and rhetorical commonplaces that are typically used in both informal and political discourse to justify and legitimate inequalities and the oppression of marginalised groups in ways that disavow a racist or prejudice identity. Like studies conducted in other western democracies, these discursive resources are premised on the classic liberal tropes of freedom, individual rights, equality, and rationality. The implications of this ‘liberal-practical’ discourse for anti-racist work is examined. How we as psychologists can contribute in practical ways to combat everyday prejudice and racism is also discussed.

Psychological treatment of co-existing affective and anxiety disorders and alcohol use problems

BAKER, A. (University of Newcastle)

Affective and anxiety disorders and alcohol use problems often co-exist, presenting challenging treatment issues for drug and alcohol and mental health clinicians. This presentation reports on the results of a systematic review of randomised controlled trials of psychological treatments for these co-existing conditions. In doing so, it describes in detail two recent randomised controlled trials evaluating CBT for co-existing depression and alcohol problems: the SHADE (Self-Help for Alcohol/other drug use and Depression) and the DAISI (Depression and Alcohol Integrated versus Single-focussed Interventions) projects. These studies represent the first large randomised controlled trials of CBT for co-existing depression and alcohol use problems. The SHADE project compared 10 sessions of therapist delivered and computer delivered CBT with 10 sessions of person-centred therapy. The DAISI project compared integrated (depression and alcohol) with single focussed (depression versus alcohol) interventions and a brief intervention. This presentation describes the posttreatment and follow-up results of both trials, focusing on
depression and alcohol outcomes. Based on these trials and a systematic review of the literature, recommendations for the assessment, monitoring and treatment of co-existing affective and anxiety disorders and alcohol use problems are made.

**Family psychology and therapy: Advances in treatment of couples and families**

BRAY, J. (Baylor College of Medicine)

Scientific study has advanced our understanding of couples and families and this research has facilitated the development of evidenced-based interventions. This paper will review recent advances in couple and family process research. Application of these findings to evidence-based practice will be discussed. In addition, this talk will review the status of current evidence-based couple and family therapies and discuss future areas for research in couple and family psychology and therapy. The learning objectives include: (1) Understanding current family process research and its application to couple and family therapy; and (2) Understanding current evidence-based couple and family therapies.

**The biology of posttraumatic stress disorder: Implications for therapy**

BRYANT, R. (University of New South Wales)

Recent biological models of posttraumatic stress have pointed to the importance of acute reactions in the genesis and maintenance of Post Traumatic Stress Disorder (PTSD). This presentation will review prevailing biological models of trauma response, with specific focus on fear conditioning models. There will be a review of empirical studies of biological markers of adaptive and maladaptive responses to trauma. These studies will include studies of heart rate, neuroimaging, and startle response. The review will then extend biological models to discuss factors that may predispose people to PTSD development and will review the relevant evidence. The review will address evidence concerning the role that neuroimaging evidence has in understanding the treatment of PTSD. Possibilities of enhancing current psychotherapy approaches to PTSD by modulating neurotransmitters associated with learning will be discussed and findings from a range of anxiety disorders will be discussed.

**Work and family: Can women leaders have both?**

CHEUNG, F.M. (The Chinese University of Hong Kong)

Traditional gender stereotype prescribes women to choose either a successful career or a happy family. In their career advancement, women often face this additional barrier embedded in their gender role. Previous research on work-family balance is premised on this traditional stereotype. As more women with family responsibilities rise to the top of their careers, this dualistic choice need to be re-examined. Recent research on work-family interface has advanced models that include work-family enhancement, and the integration of work and family spheres. Studies of top women leaders have enriched the psychological literature on leadership and work-family interface, and reveal strategies that are useful in managing role boundaries and integrating competing demands in different but interdependent life domains. In my address, I will highlight our study of top women leaders in the U.S., China and Hong Kong who have family responsibilities and propose an alternative model of leadership development that includes the family sphere. The convergences and divergences in the experiences these women leaders from different sociocultural backgrounds illustrate the “culture of gender”, and enrich our understanding of the interplay of personal attributes, processes, and environment in a complex model of leadership that includes work and family among women in diverse global contexts. What we have learned from these recent psychological studies can help both women and men lead a dually successful life.

**Love, eye contact and the developmental origins of empathy versus psychopathy**

DADDS, M.R. (University of New South Wales)
What processes lie at the origins of our most positive and deplorable human traits: empathy and psychopathy? This talk will present research into clinical practice with young children with extremes of aggression and antisocial behaviour. We will cover findings from the neurosciences into the origins of empathy, especially emotion processing and how it interacts with parenting, to determine pathways into the development of empathy versus psychoapthy. Recent findings on eye contact between children and their caregivers, and how this may lie at the heart of emotional health will be reviewed. The discussion will finally focus on parenting for emotional health and how these findings might inform the practice of clinical child psychology.

Couple relationships: From evolution to culture, from theory through research and to interventions

DIAZ-LOVING, R. (National Autonomous University of Mexico)

A profound interest in the expectations, perceptions, constructions, behaviors and reactions to the general functioning of couples has long occupied thinkers and scientists. Stemming from their inquiries, scientists have been able to create a complex, and on occasions even coherent, depiction of intimate relations (e.g. Fromm, 1955; Harlow & Harlow, 1965; Levinger, 1965; Bowlby, 1969; Rubin, 1973; Berscheid & Walster, 1978; Sternberg, 1986; Aron, Aron & Smollan, 1992; Duck, 1997, Perlman, 2000, Diaz Loving, 2008). However, in order to make sense of the growing amount of research findings, an integrative approach which includes biological, cultural, social, historical, psychological, ecosystem and behavioral variables must be considered (Diaz Loving & Sanchez-Aragon, 2002). Once the bio-psycho-socio-cultural model and general theoretical support for each component is presented, the increased incidence of lack of fulfillment, divorce and violence has impacted on the need of creating widespread interventions to improve couple relationships. Added to the equation are recent migratory and acculturation processes that impact on traditional norms, values and behavioral patterns, making the fit of programs based on research with samples of white middle class couples ineffective for other populations. Specifically, we will refer to the needs of 50 million Latinos living in the United States, by presenting modules which include culture, gender and communications issues to be considered in working with these groups.

An overview of Australian Aboriginal and Torres Strait Islander people and psychology

DUDGEON, P. (University of Western Australia)

This presentation will provide an overview of the history of Aboriginal and Torres Strait Islander peoples of Australia and contemporary issues related to mental health. This highlights Aboriginal peoples' resilience and struggle to claim equality and cultural recognition by providing a brief overview of pre-contact times, colonisation, resistance and adaptation to shifting government policies. The history of the discipline and practice of psychology with Australian Aboriginal and Torres Strait Islander people in relation to mental health will also be included. Psychology's key points of engagement with Aboriginal and Torres Strait Islander people will be examined and while it is acknowledged that the profession of psychology has been part of the colonising process through cultural and institutionalised racism, there is reason for optimism in current times. The potential for empowerment and inclusion of Aboriginal and Torres Strait Islander peoples at all levels of mental health service provision is at hand. This brief overview concludes with some important milestones in psychology and Aboriginal and Torres Strait Islander mental health, pointing to positive ways that psychologists can work together to bring about improved social, emotional and spiritual wellbeing for Indigenous Australians.

The many applications of Positive Psychology

FOWLER, R. (University of California)

This address will present the areas of application and modes of training that have developed in the field of Positive Psychology. Positive Psychology, launched in 1988 by Martin
Seligman, has built a strong research foundation on which to base applications. At this time there are several programs in the United States and other countries that offer a masters degree in applied positive psychology and one, in California, that offers a PhD. Currently, the principal area of application are: Positive Mental Health; Positive Education; Positive Organizations; Positive Mental Health; Positive Health and Positive Neuroscience, as well as a program to develop resilience in military personnel. Examples of activities in each of the areas of application will be presented to demonstrate that Positive Psychology is now being applied in many areas of psychology.

**Perfectionism**

FROST, R. (Smith College)

Theories of perfectionism and its role in psychopathology have flourished for over 100 years. During the last 20 years this theorizing has been supported by empirical research on the nature of perfectionism and its relationship to psychopathology. Perfectionism has been implicated as an important feature of numerous anxiety disorders, depression, eating disorders, and more. It has been found to be associated with increased co-morbidity and even mortality. Modern conceptualizations of perfectionism emphasize the distinction between maladaptive evaluative concerns and high personal standards. This keynote will review evidence related to these dimensions of perfectionism and their relationship to psychopathology. Special emphasis will be given to recent research on the mechanisms that may be responsible for the relationship.

**Psychology practice: Design for tomorrow**

GOODHEART, C. (American Psychological Association)

This presentation gives an overview of how psychology practice is evolving in the United States and the elements that we expect to produce the greatest impact on healthcare service delivery and quality of care. Important drivers of change for practice include economics, changing demographics, and advances in science and technology. Within that large context, everyday practice is being affected by ongoing national and international efforts which will be discussed. These include evidence-based practice definitions and resources, outcomes measurement frameworks, treatment guidelines, integrated health care, and the revision of the World Health Organization ICD-10 section on Mental and Behavioral Disorders with a focus on improved clinical utility.

**A love for life: Helping couples realise their relationship aspirations**

HALFORD, K. (University of Queensland)

Most adults aspire to sustain a stable mutually satisfying relationship with a spouse, and when that aspiration is realized the spouses and their children live healthier, more rewarding lives than in the absence of such a relationship. However, a range of social, personal and couple factors make the realization of relationship aspirations difficult for many couples to achieve. In this address I review the most important influences on couple relationship satisfaction and stability, and evaluate evidence on the effects of psychological interventions that aim to enhance couple relationship satisfaction and stability. There is clear evidence that we can identify couples at risk for deteriorating couple relationships, and brief psycho-educational programs can assist these high risk couples to sustain mutually satisfying relationship. The application of informational technologies holds the promise of making such programs easy to access.

**Leadership: Lessons from organisational psychology**

HESKETH, B. (University of Western Sydney)

First the presentation will highlight current and potential contributions from the field of organisational psychology to the development of leadership as an area of research and practice. This will include a brief historical perspective, but with the major focus on contemporary theory and research into leadership. Second, the presentation will focus on ways in which...
leadership research and practice can be taken forward by drawing on a broader range of concepts and approaches from the field of organizational psychology and associated areas such as applied cognitive psychology and social psychology. Examples will include the role of skill development and domain expertise, pro-activity, emotional and physical resilience, social support, personality and adaptive performance. Finally, an adaptive P-E Fit approach to leadership will be outlined, and illustrated with examples from leadership and management challenges in higher education, health and industry generally. A leadership lifecycle framework will be proposed to provide a structure that can highlight the manner in which generic leadership capabilities, domain specific knowledge and skill, and situational requirements interact to affect leadership behaviour. Ideas for future research incorporating a longitudinal focus will be outlined.

The impact of culture for counselling

KELLER, H. (University of Osnabrueck)

Transition to parenthood has become a growing concern from a public health perspective in many Western societies. The low fertility rates lead to the fact that the first contact with a baby is with the first - and often last - child. Parenthood comes at a relatively late age in a life that has been settled without children. Accordingly insecurities are high and adaptational problems between parents and child increase. As a consequence of the needs of young families, many programs have been introduced that accompany the transition to parenthood and the adaptation between parents and children. However, the problems that young families face in Western societies during the transition to parenthood, may have be different depending on the economic and social support available, the level of formal schooling, and other variables. Most programs, however, are informed by the conception of the self as an autonomous agent, which is most representative of well situated, highly formally educated middle class families. In this presentation I will argue that different cultural models of men have to be taken into account in order to meet the needs of many families. An ecocultural model of development will be presented with consequences for a cultural sensitive counseling process.

Psychology: Portrait of a discipline and a profession

KNOWLES, M. (Monash University)

This paper is written for two audiences. One includes those whose work is highly specialised and who are interested in a synopsis of the field of psychology as a whole. The other includes those on the threshold of their careers who are yet to decide in which direction the future will take them. For these purposes the paper examines the nature and origins of psychological thought, the formation of its scholarly and scientific traditions, the rise of applied psychology to deal with opportunities and demands generated by societal and national development, and the establishment of psychology as a profession. In other words, in contrast to the frequently discussed differences between pure and applied psychology this paper examines the three-way distinction which can be made between experimental, applied and professional psychology and discusses the distinguishing characteristics of each. It then considers several of the major challenges facing contemporary psychology. For example, one is the way the three different orientations just described have led to a fragmentation of psychology and what countervailing measures have been taken to foster the cohesion and integration of psychology. Another is the lack of awareness among the general public, business and community leaders, and politicians of the many achievements of psychology, and in light of this absence of knowledge and understanding what psychologists need to do to make the value of the full discipline of psychology more clear to the public in general and government officials in particular, especially as a basis for policy-making.

Evaluation of a cognitive behavioral group therapy for sexually abused girls

KOLLER, S. (UFRGS)

The aim of this presentation is to present a cognitive behavioral group therapy model among female children and adolescents victims
of sexual abuse. To evaluate the impact of this intervention by measuring over time the effects for those who participated in groups right after the event of sexual abuse and those who were on the waiting list for more than six months. A non-randomized study with intragroup comparisons over time was carried out. Psychological instruments were applied to investigate symptoms of anxiety, depression, post-traumatic stress disorder, beliefs and perception of the abuse experience before, during and after the intervention. Two follow-ups were performed after 6 and 12 months. Female children and teenagers from 9 to 16 years of age (N=49; Mean age==11.43; SD= 1.81) were clinically assessed in individual sessions. The cases were sent to the group by official institutions. The cognitive behavioral group therapy comprised 16 semi-structured sessions. The results were analyzed through statistical tests for repeated measures. The results of the pretest between the groups that received group psychotherapy immediately after the sexual abuse was reported and those who were waiting for psychological support showed that they do present differences on the reduction of the symptom. The assessment of the impact of the intervention revealed that cognitive behavioral group therapy significantly reduced symptoms of depression, anxiety, stress and post-traumatic stress disorder for all participants. In addition, the intervention enabled the participants to modify beliefs of guilt, low degrees of trust and credibility, and was effective in reducing psychological symptoms and changing distorted beliefs and perception in regard to the abuse. Cognitive behavioral group therapy was effective in reducing psychological symptoms in sexually abused girls.

Solving global health problems through applied psychology: Current models and methods and how you can be involved

KURIANSKY, J. (International Association of Applied Psychology)

People around the world face serious problems affecting health like poverty, AIDS, mental health disorders, human rights violations, lack of education, and the threat of nuclear war, climate change, and natural as well as man-made disasters. This presentation covers unique models and methods that are being used by applied psychologists to tackle these major issues, as well as practical steps ICAP attendees can take to be involved in such international projects or to develop their own projects. Principles and practical steps will illustrate how to create partnerships among psychological researchers, practitioners and organizations, and multi-stakeholder projects which bring together NGOs, governments, civil society, and the private and business sectors, as well as the United Nations and its agencies. Models include examples of both “top-down” and “bottom up” approaches starting from governments or grassroots, as well as cross-cutting cooperation and multi-partite participation. The models demonstrate approaches (1) to combat poverty and lack of education through the development of a community mental health and education center in Haiti; (2) to combat AIDS through psychosocial approaches in a camp for teen girls who are AIDS orphans in Lesotho Africa, and a program in Sierra Leone for youth health that mobilizes media, school and community resources; and (3) to overcome prejudice through grassroots peace building efforts between Israelis and Palestinians, and (4) to heal cultural wounds through Global Harmony events for Japanese-American cooperation. Methods include (1) how to access humanitarian aide; (2) specific steps for advocacy; (3) making commitments as demonstrated in the Clinton Global Initiative; and (4) how to work with the media and how to mobilize social media to create awareness and participation about campaigns, such as “We Must Disarm” “Seal the Deal” about climate change and the “Charter for Compassion.” The presentation includes how to make one’s expertise known, as well as how students can get involved in international psychology and learn about what IAAP psychologists are doing around the world. Handouts will be given about the topics, and videos will be shown demonstrating various international projects.

The self in obsessive-compulsive disorders

KYRIOS, M. (Swinburne University of Technology)
Cognitive-behavioral conceptualizations of Obsessive Compulsive Disorder (OCD) have led to effective treatments. Despite this, outcomes vary and dropout/relapse rates remain high. In fact, published studies have found that only around 40% of people with OCD who present for treatment actually recover or experience clinically significant change. In response, researchers have turned to: (i) identifying and targeting factors predictive of poorer outcomes; and (ii) developing novel treatment strategies based on new theoretical approaches. Our own theoretical and empirical work has identified a range of self-construals as being associated with poorer treatment outcomes and vulnerability to OCD. In particular, self-ambivalence, self-worth contingent on a narrow range of domains (i.e., morality, achievement, control, and perfectionism), and self-perceptions about the degree of importance and threats to perceived competence in those domains have all been found to be associated with OCD symptoms. This paper summarizes findings from the experimental and questionnaire-based research conducted by our group, and describes a range of strategies focusing on self and identity aimed at augmenting traditional cognitive and behavioral interventions for OCD.

Gambling

LADouceur, R. (University Laval)

This presentation will focus on our current understanding of gambling behavior and the causes of pathological gambling. The main elements and components of an effective prevention program will be highlighted. Finally, we will discuss the issue of controlled rather than abstinence as the main treatment outcome.

Achievements of landmark government-funded psychological services in Australia

Littlefield, L. (Australian Psychological Society)

The Burden of Disease and Injury Study in Australia indicates that mental disorders constitute the leading cause of disability. Psychologists have long argued that the Australian population should have government-funded access to psychological services for assessment and treatment of mental disorders. Almost all such funded services in the community are provided by the medical profession. A breakthrough occurred in 2001 when a Federal Government initiative called ‘Better Outcomes in Mental Health Care’ was introduced. Capped funding was provided to the Divisions of General Practice for GPs to allocate to patients to ‘purchase’ psychological services, with the aim of “improving community access to quality primary mental health care”. The uptake of these services was such that demand far exceeded the supply of funding. Based on the success of this program, a new initiative, ‘Better Access to Mental Health Care’, was developed with the aim of “enabling people with diagnosed mental disorders to access assessment and psychological treatment”. This initiative utilises Medicare rebates to fund psychological services for consumers on referral from general practitioners. Medicare-funded services provided by psychologists have been in unprecedented demand, with over 2 million Australians accessing more than 7.5 million services since the introduction of the initiative in November 2006. There has been extensive APS involvement in these initiatives since the beginning...30 years of advocacy finally paid off for the benefit of Australian consumers.

Applied psychology in the international context: What more needs to be done?

Martin, P. (Monash Medical Centre)

Psychology is a growth discipline and profession throughout the world. Psychology clearly can make a contribution to the major challenges facing the world and there are signs that this will be even more the case in the future. There are
Abstracts of the 27th International Congress of Applied Psychology

indications that national psychology associations are becoming less insular and more international in their outlooks. This Address will consider five related questions: (i) Where has psychology contributed and where could it contribute more; (ii) What do different regions of the world contribute to the advancement of psychology, and what are the problems with the current situation; (iii) What organisations are contributing to international psychology and what do they do; (iv) What more could be done by international psychology organizations; and (v) How could international psychology organisations achieve more? Challenges for psychology include that it has been dominated by contributions from North America and Europe and there is a need for increasing contributions from other regions of the world. This is necessary from the perspective of making psychology a true science but also because this will assist psychology to meet global challenges. The application of psychology has tended to focus on certain areas, in particular health, but also children/education and testing/assessment; and more attention needs to be given to the big global issues. Governing bodies, both national and international, need to be persuaded to make their priorities/goals more orientated around the well being of individuals and the community. A number of international and regional psychology organisations have made important contributions since the first international psychology congress over 120 years ago. Perhaps after all these years it is time for a major review of the structure of these organisations individually and also with a view to whether there should be mergers or at least more collaboration. International psychology needs more resources if it is to achieve greater things, and this can be achieved via increasing subscriptions/dues and/or developing new income streams. Surely, with perhaps a million psychologists worldwide, it must be possible to raise a significant amount of annual revenue! International psychology needs to become more strategic and more sophisticated politically.

An eclectic approach to psychology: Realising the promise of the scientist-practitioner model

Psychologists face an expanding marketplace of procedures for the application of psychological knowledge. We are exhorted to join a 'school' or hop onto the latest bandwagon. How do we choose, in the best interests of ourselves and our clients? Our choices, as indicated by success in the marketplace, suggest we tend to think like other humans, relying on illogical heuristics and influenced as much by emotional and social pressure as objective evidence. Usually inadequate and hence competitive research-funding promotes claims of newness and difference that don't bear close scrutiny. The complexity of human psychology requires a holistic approach and an ability to link seemingly disparate ideas. This is hindered by narrow teaching and one-size-fits-all claims. Reviews of schools of practice identified eclecticism as the most popular reported choice. However, this is often syncretism, an uncritical willingness to adopt any new idea regardless of its theoretical or research base. Applied science is hard work, sometimes counter-intuitive, requiring tolerance for ambiguity. Applied psychology requires a willingness to put the needs of the client ahead of personal satisfaction. Originally eclecticism involved an openness to new practices, based on their research support, and I propose a return to that. As well as the usual criteria for acceptable research evidence, I see as essential evidence for effectiveness - the ability to deliver a procedure to many of those who would benefit from it, under the circumstances likely to prevail - based on but going beyond efficacy. We need research with ecological validity. In light of the marked excess of need for versus availability of psychological services, we should engage in responsible sharing of established psychological knowledge and procedures with our colleagues in other professions and with our consumers.

A realistic interpretation of the scientist-practitioner model recognises that most psychologists are consumers of science rather than producers. An eclectic approach requires that we teach our students to be discerning, sceptical consumers, able to benefit from advances in our science to the benefit of their clients. This is realising the promise of the scientist-practitioner model.

MONTGOMERY, B. (Australian Psychological Society)
Psychological approaches to bipolar disorder: Where to next?

MURRAY, G. (Swinburne University of Technology)

Bipolar disorder is a serious mood disorder which affects at least 1% of the population. Interest in psychological approaches to the disorder has increased exponentially over the past decade, and the aim of this talk is to provide a forward-looking update of contemporary investigations. Material will be organised around four topics: new perspectives on diagnosis and assessment, the current state of the treatment evidence base, the hunt for good psychological models and the importance of patient-centred research and practice. By proposing key questions in these domains, it is hoped the talk will inspire further psychological research and theorising, inform psychologists who work with this population, and encourage realistic optimism amongst people with bipolar disorder.

Evidence-based practice may start in the animal laboratory: Selected examples past and present

OVERMIER, J.B. (University of Minnesota)

Adolf Meyer argued for grounding psychiatry in fundamental researches on behavior. After brief review of foundational animal researches contributing to clinical practice, I will review several contemporary examples. Then, I will elaborate in some detail on one example, a relatively new instance from our laboratory called (infelicitously) the “differential outcomes effect”. Applications to normal children, mentally retarded persons, language delayed children, memory impaired seniors, and even advanced school students will be presented. Finally, I will explore some future possibilities for applications of this methodology.

Ambulatory assessment: The methodological route into the domain of real-life behaviour

PAWLIK, K. (University of Hamburg)

Since the 1970s/1980s psychology has come of age, methodologically and theoretically, to transgress limiting boundaries of the laboratory and study human behavior and experience, actions and affects, and even psychophysiology, in a person’s every-day life-course: at the workplace, at leisure, 'in the field'. To this end new instruments of assessment and study designs had to be developed, now referred to as “ambulatory assessment”. They enable a researcher to investigate a psychological problem under conditions realistically representative for the processes under study. In this address different designs, technical implementations and psychometric standards of ambulatory assessment will be introduced, with examples of methodology, selected research findings, and reference to comprehensive literature. On a theoretical note, ambulatory assessment will be shown to open up a new third “discipline”, viz. of eco-representational psychology, beyond the classical experimental and correlational (or clinical) “disciplines” distinguished by J.F. Dashiell (1939) and L.J. Cronbach (1958).

Building an evidence-based population level intervention system to promote competent parenting

RALPH, A. (University of Queensland)

Triple P-Positive Parenting Program has developed the capability of delivering large scale population-level parenting interventions building on over 30 years of applied international research. It comprises a tiered, multi-level approach incorporating media, community, primary care, school, mental health and workplace interventions to promote competent parenting and reduce coercive parenting and family conflict. The system aims to promote parental self regulation, thus improving self efficacy, self management skills, problem solving skills, and enables parents to become more self sufficient. The primary aim is to decrease the prevalence of externalising and internalising social, emotional and behaviour problems in children and adolescents by increasing the competence, knowledge and confidence of parents at a population level. Implications of the findings of selected research studies will be discussed. The paper will also discuss a series of
issues in the form of lessons learned from the practical application of the public health approach at a whole of population level, including issues associated with dissemination and training.

**Theoretically-based developments in the treatment of social phobia**

RAPEE, R. (Macquarie University)

Generalised social phobia is a chronic disorder that commonly begins in childhood or early adolescence and tends to continue across the lifespan. Social phobia has one of the lowest remission rates of any mental disorder. It produces moderate to severe impact in people’s lives, affecting family, relationships, study, career, and medical problems. It is also commonly associated with other severe disorders such as depression and substance abuse. Empirically validated treatments for social phobia have been reasonably successful. The majority of empirically validated treatments centre around exposure in-vivo, often with additional cognitive restructuring. Several meta-analyses have reported that these comprehensive packages result in pre to post-treatment changes of around 0.8-1.0 sd on measures of social anxiety. Comparatively, social phobia has shown the smallest response to treatment of any anxiety disorder (Norton & Price, 2007). These findings suggest that improved techniques need to be developed for best practice management of social phobia. Arguably, these improvements should come from advances in theory. The current talk will describe three directions that we have attempted to take to increase effect sizes for the treatment of social phobia. The first direction comes from cognitive models of the maintenance of social phobia. These models have pointed to several factors that appear to play a central role in the maintenance of this disorder including a negative mental representation, subtle avoidance and safety strategies, and an inefficient focus of attention. Based on these suggestions it is predicted that incorporating strategies to target these mechanisms should improve effects. The results of a large-scale RCT will be described showing that a package that aims to modify these mechanisms produces a larger effect size change than a traditional treatment package utilizing only exposure and cognitive restructuring. A second direction of research picks up on recent discoveries in the area of cognitive bias modification. Experimental research has shown that modifying automatic attentional biases toward threat among anxious individuals can reduce fears. We are near to completing a RCT in which attention re-training has been incorporated into our best practice treatment package and the results of this trial will be reported. Finally, a new direction of research has shown that enhancement of the effects of exposure can be produced chemically by ingesting medications that directly target the biochemical mechanisms of learning. Incorporation of these methods into treatment may provide an enhanced exposure effect and may signal a new paradigm in the management of anxiety disorders.

**If you thought that was hard, try changing health care provider’s clinical behaviour!**

SANSON-FISHER, R. (University of Newcastle)

Psychology has much to offer in explaining and changing behaviour. Over the last few decades it has made an impressive and valuable contribution to assisting a wide variety of in need patient and other groups improve their well-being. While debate continues about the most acceptable and efficient way of assisting patient and community change our profession is only gradually coming to an acceptance that it has an important role to play in changing health care provider’s behaviour. There is now substantive research indicating that there is an important and concerning level of evidence practice gap in many areas of clinical health care delivery. If this gap could be reduced there would be significant gains for a wide range of patient groups and possibly significant health cost savings. Psychology is well-positioned to make a positive contribution to this important endeavour. It has expertise in considering and evaluating methods of measuring clinical performance, understanding the reasons for the current failure to adopt best evidence medical practice, and in developing, implementing and evaluating strategies designed to reduce the disturbing evidence practice gap. This
presentation will focus on the ways in which psychologists could apply their skills in this field and in so doing, improving the well-being of many.

**Redefining trauma and the treatment of disturbing life experiences**

**SHAPIRO, F. (EMDR Institute)**

Research and clinical experience over the past twenty years have led to a reconceptualization of the term “trauma” to encompass far more than the “Criterion A” events traditionally used to diagnose PTSD. For instance, a large general population survey has reported that disturbing “life events” resulted in more PTSD symptoms than did major trauma. Further, research has indicated that while only a minority of trauma victims develops full-blown PTSD symptoms, the negative effects of these disturbing life experiences have important cognitive, affective, and somatic implications for intra- and interpersonal functioning throughout the lifespan, and appear to underlie a wide range of clinical complaints. These conditions can be independent of major traumatization, and stem directly from the disturbing life experiences that can define the person’s sense of identity, negative beliefs, emotions, and behavior. The focused application of procedures to the memories of these experiences can result in a rapid remediation of symptoms, even in the case of previously intractable conditions such as chronic pain, deviant arousal, and insecure attachment. An integrated approach to both case conceptualization and evidence-based practice will be described that applies to both individual and social dysfunction. Research, including neurobiological findings and clinical reports, will be used to illustrate the effects of efficient treatment, including the ability to simultaneously alleviate personal suffering, help stop the cycle of violent or predatory behavior, and prevent the trans-generational transmission of pathology. The clinical implications for simple symptom reduction versus personal growth and resiliency will also be explored, and recommendations for future research proposed. A short treatment tape of a research participant with 1-year follow-up will demonstrate the interrelationship of memory, symptom patterns, and pronounced clinical effects.

**Coping with demands of social change across the lifespan**

**SILBEREISEN, R. (University of Jena)**

We live in times of rapid social and economic change, and many individuals experience challenging demands related to changes in the work place, in their family, and in public life. Examples in Germany refer to the need of great flexibility when searching for a job, of delaying commitments in partnerships, and of adjusting into a multicultural environment. Utilizing large samples of adults (16-43 years) from various parts of the country, we assessed the cumulated load of demands individuals have experienced over the last five years. Applying a complex model of action regulation vis-à-vis such challenges, individuals’ ways of dealing with the demands were investigated as well as the personal and social resources at their disposal. We found that people with lower levels of education or occupational status and those from the East of the country experienced higher loads of change-related demands, particularly in the domain of work. Higher loads, in turn, corresponded to lower well-being and satisfaction with intimate partnerships and life in general, particularly if individuals were not able to actively deal with the demands. This general picture was qualified by influences from conditions of the economic and social context. People who lived in economically challenged areas of the country showed weaker associations between demand load and well-being, probably due to the fact that the common fate inoculated them from attributing the demands as personal failure. The model of action regulation was further used to replicate the results with a cohort of older adults (55-75 years), and to launch a cross-national comparison with Poland. Taken together the results demonstrate the multiple levels through which social change affects individuals. This is the basis for new research questions of importance for other countries and regions as well.

**Are we close to being able to prevent depression and anxiety in young people?**

**SPENCE, S. (Griffith University)**
Depression and anxiety are relatively prevalent mental health problems among children and adolescents. Although effective treatments are available, prevention of these disorders would save a good deal of suffering and cost in the longer term. This paper will discuss the status of current research relating to the prevention of anxiety and depression in young people. In particular, it will highlight the lessons that we have learned and the challenges we face in the development and implementation of preventive interventions with young people and their families. To date, most preventive interventions for young people have been implemented within school contexts. The paper will use research over the past decade conducted by the presenter and colleagues to illustrate current approaches to the prevention of depression and anxiety among children and adolescents. The results from a series of studies relating to the Problem Solving for Life Program and the beyondblue Schools project will be described. The relative benefits of universal versus targeted preventive approaches will be discussed, along with the need to develop ways to ensure fidelity of implementation of interventions in real world contexts. The paper will explore future directions for prevention research in this area and implications for mental health practitioners.

Applying CBT methods to OC spectrum disorders: The special case of hoarding

STEKETEE, G. (Boston University)

Compulsive hoarding is a relatively new topic of study in mental health and human services and currently has the singular disadvantage of being a behavioral and mental health problem without clear diagnostic criteria, although this seems very likely to change with the DSM V. Studying this problem has been difficult and sometimes backward, a not uncommon problem in research, as our theoretical models that inform interventions are inadequately tested while those in dire need of help cannot wait. Hoarding, in particular, challenges researchers on multiple fronts as so many disciplines and human service agencies are engaged in copying with and trying to resolve its myriad and sometimes crippling effects. With a somewhat complex CBT model undergirding treatment methods, clinicians must learn to utilize motivational interviewing, cognitive skills training, cognitive therapy, behavioral practice methods for organizing, sorting removing clutter and not acquiring. This intervention package can be delivered in several modalities that include individual and group treatment, as well as online and web camera methods, with and without the aid of readings and in-home coaches. This lecture will examine the process and outcomes of these service delivery methods.

Constructing psychological science: Application and theory hand-in-hand

TRZESNIAK, P. (Escola Federal de Engenharia de Itajubá)

Science primarily focuses on survival and well-being of humanity. The very beginning of knowledge is how to do things in a more simple and/or better way. Even the formal and abstract mathematics had its days of practical, applied knowledge – like “selling two cows three times is equivalent to sell three cows two times”, or that “a right angle is built with three ropes with lengths three, four and five”. Today (2010), various emerging Sciences – accounting, nursing, psychology, management – present a strong applied (professional) dimension, but their scientific counterpart is still in some – more or less - initial stage. We ask: can we accelerate emerging Sciences by looking at the more mature ones (physics, chemistry, and even mathematics)? We answer with yes - but not by just blindly transferring some quantitative methods. One has to look at the development (epistemology), and that is what the Japanese physicist Taketani (1911-2000) did for us. Taketani claimed that well-succeeded applied experiences are the key factor for constructing Science and that “non-immaculate” knowledge is a necessary step that must be accepted in the context. He proposed an “applied Philosophy” useful to develop new knowledge (instead of trying to prove that something is bad Science because it fails to explains one very particular situation). We will explain Taketani’s model and present an example from Psychology where its application improves the quantity of relevant scientific results compared to the efforts to achieve them.
Also inspired by Taketani’s proposal, we will speculate on the future, suggesting three subjects to be in the mainstream of Psychological research in 2040.

The application of psychology to the prevention and treatment of eating disorders

WADE, T. (Flinders University)

Eating disorders are serious mental illnesses that carry a substantial harmful burden on both psychological and physical health. All-cause mortality rates are significantly elevated compared to non-affected individuals: Anorexia Nervosa (AN) is associated with the highest mortality rates of any psychiatric disorder and suicide standardized mortality rates are significantly elevated for Bulimia Nervosa (BN) and Eating Disorder Not Otherwise Specified (EDNOS), representing one of the highest rates across all psychiatric disorders. Eating disorders are also associated with the highest proportion of admissions of all psychiatric disorders, the longest median length of stay, and higher health care utilization than individuals with all other forms of mental illness. Additionally, Australian research shows that: (a) Individuals with eating disorders have significantly impaired social, vocational and educational functioning, as well as reduced productivity due to lengthy absences from work and school, and days out of role are significantly more frequent for people with eating disorders (19.8%) compared to those without (9.5%), (b) Between 15-24 years of age, BN and AN are the 8th and 10th leading causes of burden of disease respectively, (c) In South Australia from 1995-2005 there were over 2-fold increases in eating disorder behaviours. Overall, it is of critical importance to focus research on both the prevention and treatment of eating disorders. This talk will examine the state of research relating to these two endeavours, and will focus particularly on Australian research that has shown good potential in prevention and treatment.

Micro-macro dynamics of the cultural construction of reality: An institutional approach to culture

YAMAGISHI, T. (Hokkaido University)

Humans think, communicate, and behave to adapt to a particular social ecology, and by doing so they collectively create, maintain, and change the ecology (i.e., social niche) they adapt to. The institutional approach to culture analyzes culture as an institution, which is a self-sustaining system of shared beliefs. A set of shared beliefs make it possible for people who understand that the beliefs are shared by others to adjust their behavior to the anticipated responses from others. People who share the same set of beliefs thus induce each other to think and behave in particular ways by behaving in particular ways themselves. The best support to this approach is found when cultural differences in cognition and behavior that are regularly observed in everyday life disappears in a social vacuum – in a situation in which people are rid of any social concerns about implications of their behavior and can express their thoughts and behave free of any social concerns. Examples of such experimental manipulations will be presented and discussed.

Applied psychology as the functional contextualist views it

ZETTLE, R. (Wichita State University)

Several paradigmatic and philosophical perspectives are available to serve as a foundational base for applied psychology. Among these, functional contextualism seems most useful in adequately meeting the challenge of the human condition with sufficient scope, depth, and precision. The basic tenets, truth criterion, and root metaphor of functional contextualism will first be defined and contrasted with those of mechanism, which at least implicitly appears to be the dominant paradigmatic perspective within most of applied psychology. This will be followed by an overview of Relational Frame Theory (RFT) as a functional contextualistic account of language and cognition. Finally, research on the application of RFT through Acceptance and Commitment Therapy (ACT) and in work with developmentally delayed populations will be presented and discussed.
Workshops
Mindfulness training interventions in adolescents

ALLEN, N. (ORYGEN Research Centre), KNIGHT, W. (ORYGEN Research Centre)

Abstract not available at the time of printing

Preventative CBT based interventions

BARRETT, P. (University of Queensland), OJALA, K. (Pathways health and Research Centre)

Family-based clinical early interventions for children to promote resilience and well being and to prevent the onset of behavioural and emotional disorders are the future of both psychology and psychiatry. We now have evidence-based and proven-effective techniques that we can teach children, their parents, their siblings and their teachers to be happy and healthy and to stay that way throughout their development for very little cost. The FRIENDS for Life programs have been supported by the World Health Organization and cited in the Cochrane Library. The programs are currently used in 18 countries for the prevention of anxiety and depression in children, and for the promotion of social-emotional and positive coping skills across the lifespan. Whether your child is aged 4, 8 or 16, or is in fact an adult, we have programs that teach Cognitive Behavioural Therapy techniques to cope with stressful life situations and promote lifelong resilience that really work.

Suicide prevention in the elderly

BHAR, S. (Swinburne University of Technology)

This workshop describes cognitive behaviour therapy (CBT) for suicide prevention in older adults. The following aspects of the treatment are described: Assessing suicide risk, conceptualizing the problem through a cognitive behavioural framework, developing a safety plan, increasing hope and reasons for living, improving social resources, improving problem solving skills and efficacy, improving adherence to medical regimens, and relapse prevention. In addition, we review other behavioural and cognitive strategies such as activity scheduling and cognitive restructuring that are commonly associated with CBT interventions for depression. The application of these strategies for older adults is illustrated with case examples.

Facilitation processes for peace psychologists

BREThERTON, D. (University of Queensland)

This workshop will provide opportunities for participants to share their own concepts of conflict and peace and to consider how these might shape their practice as psychologists. There will be a short presentation on “What in the world is peace psychology?” followed by interviews with practitioners of peace psychology from different parts of the world. Finally the workshop will reflect on how peace can be incorporated into the theory and practice of various branches of psychology and how psychologists can contribute to peace building at home and abroad.

Treating and preventing posttraumatic stress disorder

BRYANT, R. (University of New South Wales)

Acute stress disorder (ASD) describes initial stress reactions that are predictive of chronic posttraumatic stress disorder (PTSD). This workshop outlines assessment and treatment of ASD/PTSD. It commence with an outline of the fundamental theories underpinning ASD/PTSD. The workshop will then proceed to a recent update of empirical developments, with an emphasis on ASD. This review will include recent studies of behavioural, cognitive, and biological responses of trauma response. The workshop will provide a review of current assessment tools, as well as interactive discussion of strategies for assessing acutely traumatised individuals. A review of treatment studies will be conducted. Detailed outline of cognitive behaviour therapy strategies will be proved. Obstacles to treatment will be discussed in the context of case studies.
Beginner's guide to structural equation modeling: Basic concepts and applications

BYRNE, B.M. (University of Ottawa)

This workshop presents a nonmathematical introduction to the underlying rationale and basic concepts associated with structural equation modeling (SEM). It is developed around the presentation of generically-labelled models void of notation specific to particular SEM computer programs. Participants are shown how to: (a) decompose basic models into linear structural equations that serve in specifying hypothesized models, (b) evaluate the extent to which hypothesized models "fit" the data, and (c) determine the need for, and assess, findings from post hoc model-fitting. Although designed for researchers having no knowledge of SEM, a basic knowledge of multiple regression is recommended and some knowledge of factor analysis may be helpful.

Testing for measurement equivalence across groups: Basic concepts and applications

BYRNE, B.M. (University of Ottawa)

A critical prerequisite to multigroup comparisons is knowledge that assessment measures are operating equivalently (i.e., they are invariant) across groups. This structural equation modeling (SEM) workshop demonstrates procedures involved in testing for the equivalence of assessment scales across: (a) calibration/validation samples, and (b) independent samples. Examples include first-order and second-order factor models applied to both mono-cultural and multi-cultural groups. Workshop participants are "walked through" the analytic process from model specification in the computer input file to interpretation of results in the computer output file. To gain the most from this workshop, some knowledge of, and experience with SEM is recommended.

Beyond manuals: How to do child and family therapy really well

DADDS, M.R. (University of New South Wales)

This workshop will cover skills for working with parents of young conduct problem children. Engaging such parents can be challenge, and getting positive change, even more so. Attendees will be introduced to methods for joining with parents, identifying and overcoming obstacles to change, and maximising outcomes in parent training programmes.

Positive health and positive aging: Health and well-being throughout the lifespan

FOWLER, R. (American Psychological Association), FOWLER, S. (Uniformed Services University of the Health Sciences)

Health—physical and mental—is more than the absence of illness. Research in positive psychology and positive health has identified factors that help people live longer, healthier, happier and more successful lives. Aging continues throughout the lifespan. Lifestyle changes that facilitate healthy aging will be presented along with case histories, exercises and opportunities for self-evaluation and discussion.

Entrepreneurship

FRESE, M. (University of Giessen)

In this workshop I walk through how psychological studies can be performed in the area of entrepreneurship. I start with a definition of entrepreneurship (around opportunity detection and exploitation) and describe how psychology can contribute to this area of study. Which psychological approaches help here, e.g., cognitive or emotional approaches, social psychology of groups, action and performance theory. Moreover, a number of important methodological issues for entrepreneurship research will be discussed. As I am field editor for psychology for Journal of Business Venturing – the most important entrepreneurship journal – I shall also discuss which problems appear when publishing in such a journal and how one can develop studies that will have an impact in this area.
Psychological treatment of compulsive hoarding

FROST, R. (Smith College)

Professor Frost has been at the forefront of developments in our understanding of compulsive hoarding and its contemporary psychological treatment. The symptoms of compulsive hoarding in adults include acquiring too many things, difficulty discarding, and excessive clutter that interferes with normal use of space and/or causes distress. Difficulty making decisions, emotional attachment to possessions, and strong negative emotions on parting with objects are hallmarks of this condition. A model for understanding hoarding behaviors, emotional attachments and beliefs about possessions will be presented along with intervention strategies. Tools for clinical assessment of the features and severity of hoarding and associated mood will also be presented. Intervention strategies to be presented include motivational enhancement, establishing goals for treatment, increasing organizing and problem solving skills, restructuring problematic beliefs about possessions, and exposure to removing possessions and reducing avoidance behaviors. Outcome research using this approach will be reviewed as well as limitations of such interventions and the utility of other strategies (e.g., self-help).

Item response theory: Concepts, models and applications

HAMBLETON, R. (University of Massachusetts)

Many testing agencies would like to use item response theory (IRT) models for developing, scoring, identifying bias, and equating of their aptitude, achievement, and personality tests. These IRT models, too, can be used to provide the measurement underpinnings for new test designs such as multi-stage testing and computer-adaptive testing. In this intensive one-day workshop, we will address many topics: (1) Shortcomings of classical test theory that have inspired the development of IRT models; (2) specific IRT models for fitting binary and polytomously-scored data (e.g., 1-, 2-, and 3-parameter logistic models, graded response model, generalized partial credit model); (3) basics of item and ability parameter estimation; (4) graphical and statistical approaches for assessing model fit; (5) introduction to IRT software (e.g., BILOG-MG, PARSCALE, and WINGEN); (6) development of tests using item and test information, and automated test assembly; (7) identification of potentially biased test items (e.g., comparing item characteristic curves); (8) equating of test scores (designs, methods, and implementation); (9) reporting scores using item mapping; and (10) new test designs such as multi-stage and computer-adaptive designs.

If there is interest in participants gaining some practical experiences during the workshop, we could demonstrate several of the software packages including BILOG and PARSCALE, and highlight the use of WINGEN for conducting simulation research. I will provide reprints of several articles, and a brief bibliography for follow-up readings.

Evidence-based psychotherapy with LGBT clients

ISRAEL, T. (University of California)

This workshop will equip attendees with knowledge and skills to enhance psychotherapy practice with lesbian, gay, bisexual, and transgender (LGBT) clients. The presenter will provide attendees with an overview of current research that informs psychotherapy with LGBT clients. Attendees will learn about recent findings regarding sexual orientation identity development, conversion therapy, LGBT people of color, helpful and unhelpful psychotherapy practices, and therapist competencies for working with LGBT clients. This interactive workshop will include lecture, discussion, and role plays. By the end of this workshop, participants will be able to: (1) identify current research that informs psychotherapy practice with LGBT clients; (2) describe helpful and unhelpful psychotherapy practices with LGBT clients; (3) recognize the unique knowledge and skills necessary to work with transgender clients; and (4) demonstrate affirming responses to clients who are experiencing conflict between
their sexual orientation and their culture, religion, or other social identities and communities.

**Adapting psychological interventions for older adult clients**

**KNIGHT, B. (University of Southern California)**

Using Knight’s Contextual Adult Life Span Theory for Adapting Psychotherapy (CALTAP), the workshop will present a framework for thinking about adaptations in psychotherapies with older adults that involves a greater focus on changes due to cohort effects, cultural differences, social context, and the specific challenges of later life than on developmental aging per se. The workshop will include presentations of clinical materials and time to discuss cases brought by the audience.

**Effectiveness of workplace training**

**KRAIGER, K. (Colorado State University)**

Abstract not available at the time of printing

**How to get your book published: From idea to amazon**

**KURIANSKY, J. (Columbia University Teachers College)**

ICAP attendees have valuable ideas and work that needs to be shared with colleagues and with the public. This "how to" workshop covers the important steps to take to get your book published in the field of applied psychology. It is given by a "media psychologist" who has a great deal of experience in this field, as a psychologist and an author who has published over a dozen non-fiction books in English in America over a span of twenty five years, as well as original books in Chinese and Japanese. The object of the presentation is for professionals from different countries to get their work known. The presentation gives very practical information and easy-to-follow steps about how to go from your idea to a formal proposal; where and how to submit your proposal; how to work with agents, editors and publishers; what to look for in contracts; the pros and cons of self-publishing versus signing with a publishing house; and what you can and can't expect in the contemporary complicated publishing world. Other topics covered include publishing in both mass market and academic publishing houses, in hard back and paperback formats, in different topics related to psychology, in several editions. Tips will also be given on how to market your book, since getting the word out once your book is published is essential. Participants are encouraged to bring their ideas and projects, and specific attention and advice will be given to these individual projects.

**Psychological treatment of problem gambling**

**LADouceur, R. (Laval University)**

Abstract not available at the time of printing

**Motivational interviewing skills training**

**Lindner, H. (Australian Psychological Society Ltd)**

The 1-day workshop will present the principles, assessment techniques, and strategies of motivational interviewing. The training will also aim to develop participant-skills in motivational interviewing, including the assessment of a client’s readiness to change, and behaviour change techniques to reduce ambivalence and increase efficacy to change. Specific topics to be covered in the training workshop include: principles and aims of Motivational Interviewing, Motivational Interviewing communication techniques, assessment skills for patient readiness to change behaviours, interventions for increasing motivation to change, and interventions to identify SMART goals and develop action plans. Skill development of the above areas will be achieved through demonstrations by the presenter and workshop attendees undertaking small group skill development activities. Psychologists and other health professionals have a major role to ensure effective client adherence to recommended client-managed treatments for chronic illnesses, such as arthritis, heart disease, diabetes, obesity, and asthma. Additionally, psychologists can contribute significantly to client self-
management changes in health risk behaviours, such as smoking and alcohol abuse. Although there is awareness in the community of health risks behaviours, substantial non-adherence is reported for a range of interventions, including health behaviour changes associated with physical exercises, medication consumption, monitoring schedules, lifestyle behaviours, and medical and allied health appointments. The literature reveals that education and instructions on the prevention and treatment of a medical condition have a role in developing effective client self-management, but that these are not sufficient by themselves to ensure health behaviour change. Unfortunately, not all clients are ready for change. Researchers have proposed that health professionals who use Motivational Interviewing techniques can significantly enhance client self-management of chronic illness and illness prevention. There is a growing requirement from Governments around the world for medical, nursing and allied health professional training programs to include strategies, such as Motivational Interviewing, to enhance patient adherence to recommended treatments.

Psychological management of chronic headaches

MARTIN, P. (Monash Medical Centre)

It has been estimated that globally, the percentages of the adult population with an active headache disorder are 46% for headache in general, 11% for migraine, 42% for tension-type headache, and 3% for chronic daily headache. On the ranking of causes of disability of the World Health Organization, this brings headache disorders into the 10 most disabling conditions for the two genders, and into the 5 most disabling conditions for women. Over the last three decades psychologists have contributed to our understanding of headaches and developed highly effective treatments for tension-type headache and migraine. This workshop will present a functional model of chronic headaches that is designed to help understand the variance in headaches - why individuals suffer from headaches at one time rather than another, why they are getting headaches during this period of their lives rather than other periods, why the headache disorder began when it did, and why they are vulnerable to suffering from headaches? The model serves to educate patients and inform the assessment and treatment process. The management approach presented will be a form of cognitive behaviour therapy developed by the workshop presenter and validated in a recent randomised control trial. In this study, the average reduction in headaches resulting from this approach was 68% at the end of treatment and 77% at 12 month follow-up. The workshop will begin with a discussion of its aims and objectives followed by a focus on the headache experience. The peripheral and central mechanisms of primary headaches will then be discussed followed by headache classification and diagnosis, and danger signs that prompt referral to a neurologist. It will include assessment of headaches using interviews, self-monitoring, questionnaires and behavioural experiments. Treatment techniques will include education, relaxation training, imagery training, attention-diversion training, and cognitive therapy for modifying maladaptive thoughts and beliefs related to headaches. It will also include behavioural management of headache triggers, a major current focus of the presenter's research program.

Inpatient aggression and reducing coercive practices

MARTIN, T. (Monash University), GINDERS, T. (Forensicare)

Aggressive behaviour in psychiatric hospitals is common and has a significant impact on patients, staff and visitors to psychiatric hospitals. It also affects ward atmosphere and routine and care delivery in general. Coercive practices such as seclusion and restraint have been used to manage inpatients aggression. This workshop will introduce participants to a wide range of strategies that have been found to be effective in reducing the use of seclusion and restraint across the world. Several organisational approaches, including leadership, workforce development, use of data, trauma informed care and sensory modulation will be presented as important approaches that enhance therapeutic practice and reduce coercive methods. The most common precipitants to aggression towards staff will be discussed and recent research examining
the role of interpersonal style, its interaction with psychiatric symptoms, and its impact on patients' perceptions of coercion, and aggression and self-harm during psychiatric hospitalisation will be discussed. Implications, drawn from interpersonal theory and research examining patient satisfaction and compliance in alternate health settings will be drawn upon to guide staff in new ways to interact with, and deescalate patients at risk of aggression. Structured methods of risk assessment that help to identify patients at risk of imminent aggression are also required for early intervention in order to decrease reliance on coercive practices. Attendees will be introduced to one tool that is used to assess the risk of imminent aggression, the Dynamic Appraisal of Situational Aggression: Inpatient Version (DASA:IV). This workshop holds relevance for the range of disciplines in a range of inpatient/residential settings where aggression is a common experience.

**Emotional intelligence: From research to application**

MATTHEWS, G. (University of Cincinnati), ROBERTS, R. (Center for New Constructs)

The construct of emotional intelligence (EI) continues to maintain a high profile in applied psychology. It is believed that the competencies related to EI contribute to greater job success and work satisfaction, to social-emotional functioning at school, to better mental health and to more constructive interpersonal relationships. However, despite its potential, the science of EI is still at an early stage of development, and many key questions relating to both theory and practice remain unanswered. There have been particular difficulties in deriving valid measures of EI for use in applied psychology. In addition, many commercial exploitations of the concept are not based on sound psychological science. Thus, the practitioner requires a critical understanding of research on EI in order to derive applied benefits from this work. This workshop will familiarize practicing psychologists, researchers, and graduate students with current methods of assessing emotional intelligence (EI) and problems that may arise when applying these measures for research or practical purposes. The goals of this workshop are as follows: to familiarize participants with the leading research and theory in the area, to evaluate critically the leading methods for assessment of EI, and key tests and measures, to introduce new techniques for evaluation including situational judgment tests (SJTs), and to highlight issues in transitioning research into specific applications (participants may raise specific issues for discussion).

**Psychological responses to disasters: An empirically informed approach to helping the survivors of trauma effectively and safely, in the field and in the clinic**

MONTGOMERY, B. (Australian Psychological Society), MORRIS, L. (Private Practice)

Disasters, both natural and man-made, are an inevitable occurrence. Involvement in a traumatic event triggers a series of responses which can be seen as the Crisis Response and Recovery Cycle (CRRC). While recognising the variability intrinsic to psychological phenomena, the CRRC is useful for understanding reactions to trauma and guiding interventions. The Crisis Response typically involves shock, disbelief, then a growing realisation of the reality of the event, which triggers a psychologically frozen survival state. When the event ends, the Recovery phase can begin, typically involving shock again, depression, mood swings, anger, reflection on the experience, and finally laying it to rest as a bad memory that does not intrude unacceptably into life. Survivors normally progress through a range of reactions to trauma and benefit most from interventions suited to their present state and needs. Effective psychological interventions parallel the development of the CRRC. Psychological First Aid (PFA), as the term implies, is aimed at immediate alleviation of suffering, minimisation of further injury, and facilitating recovery. During and immediately after a traumatic event, PFA involves provision of basic emotional and practical support, particularly to restore a sense of safety. In the longer aftermath of a disaster, PFA involves the application of some basic counselling skills to facilitate long-term recovery. PFA may be more effectively delivered by non-psychologists, with support from psychologists. Available evidence suggests
these relatively brief interventions are sufficient to help most survivors heal themselves because most people are reasonably psychologically robust. However, there are usually 10-20% of survivors for whom this won’t be enough. For them, effective support involves provision of evidence-based interventions to alleviate or prevent serious post-traumatic stress reactions. Recent reviews of research show that, when initiated within three months of the event, these interventions can achieve those goals. This workshop will introduce participants to the research base and practice skills for helping trauma survivors safely and effectively, in the field and the clinic.

Caution: You are advised that skills practice involves simulation of working in the field. This is intentionally stressful, so intending participants, particularly survivors of past traumatic events, should consider this before registering.

**Obsessive-Compulsive Disorder (OCD): A cognitive-behavioural, attachment and self-based approach to understanding and treating OCD**

MOULDING, R. (Swinburne University of Technology), KYRIOS, M. (Swinburne University of Technology), NEDELJKOVIC, M. (Swinburne University of Technology)

This full-day workshop will cover the assessment, diagnosis, and treatment of Obsessive-Compulsive Disorder (OCD). The workshop will draw on cognitive-behavioural theory, as well as attachment and self-related concepts to develop a conceptual framework for understanding OCD, its treatment, and the requirements for engaging clients in psychological treatment and management. The workshop will cover basic and advanced cognitive-behaviour therapy, including exposure and response prevention, cognitive therapy, ACT, mindfulness, and self-based techniques. We will also discuss important issues in engaging clients with OCD. The workshop will allow for participant interaction and case discussion. Notes will be made available, and additional references and resource material will be suggested.

**Psychological models and treatment for bipolar disorder**

MURRAY, G. (Swinburne University of Technology)

Bipolar disorder is a serious disorder of mood which affects at least 1% of the population. Treatment outcomes for this complex and variable condition are not satisfactory, but psychological models and treatment approaches show great promise for improving symptoms and quality of life. Workshop participants will be introduced to theory and skills related to the assessment and psychological treatment of bipolar disorder. Recognised treatments will be described, and the challenges in applying them in everyday practice considered. We will also consider the obvious gaps in the existing therapeutic toolbox. These include recent discoveries about well-being strategies used by high functioning people with bipolar disorder, and the need to account for the marked strengths of this population. The workshop will be conducted in an interactive seminar format. Instructional videos will be used to demonstrate the symptoms of bipolar disorder. Participants will be provided with a handbook of resources and background information supporting the workshop content.

**Psychological management of persisting pain**

NICHOLAS, M. (University of Sydney)

Psychologists are often a crucial part of multidisciplinary treatment plans for patients with persisting pain. However, despite the strong evidence for the utility of psychological interventions for people with persisting pain, there are often obstacles to their effective application. This workshop will focus on evidence based psychological interventions which can assist the pain sufferer to better manage their pain and return to a better quality lifestyle, whether at home or at work. Dr Nicholas will present a summary of current thinking about pain, its assessment and interventions applicable to the acute and chronic stages of pain. The focus will be on the importance of integrating our interventions with those of other key stakeholders, including
Abstracts of the 27th International Congress of Applied Psychology

medical and the physiotherapy interventions, as well as rehabilitation providers. The skills and knowledge-base psychologists should possess for this work will also be explored and practice in these skills will be provided as part of the session.

Cultural differences and ethical dilemmas in supervision

PETTIFOR, J. (University of Calgary), FALENDER, C. (University of California)

This cutting edge workshop by two highly esteemed North American psychologists challenges participants to address the ethical dilemmas that occur when supervisee, supervisor and client come from diverse cultures. These dilemmas arise in different contexts of power relationships, community expectations and of practice, teaching, research and administration. The issues are global wherever psychology hopes to flourish, and cannot be limited to any one region or jurisdiction. Multiculturism has received considerable attention in North America in the past few decades, especially in terms of the mainstream professional person interacting with the minority client. Supervision is only beginning to be considered a specialty area of psychological practice that requires competency-based education and practice standards. The application of ethical guidelines to the practice of supervision is even more recent and in terms of the ever-increasing mobility of psychologists across national boundaries even more urgent. The use of vignettes for educational purposes is widely used in bringing living reality to the consideration of abstract principles. Workshop objectives include to: 1) Understand the universality of respect for diverse persons and peoples; 2) Understand the behavioral specificity of cultural applications of respect; 3) Recognize approaches to ethical decision-making in supervision when cultures appear to collide; 4) Increase self-understanding and personal limitations in working across cultural divides; and 5) Increase commitment to humanitarian well-being world-wide. The workshop begins with an overview of the purpose of codes of ethics and codes of conduct from both philosophical and regulatory points of view. Small group exercises demonstrate how respect is shown in different cultures. Participants in group and plenary sessions become aware of the complexities of multicultural relationships in competency-based supervision. Discussants from China and Australia will enhance the international focus of the workshop.

Self-regulation as a key factor in delivering time-limited interventions to parents of children and adolescents with social, emotional and behavioural problems: Unpacking Triple P

RALPH, A. (University of Queensland)

This workshop introduces participants to the Triple P - Positive Parenting Program, a multi-level system of evidence-based interventions designed to provide parents with specific strategies to promote appropriate behaviour and manage inappropriate behaviour for their children up to the age of 16 years. The program is based on a combination of education about the developmental needs of children and adolescents, skills training to improve communication and problem-solving skills, plus specific modules to deal with common problems encountered by parents with their children and adolescents that can escalate into major conflict. The main components of the program will be described and the skills and strategies that parents can use to improve their parenting will be demonstrated and illustrated. Triple P utilises theories of developmental trajectories and incorporates an analysis of how interactions between parents and children come under strain as competing peer interactions become more frequent during adolescence. The self-regulatory approach which infuses the Triple P system and plays a key role in promoting generalisation and maintenance of behaviour change will be illustrated with video examples and practical exercises.

Nature and treatment of social phobia

RAPEE, R. (Macquarie University)

Social phobia affects around 5% of the Australian population in a 12-month period and impacts on all areas of life functioning. It is a chronic condition that starts young and is associated
with especially low levels of remission. Traditional treatments for social phobia have resulted in some of the lowest improvement rates for any anxiety disorder.

Over the past decade, researchers at the Centre for Emotional Health at Macquarie University have been working theoretically and empirically to improve our treatment for social phobia. This has resulted in a comprehensive treatment program that has been empirically validated and shown to produce larger effects than traditional “older-style” treatments. The aim of this workshop will be to describe the nature and treatment of social fears and anxieties in adults with particular focus on our current, “best-practice” treatment program. The workshop will begin at an introductory level, but will move onto more advanced applications. We will begin with coverage of the recognition of social fears and diagnosis of social phobia and related disorders in adults. The workshop will then move on to consideration of assessment issues and will provide an overview of current views of aetiology and maintenance of the problem. The majority of the workshop will concentrate on coverage of psychological treatment strategies. Basic components such as cognitive restructuring and exposure will be covered. More recent techniques such as attention training, the role of safety cues, and detailed feedback will also be addressed. Given time, difficulties in application such as comorbidity and other complications will be discussed. Where possible, the workshop will make use of case presentations, video, and role play.

Attendees will learn how to recognise and diagnose social phobia in adults, how to assess social fears, a better understanding of the possible causes and maintaining factors in social fears, current strategies in the management of social phobia.

The connected psychologist: e-Mental health applications in professional practice

REYNOLDS, J. (The Australian National University), CHRISTENSEN, H. (The Australian National University), GRIFFITHS, K. (The Australian National University)

Psychologists are increasingly being expected to understand e-health applications relevant to mental health and to be able to support clients who wish to use these programs safely and effectively. This workshop will provide a general overview of e-mental health applications including ethical considerations and the current status of research into internet programs for common mental health problems such as anxiety and depression. It will focus on 3 areas of e-health applications: automated self-help and therapeutic programs; tools which support consumers to understand mental health and make decisions about treatment; and online peer and carer support groups. Participants will have the opportunity to interact with 5 highly credible programs which are available to the general public free of charge. Case studies will be presented to demonstrate how these programs may support the delivery of psychological services in various care settings. The workshop will be interactive and discussion of psychologists’ experiences and concerns about internet mental health applications will be encouraged and considered in future e-hub developments. During the workshop, interested practitioners will be invited to join a reference group to participate in ongoing development and research.

Clinical neuropsychology

RUFF, R. (University of California)
The brain subserves the areas of cognitive, emotional, and physical functioning. Neuropsychologists specialize in determining the effects of brain damage on cognitive and emotional functioning. The aim of the workshop is provide an overview of applied neuropsychology. Topic covered in the workshop include (1) a historical perspective and scientific framework for understanding the relationship between brain and behavior. (2) The range of clinical applications that neuropsychologists provide in both the inpatient and outpatient medical settings will be addressed. (3) The theoretical background will be coupled with the psychometric measures that are currently being used for assessing language abilities, visual-spatial integration, attention, memory, learning, and executive functioning. Within each of these domains, the brain’s ability to process information both sequentially and simultaneously will be examined. (4) The challenges of prognosticating from neuropsychological tests to daily functions (ecological validity) will be addressed. (5) Finally, new approaches will be introduced for cognitive remediation and adaptive psychotherapy for individuals with acquired brain damage.

**Action research in applied contexts**

SOMMER, R. (University of California)

Because so much psychological research remains buried in file drawers or is published in journals not read by practitioners or the public, or is proprietary, social psychologist Kurt Lewin developed action research (AR) with tripartite goals: to advance knowledge, to improve a local situation, and to improve the utility of action research through reflective practice. In Lewin's view, all three objectives can be accomplished within the bounds of a research program. The guiding principle of AR is the intensive involvement throughout the research of potential users of the information. To achieve its tripartite goals, AR requires multimodal dissemination. This is not business as usual for the psychologist, it is a different type of business. Following a discussion of the nature of AR, I will provide examples of its utility in five applied contexts. Delivery of the research report was followed by post-research evaluation to document the distribution and impact of the research:

1. The conversion of a Canadian psychiatric hospital into a questioning community and experimenting society. I will also discuss the early liaison between psychologists and architects.
2. The development and promotion of farmers markets.
3. Research to assist consumer cooperatives.
4. Research to assist parents of mental health clients.
5. Research to assist community tree-planting organizations who are part of Global Re-Leaf.

No single form of dissemination will be adequate for satisfying Lewin's three goals for action research. The last hour of the Workshop will describe the range of outlets available in AR, with a specific focus on writing for practitioners and the public. In addition to basic, applied and professional journals, potential print outlets include trade magazines, general magazines, newspapers, and newsletters, plus oral presentations at meetings, and use of digital media. Time permitting, I will discuss the special nature and benefits of local research and local dissemination.

**Incorporating cognitive behaviour therapy in community settings: The case of hoarding**

STEKETEE, G. (Boston University)

Professor Gail Steketee is Professor and Dean of the School of Social Work at Boston University, USA. Together with Randy Frost, Gail Steketee has developed a cognitive-behavioural approach to treating hoarding problems of excessive acquiring, difficulty discarding and extensive clutter that causes distress and interferes with functioning. This workshop will focus on how this treatment can be disseminated to community practitioners with varying degrees of professional training, including to undergraduate student assistants, paraprofessional coaches and professional organisers. Professor Steketee will discuss community-based task forces developed to deal with hoarding, as well as training and supervision supports, and community-based intervention programs. The half-day workshop will be of special interest to psychologists and
psychiatrists as well as health and mental health care workers, social service providers, elder service providers, housing workers, fire and police services, and professional organisers.

Self-care when treating personality disordered patients

STEVENS, B. (University of Canberra)

There are risks working with personality disordered clients. This will be explored with a focus on those who meet the criteria for Borderline and Anti-social (psychopathic) Personality Disorders. Topics will include emotional costs in treating such clients, counter-transference themes, boundary issues, differences in expressing anger with the different personality disorders and potential legal complications including complaints to registration boards. There will be a discussion about the increased risk of boundary crossings and sexual involvement by practitioners, and an opportunity to consider different ways of self-care while busy in practice. The workshop will provide opportunity for discussion in table groups and in response to lecture material in the whole group. Brief video extracts from Play Misty for Me and The Sopranos will be shown. Participants will be provided with notes from the workshop and a copy of overhead slides.

Mood profiling in sports psychology

TERRY, P. (University of Southern Queensland)

Getting in the right mood for athletic competition is seen by many athletes and coaches as an important part of the process of mental preparation, and the success or failure to do so is often presented by athletes as an attribution to explain performance outcomes. This workshop will address the what, why and how of mood assessment and mood regulation for athletes, especially those preparing for international competition. The assessment of pre-competition mood, referred to as mood profiling, has a long history in the world of sport psychology. Mood profiling can assist processes such as acclimatisation, determining optimal training load, tapering, monitoring injured athletes, problem identification and also act as a catalyst for discussion. The mood regulation process involves assessment and interpretation of mood responses, followed by prescription of evidence-based interventions that, ideally, have been pre-learnt and practised. In particular, this workshop will explain how to administer, score, and interpret the Brunel Mood Scale (BRUMS: Terry, Lane, Lane, & Keohane, 1999; Terry, Lane, & Fogarty, 2003), a 24-item measure that assesses six dimensions of mood – anger, confusion, depression, fatigue, tension, vigour – that have been shown to be predictive of sport performance (Beedie, Terry, & Lane, 2000). The workshop will include examples of mood regulation strategies that have been shown to be effective among athletes (Terry, Dinsdale, Karageorghis, & Lane, 2006), many of which are very easy to implement. Workshop participants will be provided with a BRUMS User Guide.

Treating anorexia nervosa: Addressing nutritional, motivational, and cognitive Issues

WADE, T. (Flinders University)

Anorexia nervosa is an eating disorder characterized by low weight, medical complications, and a strong ambivalence about recovering nutritional health. This workshop outlines assessment and treatment of anorexia nervosa, based on the Cognitive Interpersonal model developed by Janet Treasure and Ulrike Schmidt at the Institute of Psychiatry in London. It will commence with an outline of this theory, and then summarise the therapy derived from this theory, called the Maudsley Anorexia Nervosa Outpatient Treatment for Adults (MANTRA). A recent update of an empirical evaluation of the therapy will be presented. A review of current assessment tools will be provided, as will their use in a way that promotes rather than hinders engagement. A detailed outline of the therapy will be provided, including use of motivational interviewing strategies, use of therapeutic writing, and cognitive behaviour therapy strategies. Examples of therapy and obstacles to treatment will be discussed in the context of case studies.
Advanced training in acceptance and commitment therapy for depression

ZETTLE, R. (Wichita State University)

This workshop focuses on extending and applying acceptance and commitment therapy (ACT) in working with clients who struggle with depression. Accordingly, it is strongly recommended that those in attendance have already completed an introductory ACT workshop. Brief coverage of the ACT theory of depression and the various processes and pathways that contribute to its initiation, maintenance, and exacerbation consistent with the broader ACT-model of human suffering and psychological inflexibility will be provided before focusing on key therapeutic skills and processes such as instigating value-directed behavioral change by removing psychological barriers that stand in the way of valuing. Because the most useful way to learn ACT is to do it rather than merely talk about it, the workshop will be more experiential than didactic in nature, with those in attendance invited to participate in numerous exercises, role plays, and demonstrations that illustrate the processes that contribute to depression as well as the overall approach and basic skills central in effectively working with clients who struggle with this wide-spread form of human suffering.

Introduction to acceptance and commitment therapy

ZETTLE, R. (Wichita State University)

This workshop will provide an introduction to as well as an overview on how to conduct acceptance and commitment therapy (ACT) with clients experiencing a wide range of human suffering. Brief coverage of functional contextualism as the philosophical foundation for ACT and of relational frame theory as a functional contextualistic account of language and cognition will be provided before introducing the ACT-models of human suffering and psychological growth and flexibility. Because the most useful way to learn ACT is to do it rather than merely talk about it, the workshop will be more experiential than didactic in nature, with those in attendance invited to participate in numerous exercises, role plays, and demonstrations that illustrate the overall approach and basic skills that comprise ACT.
Debates
Have evidence based practice and empirically supported treatments improved consumer outcomes? Or are they just window dressing for an unscientific profession?

Evidence-based approaches to psychological practice are touted to have led to a range of improvements in psychological practice and training, and even improved outcomes for consumers of psychological services. However, many argue that evidence-based practice is built on group data, and may have little relevance to individual contexts. In the clinical arena, some argue that positive outcomes are based on the quality of the relationship between psychologist and client, and that the notion of “empirically supported treatments” panders to the expectations of “bean counters.” Cynics go so far as to argue that psychologists are actually unscientific in their approach to practice, and that their purported allegiance to evidence based practice is no more than window dressing. Leading experts in this field will examine such arguments and articulate a comprehensive argument for and against evidence based practice.

Is technology making psychologists redundant?

Online psychological assessments and treatments, internet-based information sources, online research projects, and social networking sites have proliferated over the past 10 years. Such developments are fast changing the nature of psychological practice and, as they become increasingly more sophisticated, may render psychologists redundant. Leading experts in this field will examine arguments for and against the perceived limited lifespan of psychology as a profession.

Prescription rights for Psychologists?

In advocating for increased psychological services that aim to improve community wellbeing, professional psychology organizations cannot ignore the need to pursue training and accreditation of psychologists in the area of prescription rights for psychoactive medications. This is particularly true when one considers rural and remote populations, groups with compromised communication skills, and a limited workforce. However, such prescription rights might fundamentally change the nature of psychological practice and compromise our specialist skills. Leading experts in this field will examine such arguments and articulate a comprehensive argument for and against prescription rights for psychologists.

Psychologists as agents for social change: Are we relevant to the greatest moral challenge of our time – climate change?

Many psychologists around the globe are speaking up about the important role that psychologists can play in dealing with the challenges of climate change (e.g., Swim et al., 2009; Gifford, 2008; Kazdin, 2009). But to what extent should psychologists be involved? Should we limit ourselves to important work in research, in fostering pro-environmental behaviour change, in helping people adapt to changing environments? Or do psychologists also have a responsibility to ring the alarm bells and alert the wider community to the looming threats to our health and survival? Do we have a duty to warn? Do we have a duty to scale up our activity to protect the future health of people all over the world? If we decide that we do have a social and moral responsibility, how effective can we be in bringing about change? How well do we match our rhetoric with our actions? As a professional organisation? As individual citizens? Or is it none of our business because we are scientists who don’t get involved in politics, or clinicians who are mainly treating people with mental health problems? Is our science too conservative or our profession too self-focussed to make a difference? Or even if we wanted to be involved, is psychology really a very weak base for social change? This session will take the form of a Hypothetical, where an imaginary situation is created and a selected panel of experts set about solving a practical problem that involves many of these urgent and riveting questions and challenges, with opportunity for audience participation as well.
The Third Wave of psychotherapies: Tsunami or trickle?

Cognitive-behavioural approaches to psychological practice have been in the ascendancy over the past 20 years. However, in the clinical arena at least, evidence has emerged of their limitations. As a result, therapists have looked beyond CBT to improve client engagement and outcomes. A “third wave” of therapies has emerged incorporating mindfulness-based practice, acceptance strategies, self-based interventions, and even metacognitive approaches. These “third wave” therapies have become enormously popular amongst practitioners. But how different are these approaches to CBT? Are they akin to CBT in different “clothing?” And are they vulnerable to the same limitations as CBT? Some argue that this “third wave” of psychotherapies is just a passing phase, and that in 10 years time it will be no more than a trickle. Leading experts in this field will examine such arguments and articulate a comprehensive argument for and against the notion that the third wave of psychotherapies constitutes a “tsunami”.

Abstracts of the 27th International Congress of Applied Psychology
Abstracts of the 27th International Congress of Applied Psychology

Forums, Panels and Roundtables
2010 World Psychology Forum

KNOWLES, M. (Monash University), SILBEREISEN, R. (University of Jena)

Co-hosted by the International Association of Applied Psychology and the International Union of Psychological Science, the World Psychology Forum will bring together officers and representatives from the world’s international and regional psychology organizations to foster discussion about major advances in psychology of which politicians and the general public are essentially unaware. The Forum will focus upon the topic of well-being and the appreciable expertise based upon research that the discipline of psychology currently possesses. Representatives from the above international and regional psychology organizations will present a brief review of the major advances that their fields of specialisation have made in contributing to improving well-being. This will be either in the more channelled sense of subjective well-being (affective = positive/negative emotions, cognitive = satisfaction with life) or in the broader sense of psychologically relevant aspects of quality of life, as caught in various indices on the political arena of which the human development index would be an example. Issues related to making this expertise available to the public in general or politicians in particular may also be addressed. All delegates at the Congress are cordially invited to attend.

A case study in relationship counselling: Is evidence based therapy a goal or a dream?

STEVENS, B. (University of Canberra), DADDS, M. (University of New South Wales), HALFORD, K. (University of Queensland), HOISE, E. (Private Practice), BRAY, J. (Baylor College of Medicine), GORDON, A. (Private Practice)

A case study will be presented in relationship counselling. There are different evidence based treatment approaches to treating couples. There will be a focus on the practical aspects of treatment with case formulation, treatment options and what might be expected in terms of improvement (or otherwise). There will also be an opportunity to discuss what both clinical and counselling psychology might have to offer in relationship therapy.

A case study in the treatment of an offender: Evidence based treatment approaches in forensic psychology

STEVENS, B. (University of Canberra), OGLOFF, J. (Monash University), COXON, L. (Private Practice), ZETTLE, R. (Wichita State University), MONTGOMERY, B. (Private Practice)

A case study will be presented with treatment of an incarcerated offender. What evidence based treatment approaches might be appropriate? What are the potential difficulties? There will be a focus on the practical aspects of treatment and a strong applied dimension to the discussion. The possible application of Acceptance and Commitment Therapy to this group will be considered and research possibilities raised. There will also be an opportunity to consider more broadly what both clinical and forensic psychology might have to offer.

A cross-cultural research incubator on applicant reactions: Expanding the cross-cultural frontier

CARLESS, S. (Monash University)

The proposed research incubator is designed to get new culturally relevant ideas to make sure that individuals feel fully invested, and to provide a forum as an active exchange between researchers in this field. During the session, participants will share their interests in the topic, explore major issues and trends in the area, narrow their focus to specific research questions and hypotheses, and organize specific research projects that have the potential to produce publications in top-flight Work, Industrial, and Organizational Psychology and Management journals. Attendees will also follow up on previous contacts, projects, and collaborative efforts that are on-going. An international team of experts on the topic will serve as facilitators for the session, with the aim of building research ideas and collaborations among participants. In this capacity, facilitators will identify key areas that require attention in the field, provide feedback and editorial suggestions on research
ideas, and provide any other help that motivates international collaborations. Anyone who is interested in participating in research on this topic cross-culturally is welcome to attend. The session will therefore provide the ideal form for partnerships to be made among (1) established and newly emerging researchers, (2) researchers interested in tackling questions in different substantive areas (e.g., stress, culture, attitudes, selection, leadership), (3) academics and practitioners, and (4) researchers from different geographical locations.

A model of interdisciplinary assessment and treatment of ASD

It is increasingly recognised that best practice assessment and treatment of ASD requires an interdisciplinary approach including medical, allied health and educational specialists. As part of an Australian Government initiative the APS worked in collaboration with Speech Pathology Australia and Occupational Therapy Australia to produce an education and information package to promote interdisciplinary practice for health professionals working with children with ASD. Using case study presentation a model will be provided to demonstrate how interdisciplinary practices can be applied in different care settings and the role of general practitioners, medical specialists and allied health professionals. The presentation will involve contributions from a psychologist, occupational therapist, speech pathologist and a paediatrician. Whilst all therapists work privately as sole providers, all are dedicated to working as a team in order to gain the most effective, and often much more intricate and complex, understanding of the children in order to provide accurate management plans to families and schools.

A retirement research incubator: Expanding applied research frontiers

WANG, M. (University of Maryland), HESKETH, B. (University of Western Sydney), GRIFFIN, B. (Macquarie University)

The proposed research incubator is designed to provide a forum as an active exchange between researchers in the field of retirement research. During the session, participants will share their interests in the topic, explore major issues and trends in the area, narrow their focus to specific research questions and hypotheses, and organize specific research projects that have the potential to produce publications in top-tier Applied Psychology journals. Drs. Mo Wang, Beryl Hesketh, and Barbara Griffin will serve as facilitators for the session, with the aim of building research ideas and collaborations among participants. In this capacity, facilitators will identify key areas that require attention in the field, provide feedback and editorial suggestion on research ideas, and provide any other help that motivates international collaborations. Anyone who is interested in participating in research on this topic is welcome to attend. The session will therefore provide the ideal form for partnerships to be made among (1) established and newly emerging researchers, (2) researchers interested in tackling questions in different aspects of retirement research, (3) academics and practitioners, and (4) researchers from different geographical locations.

Applied critique? Community critical psychology in action

FRYER, D. (Charles Sturt University), GIOLLA EASPAIG, B.N. (Charles Sturt University), FOX, R. (Charles Sturt University), FREEMAN, L. (York St John University), LAUFFENBURGER, S.K. (Charles Sturt University), MCCORMACK, C. (Easterhouse), SONN, C. (Victoria University), VENO, A. (Victoria University)

The panel will discuss the importance of developing and enacting politically progressive community critical psychologies as contributions to the collective transformation of social reality to address the misery and injustice characterizing contemporary societies. The discussion aims to explore how the practical engagedness, community relevance and commitment to intervention and prevention characteristic of community psychology, and the intellectual sophistication, progressive ideology and radical reflexivity characteristic of critical psychology can be combined to effectively tackle contemporary immiseration. This includes
psychologically toxic unemployment, gendered abuse, disabling educational practices, contemporary colonisation, material inequality and abject poverty, racism, psy-governmentality and further assaults on the already marginal and depowered. The panelists are Brona Nic Gilla Easpaig, postgraduate student at Charles Sturt University, who is engaged in community critical praxis in relation to sexual violence; Rachael Fox, community critical psychologist and lecturer in psychology at Charles Sturt University, who is engaged in community critical praxis in relation to school exclusion and childhood economic migration; Lizzie Freeman, postgraduate student at York St John University, York, England, whose relevant interest is in critical pedagogy; David Fryer (Chairperson), professor of community critical psychology at Charles Sturt University, President of the European Community Psychology Association 2009-2011, and critical unemployment researcher; Sandra Kay Lauffenburger, chronic pain therapist and researcher, Canberra; Ibrahim Makkawi, professor of community psychology at Birzeit University, Palestine, whose relevant interest is in contemporary colonisation; Cathy McCormack, psychologist and activist, Chair of Conquest for Life, Johannesburg; Dr Saths Cooper, psychologist and political activist, Chair of Conquest for Life, Johannesburg; and Professor Beryl Hesketh, former Pro-Vice-Chancellor (Sciences and Technology) at the University of Sydney.

Are we developing the right leaders for the future?

GORDON, A. (Private Practice), BLOCH, B., COOPER, S., LAWRENCE, C., PATTERSON, K.

Leaders may be born – but they can also be developed. Psychologists could play a key role in ensuring that our leaders are ready and able to meet the challenges of the 21st century. Perhaps we could assist those without the genetic skills – elected into power – to manage their position responsibly and lead nations into a peaceful and sustainable age. Panelists include Amanda Gordon, former APS President, and initiator of the APS Strategic Leadership Programme; Barry Bloch, Director of Heidrick & Struggles, where he has provided both coaching and top team facilitation to many non-executive and executive teams and individuals, and also designed and implemented senior executive level assessment and development centres; Dr Saths Cooper, psychologist and political activist, Chair of Conquest for Life, Johannesburg; and Professor Beryl Hesketh, former Pro-Vice-Chancellor (Sciences and Technology) at the University of Sydney.

Behaviour change and patient centred care in chronic illness management in China

This paper reviews the contributions of behaviour change and patient centred approaches to chronic illness management in China. As in many countries in the world, China is facing the significant challenge of population ageing and the increasing burden of chronic diseases. Recent Chinese health system reforms have focused on strengthening community-based health services to better meet the needs of citizens through primary health care and multidisciplinary services. Diabetes is one of the most common chronic conditions in the Chinese urban community. In the past Chinese clinicians have used conventional medical interventions to treat chronic illnesses such as diabetes but these have had mixed results. Recently, in a joint program of the Beijing Government, Fangzhuang Community Health Service, Monash University Australia, Peking University China and the Australian Psychological Society, the Happy Life Club (HLC) has been established in Beijing. The HLC is built on the experience of the Australian

Forums, Panels and Roundtables
Good Life Club. In both programs behaviour change techniques (motivational interviewing) and patient centred principles and practices have been used to treat chronic illnesses with an emphasis upon diabetes and coronary heart disease, with promising results. The implications of and prospects for the use of these approaches in the Chinese health system is discussed. These include policy implications, training requirements and implications for service design and delivery in China as a new and creative way of addressing the burden of chronic illness.

Challenging times for the Australian Health Reform Agenda — where does psychology fit? Consumers and carers speak out

LOVELOCK, H. (Australian Psychological Society)

The aim of this Forum is to bring the ‘human face’ to the discussions around the proposed reform of the Australian health care system which includes mental health. A consumer and a carer from the national mental health advocacy peak body, the Private Mental Health Consumer Carer Network (Australia) will give their individual perspectives of where they see psychology fitting within this reform. These presentations will be followed by a representative from the Australian Health Care Reform Alliance (AHCRA), a non government body of 50 organisations representing consumers and health care providers advocating for a fairer and more effective health care system. The Forum will consist of the three twenty minute presentations with time at the conclusion for questions and discussion. The audience will be encouraged to explore the issues raised in the presentations and suggest ways to overcome any perceived problems. It is anticipated that a greater appreciation of a health care system based on the views of the recipients of that care and those that care for them, will be received as a positive resource for psychologists in the crucial role that they play. In designing health systems the focus must be on equitable access to consumer centred, safe, high quality and timely treatment. However, Governments often have difficulties in designing what consumers and their carers perceive as consumer centred care and the mental health area is no different in this regard. This is an opportunity for psychologists, allied mental health professionals, general practitioners, Governments and others to hear what consumers and carers think about the proposed Australian Health Reform Agenda and mental health in particular and how psychology fits into that process.

Communicating for change: Motivational Interviewing in the workplace

MENTHA, H. (Private Practice)

Motivational Interviewing emerged over 25 years ago in the addictions field. Since then, it has raised relevant questions and offered practical strategies to help us communicate more effectively across the change process from resistance to action. Over 200 published research studies have examined the use of MI in more traditional applications within counseling, medical and correctional services. But what can MI offer in more corporate settings? This practical session provides a taste of MI and how it can facilitate effective communication in the workplace.

Development of the National Registration and Accreditation Scheme in Australia

GRENYER, B. (Psychology Board of Australia), ALLAN, A. (Edith Cowan University), STARK, A. (Private Practice), GALLAS, G. (Defence Force Psychology Organisation)

This panel will provide an overview of the recently introduced National Registration and Accreditation Scheme for the Health Professions (NRAS) in Australia including the functions of the newly formed Psychology Board of Australia (PBA). The Chair of the Psychology Board of Australia will provide an overview of the Scheme and its underpinning legislation, followed by brief presentations from Board members on key aspects of the registration system. The Executive Director of the Australian Psychological Society will provide a presentation on the impact of the Scheme for Australian psychologists, followed by a question and answer session. Participants include: Brin Grenyer, Chair of the Psychology Board of Australia, members of the Board Ann Stark, Geoff Gallas and Alfred Allan, and Lyn
Littlefield, Executive Director of the Australian Psychological Society.

**Genocide: Confronting the unthinkable**

Talking about genocide takes us to the heart of what it is to be human, as individuals and as members of the human collective. Genocide scholarship extends beyond the perimeters of a single discipline, and none can lay claim to a definitive explanation for ‘ethnic cleansing’, systematic persecution or the ‘chronic genocide’ of colonisation. In this forum, panelists will respond from psychological, historical, Indigenous and human rights perspectives to Professor Paul Slovic’s opening keynote address that provides a psychological account of genocide, alongside its legal and institutional implications. The floor will then be opened for contributions from conference delegates, facilitated by the Chair. Central to the discussion is the social responsibility of psychologists – what role can psychological understandings play in preventing and responding to genocide? What are the pre-conditions for mass murder and deliberate annihilation of the kind and scale humanity has seen, permitted and perpetrated, particularly in the past hundred years? The psychological and political mechanisms that enable the slow development of risk factors over time, and the failures of “genocide lessons” in the 20th Century, will be discussed. The forum will look beyond the psychology of perpetrators to consider the propensity for humans to turn their back on genocide, and the processes involved in dehumanization and large-scale bystander effects. Survivors’ voices will be presented as a counter to the distancing and minimisation that typically occurs. The designation of ‘worthy and unworthy’ victims is under-researched, and this ‘blaming the victim’ rhetoric remains post-genocide, often directed towards Indigenous peoples, and refugees. The meaning of recovery for survivors and their communities is fraught, especially when survivors live alongside perpetrators, individually and collectively. What are the obligations of professionals, institutions and civil society in combatting a sense of impunity for perpetrators and the dehumanization of mass victims? The limits to human compassion, the need to strengthen international law and the problems associated with an enhanced, inward-looking sense of nationhood will be discussed, as well as the implications for other mass tragedies, such as poverty, famine, disease, and environmental destruction.

**Global perspectives on undergraduate psychology education: Should we be changing our game?**

CRANNEY, J. (University of New South Wales), TRAPP, A. (United Kingdom Psychology Network), SARWONO, S. (Persada Indonesia University), MCCARTHY, S. (Northern Arizona University, Yuma), SKINNER, N. (King’s College at the University of Western Ontario)

What are our objectives for undergraduate psychology, and should these be reexamined in light of our students’ global futures? Given the objectives, what kind of curriculum and educational practices will facilitate achievement of those objectives? This panel discussion will inform the audience of international trends in undergraduate education, discuss and record ideas about what should (and should not) be key aspects and content of the undergraduate psychology curriculum, and discuss and record ideas about how university educators can best work together to maximise quality student learning outcomes.

**Going global with Lesbian, Gay, Bisexual and Transgender Issues: How psychology can contribute**

Global attention to human rights issues and concerns of Lesbian, Gay, Bisexual and Transgender (LGBT) populations is increasing
rapidly in ways both favorable and alarming. This panel will consider psychology’s potential role in research, clinical practice and application initiatives in this cutting edge arena, particularly as it relates to potential impacts on organizational and state policy. From a vote in the UN General Assembly on a non-binding statement in December, 2008, calling for international agreement on decriminalizing homosexuality, to legislative efforts in Uganda in 2009 to enhance criminalization of same-sex behavior to include the death penalty – as well as to criminalize family, neighbors, colleagues and health care professionals who don’t promptly report suspected homosexuals – the mental health and well-being implications are urgent and far reaching. At stake in this debate are not only matters of human rights as they pertain to LGBT populations per se, but also the crucial intersections as they relate to civil society, women’s development, health/sexual health/HIV-AIDS prevention and children and families – all rich terrain for research, practice and application. The purpose of the panel is to bring attention to this rapid global increase in attention, and to promote awareness of the aims of the International Network on Lesbian, Gay and Bisexual Issues and Transgender Concerns in Psychology. Its aims include promotion of cross-cultural collaboration and application of research among psychological researchers and practitioners concerned about the mental health and well-being of LGBT populations through discussion of, and action on, specific goals for organizational and state policy, clinical practice, and various application initiatives. Specific examples will be considered, including one network member organization's involvement in LGBT issues and the network, and LGBT issues and concerns related to policies and initiatives of the International Union of Psychological Science. The scope and nature of this topic are most closely related to IAAP Divisions 3, 8 and 10. Panelists are all actively involved in the network as well as other international organizations in psychology working to promote the connections between research, policy, and healthy mental health and well-being outcomes for LGBT people and their families.

Health impacts of climate change

PRIOR, M. (University of Melbourne), WISEMAN, J. (University of Melbourne), BURKE, S. (Australian Psychological Society), ARMSTRONG, F. (Private Practice), LIDDELL, B. (University of New South Wales)

This forum will explore the health impacts of climate change, with a specific focus on the mental health and psychosocial impacts. Climate change impacts in three major ways on people’s mental health. In this forum, we will explore the direct impacts on health from natural disasters and extreme weather events, including consequences for environmental refugees, events that are predicted to increase in frequency and severity, and which are attributed in large part to our changing environment. Next we will examine the impacts of climate change (and mitigation and adaptation policies) on the social, economic and environmental determinants of mental health and wellbeing. Finally, we will explore the range of psychological responses to learning about climate change, from avoidance to anxiety to action, and look at the barriers and motivators for pro-environmental change at an individual, community, and political level. In acknowledging these significant health and wellbeing impacts, the APS is taking a leadership role in supporting research and action on the psychosocial impacts of climate change, and what we can do about it.

Health management of psychologists and their professional practice

Psychologists face the same types of life pressures as their clients while also researching, reflecting, responding, and reviewing the behaviors of their clients and members of the public generally. These multiple levels of experiencing stress and trauma by psychologists may challenge, inform and/or impair professional practice. A substantial range and
depth of research has been published on health issues of psychologists in the United States, and represented by the Collegial Assistance operating in California. The diversity in panel members enables various research and practice approaches to be explored in discussion. The panel represents expertise in working with severe clinical clients, unhelpful belief systems of therapists, health practices of psychologists, reflecting on family "dreams" of therapists and clients and dealing with claims of malpractice. The panel discussion aims to outline a range of health issues affecting the professional practice of psychologists and explore further unidentified health issues of psychologists. It will also consider the approaches to monitoring and intervening with psychologists impaired by health issues and the approaches to health maintenance and recovery of psychologists. Dr. Elizabeth Celi has been a privately practicing psychologist, both inner city and regional, for 7 years. Having diversified her business further with professional speaking and a Personal Training franchise (2003-2006), diligent self care has been a core agenda item. The vital mental and physical energy management required for the intricacies of a psychologist’s work will be emphasized with strategies for developing a sustainable self care schedule. Professor Tracey Wade trains postgraduate clinical psychology students in Cognitive Behavior Therapy (CBT) at Flinders University in South Australia and also supervises students and psychologists in therapeutic work in eating disorders. She has worked as a clinical psychologist for over 20 years and works predominantly in a CBT framework. Over the last 7 years she has been conducting research into the types of beliefs about therapy that therapists can hold that may be unhelpful for their stress and burnout. Kaye Frankcom has been involved in regulating the psychology profession as President of the Psychologists Registration Board of Victoria and more recently as the Victorian appointee to the Psychology Board of Australia. She is a proponent of therapeutic jurisprudence. The balancing of the protection of the public and supporting an impaired psychologist to continue to practice safely has been a common theme in her work in health regulation. Dr Jamie Lee has worked for Relationships Australia (SA), South Australia’s largest non-government provider of health and community services, since migrating to Australia in 2006. His clinical role is in family relationships counselling, in particular with children and their families after parental separation. He also has responsibility for coordinating research projects across Relationships Australia (SA) and has an interest in client assessment and outcomes research. Jamie is a member of the Australian Psychological Society's College of Counselling Psychologists. Dr Bruce A Stevens (PhD Boston University 1987, MAPS Clinical and Forensic Colleges) founded Canberra Clinical and Forensic Psychology in Canberra in 1995. He is an Associate Professor in clinical psychology at the University of Canberra (and SCD). He has lectured in the DClinPsych program at Australian National University and has supervised clinical students from both universities. Dr Stevens has a research position at Charles Sturt University and has written four books, including Mirror Mirror (2001) on how personality disorder affects intimate relationships and Cross Fire! about cross examination skills for psychologists (Australian Academic Press, 2008). He is also a member of the national private practice advisory group and the governance review committee for the Australian Psychological Society. Dr Bernadette Moore has over 17 years experience as a psychologist. She retired in 2008 from her position as Associate Professor of Psychology at Victoria University and was subsequently appointed Director of Psychology for Central Queensland Health Services. As a clinical psychologist, who also manages a private practice, Dr Moore has a long standing interest in the interaction between a psychology practitioner’s personal experiences of depression and the impact of that experience on subsequent therapeutic practice. Dr Dani Beckerman, Psy.D., has chaired the California Psychological Association’s Colleagues Assistance and Support Program (CPA CLASP) since 2005 and has served as a CPA BOD representative, as well as acting as the 2004 President of the Monterey Bay Psychological Association. She has a private practice in Santa Cruz, CA specializing in self care, personal growth and intimacy. Dr. Beckerman is very active in developing collaborative communities of support and consultation groups for health care professions in her community. Currently in collaboration with APA ACCA, she is investigating the state of well-being, obstacles to obtaining
support, protective/risk factors as well as preventive/interventions facing psychologists in the US. Furthermore, she has taught and continues to trains students, psychologists, therapists, and psychiatrists on group process, self care for health care professionals, and sexuality and desire issues across the Bay area.

Bev Ernst, Private Practice Advisor, Australian Psychological Society (APS) has been a central figure in the APS Health Issues of Psychologists Task Force, contributed to the development of the APS Peer Supervision Group networks across Australia and overseen developments on the professional society’s website to include issues of self-care.

Health reform in Australia and the United States

LITTLEFIELD, L. (Australian Psychological Society), KNOWLES, R. (Health and Hospitals Reform Commission), NORDAL, K. (American Psychological Association)

Australia is going through a period of significant health reform to meet the needs of an ageing population and an increasing burden of chronic disease. The Australian Government has committed to delivering better health outcomes for the community and the provision of sustainable improvements in the performance of the health system. Three separate bodies were established to review the major components of the Australian health system: the National Health and Hospitals Reform Commission (NHHRC), the National Primary Health Care Taskforce (NPHCT) and the National Preventative Health Taskforce (NPHT). The Federal Government has responded to their recommendations by taking over much of the funding for health care, including primary health care and the hospital system, restructuring the primary care system and focusing on preventative health care. The first paper in this forum, presented by The Hon. Rob Knowles, a member of the NHHRC, will outline the major recommendations of this Commission and the Australian Government’s response to date. The second paper, presented by Professor Lyn Littlefield, a member of the NPHCT, will outline the Government’s response to the Taskforce’s recommendations, focusing on the area of mental health and the potential impact on psychologists. The third presentation by Dr Kathryn Nordal, the Executive Director of the Practice Directorate at the American Psychological Association, will outline the current health reforms in the US. Her paper is titled ‘The Paul Wellstone and Pete Domenici Mental Health Parity and Addiction Equity Act (MHPAEA) and the Patient Protection and Affordable Care Act (PPRACA): Implications for health care practice for psychologists’. These papers will be followed by open discussion with the panel.

High school psychology and first-year university psychology: Challenges and opportunities

PROVOST, S. (Southern Cross University), BOWLES, T. (Australian Catholic University), CARROLL, P. (Department of Education, WA), MARTIN, F. (University of Tasmania), REECE, J. (RMIT University), SKINNER, N. (University of Western Ontario), TRAPP, A. (UK Psychology Network), VOUĐOURIS, N. (Australian Psychological Society)

Some of the challenges include constructing a national curriculum for psychological science, supporting high school teachers in psychology, and catering for first-year university psychology students who have, and have not, studied high school psychology. This panel discussion aims to inform the audience of national and international issues regarding high school psychology, and to discuss and record ideas about what should (and should not) be key aspects and content of a national high school psychology curriculum. We will also discuss and record ideas about how high school and university educators can best work together to deliver quality student learning outcomes across secondary and tertiary psychology education. Steve Provost, Southern Cross University, has undertaken research into high school psychology teachers in Australia. Terry Bowles, University of Ballarat, is the chair of the APS College of Educational and Developmental Psychologists, and has worked with high school teachers in Victoria. Paula Carroll, Department of Education, Western Australia, is leading the implementation of the new psychology curriculum in WA schools. Frances Martin, University of Tasmania, is involved in outreach to high school teachers in Tasmania, which was
the first state in Australia to introduce high school psychology. John Reece, RMIT University, has conducted research into high school psychology in Victoria, which has the largest number of high school students undertaking psychology. Nicholas Skinner, University of Western Ontario, will give a brief Canadian perspective. Annie Trapp, Director, UK Psychology Network, has undertaken research into high school psychology in the UK, and Nicholas Voudouris, Australian Psychological Society, has been involved in discussions regarding the Australian National Curriculum for Psychology.

**Human rights’ issues confronting psychology in the 21st century**

COOPER, S. (Psychological Society of South Africa), BEHNKE, S. (American Psychological Association), GAUTHIER, J. (Laval University), NAIR, E. (Work and Health Psychologists)

The panel will discuss varying perspectives on ethical challenges in psychology that have arisen internationally since the beginning of this century. The 27th International Congress of Applied Psychology will provide the opportunity for key actors in the ethics field to provide insight on human rights issues that have confronted psychology over the past decade, in their own countries, and elsewhere. The panel aims to focus on the interface of human rights and psychological ethics, especially in a fast changing geo-political global order that has been indelibly altered in the aftermath of the 9/11 terror.

**IAAP at the United Nations**

IAAP has a significant presence at the United Nations. It has two representatives accredited to the Department of Public Information in New York and eight representatives accredited to the Economic and Social Council of the UN, five in New York, two in Geneva and one in Vienna. In addition there are a number of graduate students interning with the representatives. This session will present samples of their accomplishments to date to bring applied psychology to all aspects of the United Nations. Three of the representatives will be a part of the session and present a short video and examples of their contributions to the UN.

Among the contributions that will be described are the promotion of the inclusion in official UN documents of such issues as mental health, substance abuse treatment, climate change, decent work and gender equality. Representatives have conducted a survey among NGO representatives at the UN on the working relationship between the representatives and the Organization. The group has conducted luncheon workshops with staff from the UN Development Program including presentations on dealing with bureaucracy, building teams, project implementation, effective communication, enhancing cooperation / collaboration, and psycho-social interventions into post-conflict and post-disaster situations. In addition the representatives are working with the kingdom of Lesotho in Africa to develop and evaluate camps for adolescent girls who are AIDS orphans including education on HIV prevention and building self-esteem and resilience. Lesotho has among the highest per-capita rate of HIV in Africa. The representatives are also involved in the further development and evaluation of a Community Center in Haiti, which aims to enhance physical and mental health among Haitian children and families. The goal of the session is to acquaint the IAAP membership with the work that has been done and our plans for the future. We will also use this session to foster collaboration with the membership by asking for their input, to make them aware of the information we provide on the IAAP website, and to set up a procedure for members to communicate with the representatives in order to expand the reach of IAAP members within the UN environment.

**Internationalizing education in Work and Organizational Psychology. What competences W&O Psychologists need in a global world?**

PEIRÓ, J.M. (University of Valencia), LATHAM, G. (University of Toronto), KRAIGER, K. (Colorado
Globalization is affecting nearly every aspect of Work and Organizational Psychology, and our post-graduate education programs need to reflect our changing reality. Curricula have adapted to integrate international perspectives and to provide students opportunities to enhance their international competencies. Many are investigating creative ways to improve their students' readiness for the global workplace. Means of globalizing graduate curricula have included: adding global content to course work, recruiting students internationally, student and faculty exchanges, research partnerships, semesters abroad, and short-term study-abroad opportunities. Each of these means has advantages and disadvantages. None appear to provide a completely satisfactory solution to the challenge of internationalizing graduate education in work and organizational psychology. This round table is a continuation of the session previously held at the European Congress of W&O Psychology and its purpose is to bring together representatives of the European Association of Work and Organizational Psychology (EAWOP), the International Association of Applied Psychology (IAAP) - division one Organizational Psychology, and the Society for Industrial and Organizational Psychology (SIOP) along with interested audience members to discuss this topic. The following questions will be directed to the panelists, and the audience will be invited to join the discussion: (1) What currently works well in the internationalization of postgraduate education? (2) What does not work well? (3) Does technology offer any special opportunities? (4) How could these three organizations (IAAP, EAWOP, and SIOP) help? The session will begin with a description of its purpose and an introduction of the participants. Questions will be directed to the participants and then to the audience. A shorter time at the end will be devoted to identify some next steps that participants and attendees want to take.

Is applicant faking really a red herring? A whopper of a fish story

GRiffith, R. (Florida Institute of Technology), Ziegler, M. (Humboldt-Universität zu, Berlin), MacCann, C. (Sydney University), Roherts, R. (Educational Testing Service), KunCel, N. (The University of Minnesota), Backstrom, M. (University of Lund)

Although personality-based selection measures have become increasingly popular, a major concern in high-stakes selection settings is that applicants may fake their responses. A decade ago, conventional wisdom suggested that applicant faking was rare (Hough et al. 1991), was a simple phenomenon adequately captured by measures of social desirability, and produced a trivial effect on the criterion validities of personality measures (Ones et al. 1996). Opinions regarding the nature of applicant faking and its impact on personnel selection have changed considerably. Faking is now seen as prevalent (Arthur et al. 2009) and reflecting a complex interaction of person specific and situational factors that influence applicant responding (Kuncel & Telegen, 2009). In addition, the effect on validity may be more substantial than previously thought (Komar et al. 2008). This panel of personality research authors and practitioners will address questions regarding the phenomenon of faking and the research efforts to untangle it from the personality measurement process. The panelists will discuss current research, contemporary views on the nature of applicant faking, and the process by which applicants alter their responses. In addition, panelists will discuss methods to reduce the impact of faking and improve personality measurement. The questions that will be the primary focus of our discussion will center on the complexity of this behavior and the assumptions that may underlie current research. Panelists will be encouraged to move beyond their empirical work and to entertain and integrate competing models of faking behavior. Finally, audience members will be encouraged to participate to stimulate further research on the topic. To address these questions we will convene a panel of six experts in applicant faking behavior from around the world. Panel members have published over 200 articles in the area of personality research, and have recently authored applicant faking papers in Educational and Psychological Measurement, The European Journal of Psychological Assessment, The Journal of Business and Psychology, The International Journal of...
Selection and Assessment, and Personnel Psychology. Members of the panel have also served as co-editors of the books A Closer Examination of Applicant Faking Behavior and New Perspectives on Faking in Personality Assessments.

Meet the editor

This session provides the opportunity to meet editors/associate editors of several journals such as British Journal of Management, European Journal of Work and Organizational Psychology, Journal of Applied Psychology, and Journal of Business Venturing as well as editorial board members of other journals. The contributors will give tips around submitting to their journals and there is room for question from the audience.

National and international development of peace psychology

ITO, T. (Wako University), BRETHERTON, D. (Australian Centre for Peace and Conflict Studies), BOEHNKE, K. (Jacobs University Bremen), MONTIEL, C. (Ateneo de Manila University), MULUK, H. (University of Indonesia), NOOR, N. (International Islamic University), TINT, B. (Portland State University), BURKE, S. (Psychologists for Peace/Australian Psychological Society)

Psychologists have been interested in psychological aspects of war and peace since the beginning of modern psychology. During the 23rd International Congress of Psychology in Acapulco in 1984, a resolution "Psychologists for Peace" was endorsed by IUPsyS and the Committee for the Psychological Study of Peace (CPSP) was established to promote peace psychology worldwide. The most recent symposium, the 11th International Symposium on the Contributions of Psychology to Peace, was held in Coleraine, Northern Ireland in 2009. The aim of the present panel discussion is to exchange information on the state of the art and the future orientations of peace psychology in different countries, and seek further international networking to promote the psychological studies of peace issues. Takehiko Ito, Wako University (Japan), and Honorary Professor Di Bretherton of the Australian Centre for Peace and Conflict Studies, will chair the panel discussion. Professor Ito, a founding member of the Peace Psychology Division of Japanese Research Association of Psychological Science, will introduce the peace psychology movement of Japan. Professor Bretherton is the ex-president of the Division of Political Psychology of IAAP and a committee member of CPSP. She will review the history of peace psychology from an international perspective. Klaus Boehnke, Professor of Jacobs University Bremen (Germany) and the current President of IAAP Political Psychology Division will talk about peace psychology in Germany. Professor Cristina Montiel, Ateneo de Manila University (Philippines), will discuss peace psychology in the Philippines and Professor Hamdi Muluk, University of Indonesia, will explain the graduate course in peace psychology at his university. Professor Barbara Tint of Portland State University (USA) will cover the recent topics of Psychologists for Social Responsibility and the APA Division of Peace Psychology. Professor Noraini Noor of the International Islamic University, Malaysia, will discuss topics from an Islamic perspective, and Dr Susie Burke, the national convener of Psychologists for Peace in Australia, will talk about peace psychology in Australia.

National and international perspectives on rural and remote practice

GULLIFER, J. (Charles Sturt University), DRENT, A. (Private Practice), JOHNSON, M. (Private Practice), ERFST, B. (Private Practice), CAMPBELL, P. (Private Practice), BRAY, J. (Baylor College of Medicine, Houston), IDEMUDIA, E.S. (North West University), MALONE, J. (Private Practice)

The shortage of rural and remote health practitioners is well documented. Rural and remote practice is characterised by a diversity of healthcare needs, therefore rural health professionals need a variety of knowledge and skills. According to the Australian Psychological Society (APS) Guidelines for working in rural and remote practice, working in small communities
can be both rewarding and challenging. Members from the APS Rural and Remote Interest Group has explored the 'speciality' of working as generalist practitioners through various conference symposia and consultation with its members. Commonly expressed among practitioners is the knowledge base required to offer a variety of treatment modalities and community development approaches, whilst working with the 'lifespan' of community members. Alongside the challenges are many rewards, including, but are not limited to, the diversity of psychological work, the expectation of the community to provide diagnosis, treatment and follow up, and being part of a vibrant rural community. However, it has often been cited within the professional literature and the APS Guidelines that the four most common ethical issues confronting rural and remote practitioners are 1) limits to competence in a broad range of domains, especially when working with indigenous clients; 2) boundary management; 3) confidentiality; and 4) professional (as well as personal) isolation. The aim of the panel discussion is to bring together a number of national and international practitioners to explore their experience of working or researching in rural and remote regions.

New models of primary health care – innovative interdisciplinary collaboration

LITTLEFIELD, L. (Australian Psychological Society), LOVELOCK, H. (Australian Psychological Society), RAWLINS, M. (Royal Australian College of General Practitioners), RYAN, K. (Australian College of Mental Health Nurses), SNOWDEN, T. (Royal Australian and New Zealand College of Psychiatrists). The entities comprising MHPA have worked together on advocacy for better services for consumers and the scope of mental health services, focusing on collaboration between their professions. In 2009 MHPA was awarded a grant from the Federal Government to work together to establish groups of mental health professionals in local areas for collaborative assessment and treatment of Australians with mental health problems. Representatives of the four professional bodies will present aspects of collaborative mental health care from each profession’s perspective and the impact it can have on mental health outcomes for people with mental illness. Allied Health Professions Australia (AHPA) is a collaboration of the national professional associations representing 14 organisations and 50,000 health professionals. Through AH, these professions have been working together for over 10 years to share information, increase awareness of their expertise and improve multidisciplinary teamwork, particularly for consumers with chronic health problems. AHPA has conducted several joint projects and advocacy for better access to allied health expertise for health consumers. The work of AHPA will be illustrated by the outcome of a project to educate general practitioners about allied health professionals’ skills and AHPA’s advocacy efforts to influence the current Australian health reforms.

Official Launch – A Global Special Issue on Psychology and Poverty Reduction: Accelerating input from the entire field of Applied Psychology

CARR, S. (Massey University), DALAL, A. (Allahabad University), MPOFU, E. (Sydney University), LOUIS, W. (University of Queensland), FRYER, D., MCCORMACK, C., DAVIDSON, G. (University of the Sunshine Coast), MARAI, L. (University of Papua New Guinea), BURT, C. (Canterbury University), WALDEGRAVE, C. (Family Centre Social Policy Research Unit)

In 2000 the United Nations signed up to the Millennium Development Goals to reduce poverty by 2015. To stimulate innovative effective and progressive contributions by psychologists to poverty reduction, twelve different peer-reviewed journals representing...
psychology from low-income, transition and OECD economies came together to collectively publish a coordinated Global Special Issue on Psychology and Poverty Reduction, with publication in mid 2010. This Panel at ICAP 2010 will debate the issues and officially launch the publications themselves (http://poverty.massey.ac.nz/). The Panel members and the journals they represent have these three key aims: (1) Summarise the project, including its key strengths & weaknesses; (2) Engage in accessible language through interactive discussion with an audience including development agencies and the media about intellectual, theoretical, methodological, political and ideological issues but most of all practical and policy issues in psychology applied to poverty reduction; (3) Explore, with each other and the audience, issues emerging from the project findings, their policy implications, and future applied directions. We are widely agreed that the project must not only inform theory, but mainly feed into policy and practice. Panel members’ on the issues to be discussed: A total of eight of the twelve participating journals will be represented directly at the conference, plus one coordinating chair. The eight journals are represented as appropriate by their Guest Special Issue Editor(s) &/or Editor(s), as follows: (1) Psychology and Developing Society, Professor Ajit Dalal, Allahabad University; (2) The Journal of Psychology in Africa, Professor Elias Mpofu, Sydney University; (3) The Australian Psychologist, Dr. Winnifred Louis, The University of Queensland; (4) The Australian Community Psychologist, Professor David Fryer (Unemployment and inequality researcher) and Mrs. Cathy McCormack (Grassroots community activist/campaigner in poverty reduction/social justice for 2 decades); (5) Journal of Pacific Rim Psychology, Emeritus Professor Graham Davidson, University of the Sunshine Coast/ Leo Marai, University of Papua New Guinea; (6) Journal of Managerial Psychology, Professor Chris Burt, Canterbury University; (7) New Zealand Journal of Psychology, Charles Waldegrave, the Family Centre Social Policy Research Unit, Wellington, New Zealand/Aotearoa; (8) International Journal of Psychology, Professor Stuart Carr, Massey University. Each journal also has extensive experience in the practice of development-related projects, in the community, workplace, education and a range of human services for example in health and wellbeing. All Contributors to the special issues are warmly invited to attend the session and contribute to the discussion.

Postgraduate training and accreditation: At the crossroads?

LITTLEFIELD, L. (Australian Psychological Society), VOUDOURIS, N. (Australian Psychological Society)

The Australian postgraduate professional psychology education and training landscape has, over the past 5 years, been through an unprecedented period of pressures for change, with significant reforms to the funding of the higher education sector still to come. As a result, tertiary professional training pathways have now reached a crossroads. Professor Littlefield will present an overview of Australian postgraduate education and training pathways for psychologists, including recent trends and likely future pressures and developments. Dr Nicholas Voudouris will present an overview of the Australian accreditation system for professional postgraduate courses and outline some of the challenges of an increasing emphasis on the assessment of competencies in the education of psychologists.

Psychological assessments, reporting and testimony in the family court: Protocols, best practice and dilemmas

This panel discussion will address best practice issues in psychological assessment for experts in the Family Court and other practitioners whose role it is to provide psychological evidence to the courts. The focus of the panel will be on providing a framework of best practice in aspects of psychological involvement with the courts. There will also be a focus on protocols for reporting, and a framework provided for the provision of testimony. Dilemmas associated with this complex area will be raised with practical solutions to these issues. The five
discussants individually and collectively have extensive experience as experts in the family court, present regularly on these issues and will address common dilemmas faced in this process of reporting to the family court.

**Psychologists in the media**

The experts reveal all – including some bloopers. Panellists will address the questions: Do I need training to work with the media? How do I ensure I give interesting, informed, and psychologically sound comment? How do I stop being railroaded by reporters and journalists? When is a story too flippant or controversial to be involved? When do I say no to an interview? When do I contact media people to make comment? How can I best promote psychology and the services it has to offer by using the media? What can I do if the media misquotes me? When/how should I ask to see a draft before okaying publication or the airing of my comments? The panel of experts include Amanda Gordon, former APS President and last Director of Communications and founder of National Psychology Week with over 12 years experience as media commentator, advice columnist and author, including ABC’s Latenight; psychologist and regular media personality Dr Michael Carr-Gregg, who has extensive experience in the media and is currently a regular on Neil Mitchell’s morning program on radio 3AW, Sunrise on Channel 7 and various print media; Grant Brecht, founding member of the Employees Assistance Professionals Association of Australia and the Australian representative on the Advisory Board for the Global Symposium for Mental Energy in the work-place, and a member of the Club of Geneva, based in Geneva, Switzerland; Dr Judy Kuriansky, United Nations representative for the International Association of Applied Psychology and the World Council for Psychotherapy, a pioneer of radio call-in advice and internet advice and former television reporter; and Associate Professor Terry Laidler, forensic psychologist, process facilitator and communications consultant, Chair of the Victorian Mental Health Reform Council and presenter on ABC radio for more than 10 years.

**Psychologists working in difficult settings: Immigration Detention Centres**

GORDON, A. (Private Practice), NEWMAN, L. (Royal Australian and New Zealand College of Psychiatrists), LIGHTFOOT, T. (Victorian Refugee Health Network), SINGLETON, G. (Royal Australian and New Zealand College of General Practitioners)

In 2010, Australia continues a policy of mandatory detention for all people who arrive in the country without a valid visa, prior to health and security checks. In its “New Directions” policy (dated 29 July 2008) the Government puts a strict limit on the term of detention, insisting that it be of the shortest possible duration, and that detention past the six months mark is subject to review and audit by the office of the Ombudsman. In the past decade, Government policies have led to systemic failures, whereby there have been cases of mistaken identity of those with a mental illness, misdiagnosis of mental illness and relabeling it as a ‘behaviour management problem’, and countless cases of detained asylum seekers having been traumatized, and having had their mental health compromised, as a result of prolonged detention. In 2006, stakeholders from the medical and psychological arena were brought together and agreed to form the Detainee Health Advisory Group (DeHAG) to the Federal Department of Immigration and Citizenship (then the Department of Immigration and Multicultural Affairs). Comprising representatives from the Australian Psychological Society, Australian Medical Association, Royal Australian College of Psychiatrists, Royal Australian College of General Practitioners, College of Nurses, Torture and Trauma Services and the Public Health Association, the DeHAG established itself as a committee of audit and review of Government policies to do with health in detention centres. Two working groups were formed: The Mental Health Subgroup and the Infectious Diseases Subgroup. In mid-2009, the Mental Health Working Group presented three Policy Frameworks to the DeHAG for endorsement: The Mental State Screening Policy; The Psychological Support Programme; and Support
for Victims of Torture and Trauma Policy. Rollout of these new policies throughout Australian Detention Centres began in February 2010, and continues. The policies reflect a significant cultural shift to the workings of Australian Detention Centres, demanding a Health Promotion, Prevention and Early Intervention approach. Case conferencing is key to ensuring that those in detention are provided with the least traumatizing experience while in detention, and a view of setting a low bar in the capture of those with histories of torture and trauma is facilitated. This panel will firstly explore the health of those in detention and discuss the policies and the training required for the roll-out and cultural change inherent in them. Secondly, the provision of services and promotion of mental health initiatives and early intervention in Australian Immigration Detention Centres and the political issues that can be obstacles to achievement of positive outcomes will be discussed.

Quality practice: Creating a measure of success (PPMS)

STOKES, D. (Australian Psychological Society), MATHEWS, R. (Australian Psychological Society)

In 2007, following wide consultation and a research trial, the APS developed the Private Practice Management Standards (PPMS). Supporting material was also developed including a self-assessment tool and resources for practitioners in private practice to evaluate and improve service provision. To date, over 2000 psychologists have completed the online self-assessment. The PPMS is currently being reviewed and updated in line with the many changes taking place in the Australian context. With the introduction of external practice accreditation for psychologists expected in the near future, and the development by the Australian Commission on Safety and Quality in Health Care of the National Safety and Quality Framework, the PPMS provides a foundation for an accreditation process. This workshop provides an overview of the PPMS, provides data to demonstrate psychologists’ areas of strength and weakness, and provides an opportunity for practitioners to complete sections of the PPMS as it applies to their practice along with discussion of resources and strategies to improve their practice management.

Screening, assessment and treatment of problem gambling: A research, clinical and client perspective

DOWLING, N. (University of Melbourne), CLARKE, J. (Gamblers Help (City)), JACKSON, A. (University of Melbourne), MCKENZIE, J. (Gamblers Help (City))

This panel presentation draws together expertise from problem gambling research and treatment specialists to provide an overview of best practice in the screening, assessment, and treatment of problem gambling. The panel proposes to discuss the recent models for problem gambling that have influenced the clinical formulation of problem gambling; the use and evidence for problem gambling screening and assessment instruments; early interventions and referral; the research evidence for psychological and pharmacological interventions; emerging interventions for problem gambling; and the limited evidence on which interventions work for whom. The panel also includes a previous client of a problem gambling treatment service who will provide a unique client perspective on the treatment of problem gambling. The panel discussion aims to provide an overview of screening, assessment and treatment of problem gambling from a research, clinical, and client perspective. Dr Nicki Dowling is a Senior Research Fellow in the Problem Gambling Research and Treatment Centre (PGRTC), Melbourne, Australia. She has been involved in gambling research for over 10 years and has widely disseminated research findings in journals, conferences, and professional development seminars. She has also been a problem gambling counselor at Gamblers Help City for 7 years and is an invited member of the Responsible Gambling Ministerial Advisory Council Research Working Party (Victorian Department of Justice). She is a registered psychologist, a member of the Australian Psychological Society, and a member of the Clinical College of the Australian Psychological Society. Ms Jodi Clarke has been a psychologist (problem gambling counselor) at one of the Victorian problem gambling treatment services (Gamblers Help City) for 9 years. She is currently delivering presentations on current best practice.
screening, assessment and early intervention for people with gambling problems for health providers within the City of Melbourne. She completed her Master of Health Psychology in 2002 and is a member of the Australian Psychological Society. Prof Alun Jackson is Director of the Problem Gambling Research and Treatment Centre at the University of Melbourne. The Centre has been established as a partnership between the University of Melbourne, Monash University and the Victorian Government to create an international centre for excellence in the field of problem gambling treatment and research. He had been involved in gambling research for over 10 years and has been involved in the design and direction of many large-scale gambling-related research programs. He is widely published in gambling research, is a member of the International Think Tank on Gambling Research, Policy and Practice, a member of the Victorian Independent Gambling Research Panel, and several Responsible Gambling Ministerial Advisory Council Working Parties (Victorian Department of Justice). Mr Jim McKenzie is a previous client of one of the Victorian problem gambling treatment services (Gamblers Help City) and has participated in the Spokesperson’s program at that service. This program was designed to train previous clients of the service to speak with media and deliver presentations about their gambling problems and their experiences of problem gambling counseling.

Societal development, peace and democratic governance: Topics of applied psychology

BOEHNKE, K. (Jacobs University Bremen), YAMAGUCHI, S. (University of Tokyo), BRETHERTON, D. (Australian Centre for Peace and Conflict Studies), ITO, T. (Wako University), KAGITCIBASI, C. (Koc University), BERRY, J. (Queens University)

Currently the International Association of Applied Psychology (IAAP) has two divisions that center around topics related to political issues: Division 3, "Psychology and Societal Development," formerly named "Psychology and National Development," and Division 11, "Political Psychology," which is largely devoted to Peace Psychology questions. Historically Division 3 has anti-colonialism roots, whereas Division 11 has its roots in peace activism. The aim of the panel is to discuss whether an organizational split into two divisions continues to be desirable in view of the necessity to strengthen the basis of applied psychology in the field of societal development, peace, and democratic governance. Panelists include officers of the two divisions, the current presidents (co-chairing the panel), and two international scientists of outstanding acclaim, Cigdem Kagitcibasi and John Berry, who have always been seen by the scientific community as engaged in applied psychological research of high political relevance.

Squalor and compulsive hoarding. What can the community and community services do?

STEKETEE, G. (Boston University), Frost, R. (Smith College), Kyrios, M. (Swinburne University of Technology)

Squalor and compulsive hoarding are associated with many challenges for community services, local councils, housing services, and health and mental health workers, as well as being linked to increased risk of fires, hygiene issues, and quality of life. Government policies for the management of risks and issues associated with squalor and hoarding are being developed, but models of intervention and skills sets for case workers remain poorly developed. The Panel/Symposium on Squalor and Compulsive Hoarding in the Community Context will consist of talks by 3 local experts: (a) Julie Harris [Community Ageing Strategist] from Metropolitan Fire Brigade; (b) Dr. Chris Mogan [clinical psychologist] from the Melbourne Clinic; and (c) Dr. Sook Mee Ling [psychiatrist] from Aged Care Services in Victoria. Discussion about strategies for managing squalor and hoarding in the community and for the dissemination of evidence-based approaches to such management will be led by two of the world’s foremost experts on compulsive hoarding, Professor Randy Frost (Harold & Elsa Israel Professor of Psychology, Smith College, USA) and Professor Gail Steketee (Dean, Department of Social Work, Boston University, USA). The session will be chaired by local expert Professor Michael Kyrios (Swinburne University).
Metropolitan Fire and Emergency Services Board - Hoarding and Squalor

Harris, J. (Metropolitan Fire and Emergency Services Board)

Metropolitan Fire and Emergency Services Board developed and supervised a study into hoarding related fire incidents and fatalities occurring over a ten year period. The aim was to identify common features including cause, demography and comparisons with other residential fires. This presentation will outline MFB’s emergency response experience in relation to hoarding and squalor. It will also include the results of the study and how this information has been unitised in the development of fire risk reduction advice for residential hoarding.

The psychology of compulsive hoarding

Mogan, C. (The Melbourne Anxiety Clinic)

Compulsive hoarding is an under-recognized yet complex and pervasive psychological problem that dominates sufferers’ time, living spaces, relationships and safety. Hoarding has been associated with a number of disorders, especially Obsessive-Compulsive Disorder (OCD), but it is not clear whether the presentation of hoarding phenomena differs across disorders. This paper will present (1) the phenomenology of compulsive hoarding, including its definition, etiology, age of onset, course, and (2) measures of severity, specific cognitions and behaviours, as well as (3) factors predictive of compulsive hoarding that emerged in recent research. The DSM-IV-TR (2000) currently fails to clearly distinguish compulsive hoarding with the only reference to hoarding being as one of eight diagnostic criteria for Obsessive Compulsive Personality Disorder, with no mention at all in the descriptions of Obsessive Compulsive Disorder. Hoarding and related phenomena was studied in 109 participants from 5 cohorts (hoarders with OCD, hoarders without OCD, OCD without hoarding, anxious and healthy controls). Results were consistent with previous findings, supporting the presence of hoarding symptoms across both clinical and non-clinical cohorts, and the clear differentiation of compulsive hoarders from clinical groups (OCD, anxiety) and normal controls. In general, findings supported the CBT model of compulsive hoarding and highlighted the need for ongoing research into this disabling psychological construct. Finally, the paper will discuss current treatment options, both individual and group-based, the importance of long-term treatment, assessment of individual context, and the therapy-interfering behaviours that impact both on the effectiveness of the interventions and the psychological health of the workers involved in hoarding.

Hoarding associated with squalor: Western Aged Care Assessment Service working model for field staff

Lee, S. M. (Western Health)

Patients with hoarding and squalor are increasingly referred to the Aged Care Assessment Services (ACAS). The responses can be variable depending on the individual assessors’ experience, knowledge and attitude towards the condition. This paper will present the working model at Western ACAS (WACAS). WACAS draws upon its multidisciplinary members in the assessments of these patients. When cognitive, physical or psychiatric illnesses are present, the person is referred for appropriate treatment. When an intervention is indicated in order for the person to remain in their home, WACAS undertakes the role of coordinating the intervention and obtaining the appropriate consent. For our patient cohort, time is usually limited due to competing pressures. The key to success lies in the accurate assessment of the patient, the environment and the task at hand. Pre-intervention planning is necessarily detailed and frontline staff are briefed prior to the intervention. During the clean-up, two WACAS staff are on-site in addition to the cleaners to troubleshoot unexpected events and provide counselling if required. WACAS performs a follow up visit and chairs a debriefing session for frontline staff prior to a formal handover to community service providers. The WACAS model was formed based on a combination of currently available evidence, experience and resources. WACAS has formed partnerships with non-government organisations in order to fund and
facilitate the intervention. The long-term feasibility of such partnerships is uncertain.

**Standards for Executive Coaching – The impossible becoming probable**

WHYTE, A. (Standards Australia), CAVANAGH, M. (Committee member Coaching Guideline Working Party MB-00906 - Standards Australia), ZARRIS, P. (Committee member Coaching Guideline Working Party MB-00906 - Standards Australia)

The Standards project is on schedule to produce a first draft for public comment in August this year. It is an exciting and remarkable project of interest locally and is being followed by colleagues in Canada, China, Europe, New Zealand, Singapore, South Africa, South America, the UK and USA. We will talk briefly about the areas addressed by the Guidelines: scope, definitions; context; types of coaching; coaching knowledge and competence; initial training, continuing professional development and supervision; the coach client relationship including confidentiality, assessment instruments, coaching within one’s expertise, referral and mental health; ethics; purchasing and contractual arrangements and evaluation. This session will provide you with a chance to talk about your expectations of such a Guideline and to raise issues. Working party members including Ann Whyte, Michael Cavanagh and Peter Zarris will be present to answer questions and share some of the learning journey that has kept the group engaged and motivated over the last year.

**Supporting health professionals to eliminate the use of restraint and seclusion in the disability sector**

LOVELOCK, H. (Australian Psychological Society), MATHEWS, R. (Australian Psychological Society), MCVILLY, K. (Deakin University), WEBBER, L. (Department of Human Services), TUCKER, M. (University of Queensland)

There is a long history of inappropriate use of restraint and seclusion with people with disabilities. Health professionals working in the disability sector would benefit from resources and training on interventions that have the scope to reduce or even eliminate the use of restrictive practices. The APS, in collaboration with experts in the disability field, has produced a set of guidelines to inform health professionals about principles and strategies for the utilisation of evidence-based psychological interventions to reduce the use of restraint and seclusion in the disability sector. These guidelines are applicable to a range of health professionals and have relevance across health care settings (e.g., aged care, forensic settings). The aim of this workshop is to provide strategies for applying these guidelines in practice. In particular, the workshop will focus on the development of a behaviour support plan based on a comprehensive functional behaviour assessment and analysis.

**The APS Reconciliation Action Plan**

MONTGOMERY, B. (Australian Psychological Society), DUDGEON, P. (University of Western Australia), GRIDLEY, H. (Australian Psychological Society), JONES, T. (Private Practice), HARNETT, P. (University of Queensland), RICH, B. (Private Practice)

One of the four planks of the APS Strategic Plan is to ‘actively contribute psychological knowledge for the promotion and enhancement of community wellbeing’, which involves ensuring that the public interest is always prominent in APS policy and decision making. Two years on from the Prime Minister's Apology to the Stolen Generations, and as part of its commitment to Indigenous health and wellbeing, the APS Board is working in partnership with the Australian Indigenous Psychologists Association (AIPA) to engage in a reconciliation process as an organisation. In initiating this partnership, AIPA suggested that the APS consult Reconciliation Australia as the peak national body building and promoting reconciliation between Indigenous and non-Indigenous Australians for the wellbeing of the nation. One of Reconciliation Australia's key strategies for achieving this goal is to support and encourage organisations to undertake a reconciliation action plan (RAP) – see http://www.reconciliation.org.au/home/reconciliation-action-plans. Two core principles for developing strong RAPs are recommended: (1) Ensure shared ownership across all levels of an organisation and involve as many people as
possible in the process; and (2) Indigenous collaboration – listening to and learning from Aboriginal and Torres Strait Islander people is an essential part of the process. This forum will take the form of a progress report on the development of the APS plan to date. Presenters will include spokespersons from AIPA, APS and Reconciliation Australia.

**The future definition of educational, instructional and school psychology: 2020 and beyond**

Various forces are impacting on practitioners in the field of Educational, Instructional & School Psychology which will define the future of this specialization. Within the Australian context legislative and regulatory processes are defining the profession. Again, in the Australian context Education Psychology is a specialty with Developmental Psychology whereas this association has been separated (if it ever was joined) in other parts of the globe. At the professional level Educational Psychology fits into the intersection of research, practice, leadership and management of two separate professions: education and psychology. In some countries this means that Educational Psychologists are consulting clinical specialists. In other settings they are working side-by-side with teachers and specialist educators. In other roles they are managers and bureaucrats. Correspondingly, training for the profession is very diverse with some countries requiring educational and psychological training to upper postgraduate levels. Given the diversity of the profession within and across different continents and national boundaries it is timely to consider what the future of Educational, Instructional and School Psychology might be and what will need to alter to allow for flexible development of the profession towards high standards of practice and training.

**Training in organizations: Policy issues**

HAKEL, M.D. (Bowling Green State University), KRAIGER, K. (Colorado State University), FRACCAROLI, F. (University of Trento), BARTRAM, D. (SHL Group Limited)

As part of the Alliance for Organizational Psychology’s White Paper series, the participants are writing a training review paper entitled: Training in Organizations: Policy Issues. The paper will provide a comprehensive review of training and development in organizations, as evident from the top international journals. This review will focus on providing insights, from the evidence, as to what matters when designing, delivering, evaluating and facilitating the transfer training and development activities in organizations. These insights, translated into bottom-line assertions, will be derived from studies that here show what makes a difference to individuals, teams, organizations, and societies. These conclusions can be used to inform researchers, practitioners, executives, policy-makers and any others, whose job is to design and deliver training and enhance the skill portfolio of the workforce. The authors will discuss their goals for the white paper with the audience. The white paper is in the early stages of development. Thus, the roundtable chair and participants will seek input from the audience about directions for the paper, ideas for policy statements, and recommendations for key studies to be included.

**Trauma makes good news – what clinicians need to know about the media**

MCMAHON, C. (Dart Centre for Journalism and Trauma-Australasia), KEATS, P. (Simon Fraser University, Surrey), INOUE, K. (Yokohama National University), TIPPET, G. (The Sunday Age), BATES, G. (Swinburne University)

Tragedy, disaster and violence are by and large the content of daily news. This panel brings together experts from a new field of scholarly enquiry, that of ‘journalism and trauma’. Few clinical studies have been undertaken in this area; however experts from Canada, Japan and Australia will present findings from research regarding the occupational hazards of work related trauma exposure on a forgotten group of ‘trauma responders’ – the media profession. Clinical suggestions when meeting with news
gatherers as patients, as well how to assist trauma survivors who have been ‘covered’ by the media will also be discussed. The panel will also discuss managerial impact on trauma exposed staff. This panel is about how to work collaboratively with journalists as professional equals and not a ‘managing the media’ presentation. It will be of interest to both academic researchers and those working in clinical practice. The panel discussion will introduce cutting edge research of a new, cross discipline area of enquiry from three international perspectives, create awareness into the specific needs of media professionals in the counselling room, and apply metaphors to assist the therapeutic process with journalists and photographers. It will discuss skills in assisting families and children who have been the subject of news stories, or wish to tell their stories via the media, and the panel aims to educate in being a better ‘source’ for journalists in regard to mental health issues for the broader community. There will also be an opportunity to enter into dialogue with clinical researchers and a working journalist about issues pertaining to news, trauma exposure and survivors covered by the media. Each of the researchers have undertaken novel research within their own countries and published groundbreaking papers on trauma and journalism from the above perspectives. They are part of a small band of international experts in this area. The award winning working journalist to present has undergone international education on the impact of trauma as it relates to the media profession and ethical coverage of trauma in society.

**Trends in leadership development: How well are psychologists contributing to developing leaders for a complex future?**

CAVANAGH, M. (University of Sydney), GREIF, S. (Institute of Business Psychological Research and Counseling, Osnabruück), LANE, D. (Middlesex University, London), STOUT ROSTRON, S. (Coaching and Mentoring Association of South Africa (Comensa)), ATKINS, P. (Australian National University), O’CONNOR, S. (Sydney University)

This panel discussion will focus on the contribution of psychology to leadership development. The discussion will focus on the nature of organisational demands in the twenty-first century as the context for which leaders need to be developed. The panel will suggest that while current models and methods of leadership development have many benefits, they tend to focus on building individual level skills grounded in the belief that the leaders primary task is to ensure specific outcomes. Rather, we suggest that leadership development needs to focus on the leader’s capacity to work at meta-systematic levels, as a participant in the self-organizing emergence characteristics of complex adaptive systems. Such a concept of leadership has important consequences for models of leadership, and methods of leadership development. In particular it highlights the role of developmental psychology in understanding leader development, and suggests a greater emphasis needs to be given to process and iterative reflection based methods of leadership development such as coaching, mindfulness, and reflective practice. These iterative methods of reflection enable leaders to remain engaged with the complex changing conversations that make up today’s leadership context. The aims of the panel discussion are to stimulate thinking and discussion about this critical area of applied psychology, to identify the positive and ongoing contribution made to leadership development by psychology, and to identify areas of future research and applied focus in leadership development. The panel is made up of world acknowledged experts in the area of executive coaching and leadership development and research.

**What editors want: Do’s and don’ts for submitting your manuscript**

ROBERTSON, M. (Wiley-Blackwell Asia-Pacific), CROWE, S. (LaTrobe University), RAPEE, R. (Macquarie University), SCHWARZER, R. (Freie Universität Berlin)

Have you ever wondered what editors look for when combing through droves of manuscript submissions? Just how do you get your manuscript to the top of the pile? In this session participants will learn what editors look for when deciding which articles get considered for publication. Panel members will discuss how to avoid common mistakes when writing and submitting papers for publication. They will also
give hints and tips about topics like how to write a good abstract, citations, and more. In addition, speakers will discuss current publishing trends and publishing biases. A question and answer session will follow the presentations; presentations will be kept short in order to allow plenty of time for lively discussion. This session is aimed at students, post-docs, and early-career psychology researchers, but attendance is open to all.

What's your policy on that? The importance of developing a school psychology service policy

THIELKING, M. (Australian Psychological Society), TINNEY, F. (Australian Psychological Society)

School psychology is recognised as one of the more ethically challenging areas in psychological practice. This can be attributed to the multifaceted nature of activities that make up the role of school psychologists coupled with the complex range of student issues that require psychological intervention. Furthermore, there are a number of stakeholders in a school setting who also have a duty of care towards students, and who the psychologist must work and consult with on a regular basis. Professional boundaries, client consent and access to records must be carefully managed by school psychologists. An individualised policy, which clearly defines the principles behind a school’s psychological service, is a vital tool in defining this unique area of practice, promoting whole school understanding of the service and highlighting the professional responsibilities associated with working as a psychologist in a school setting. This workshop will present participants with a brief overview of the challenges often faced by psychologists working in a school setting. In particular it will emphasise the importance of school psychologists working with their employers on developing a school psychological service policy. Participants will be provided with much opportunity to discuss key ideas and will be assisted in developing a framework for their own school psychological service policy. This workshop will be particularly useful to school-employed psychologists, although presented concepts may be generalised to more systemic settings or to psychologists working in multiple settings.
A fair and impartial jury:
Advances in measuring and moderating pre-existing juror biases

Chair(s): REES, N. (Victorian Law Reform Commission)
Discussant(s): REES, N. (Victorian Law Reform Commission)

The right of a defendant to a fair hearing is a fundamental common law right in Australia. Throughout the conduct of a jury trial, a number of available legal procedures can be invoked in an effort to ensure that juror biases are minimized and that the empanelled jury renders a fair and impartial verdict. These mechanisms include the exercise of peremptory challenges or challenges for cause, the admission of educative evidence from expert witnesses to assist jurors in understanding the facts in controversy, and the issuance of jury directions during and at the close of the trial. However, these procedures presume that pre-existing juror biases are easily discerned, and second, that they can be cured by these means. Drawing on an array of psychological experimental methods, each of these papers explores the nature of a specific potential pre-existing jury bias. These findings shed light on the effectiveness of one or more legal procedures to minimize their influence. The implications for policy reform and practice are reviewed by a distinguished discussant.

Jury-eligible citizens’ mental models of negligence resulting in personal injury

SHANAHAN, C. (Air Operations Division DSTO)

Considerable research demonstrates that people possess experience-based knowledge structures of crimes that influence the manner in which information is processed at trial, but little research exists on mental models of civil law concepts. The broad aim of this study was to apply a prototype methodology to examine the nature of jury-eligible citizens’ mental models of negligence resulting in personal injury. The specific aim was to determine whether mental models of cases that end successfully for the plaintiff differ systematically from those that end unsuccessfully, particularly with regard to the severity of the plaintiff’s injuries. A sample of 74 jury-eligible Australian citizens provided a description of a typical case in which a plaintiff sues a defendant for negligently causing an injury. Participants were randomly allocated to one of two conditions: cases that ended either successfully or unsuccessfully for the plaintiff. Participants’ stories were coded on the principal legal elements of the tort of negligence, and on the severity of the plaintiff’s injuries. The prototypical mental model extracted from participants’ negligence stories provided a close match with the principal elements of the law of negligence, and mental models of cases in which the plaintiff was unsuccessful differed meaningfully from those in which the plaintiff was successful. However, few of the stories generated by individual participants referred to all of the relevant legal elements. Furthermore, participants asked to describe a personal injury case that ended successfully for the plaintiff were more likely to recount a story that involved a more severely injured plaintiff. The findings suggest that jurors deciding negligence cases may benefit from more explicit guidance to ensure that all the appropriate legal elements are considered. More significantly, they suggest that a juror confronted with a case involving a severely injured plaintiff may be predisposed to interpret the evidence presented at trial in a manner consistent with a successful outcome for the plaintiff. Further research is needed to examine the extent to which people’s naive representations of negligence cases influence decisions of liability, and the extent to which these representations are susceptible to modification.

Keywords: experience-based knowledge structures, negligence, information processing, trial, personal injury

CSI effects in DNA cases: expectations and outcomes
GOODMAN-DELAHUNTY, J, (Charles Sturt University)

Perceptions that DNA evidence is irrefutable in identifying a perpetrator are reinforced by its portrayal in popular television programs such as CSI: Crime Scene Investigation as reliable and definitive. Judges, lawyers and forensic scientists expressed concern that Australian juries are susceptible to CSI effects and perceive DNA profiling evidence as more definitive than it is in reality. Past studies produced mixed results: some showed CSI viewing increased scepticism of forensic evidence; others indicated that juror expectations were affected by CSI exposure, but not their verdicts. A sample of 470 jury eligible citizens viewed an online simulated homicide case lasting 35 minutes in which a forensic scientist presented evidence of an incriminating DNA match between the suspect and a crime-scene sample. The expert testimony was oral or accompanied by multimedia; a control group received no expert evidence. A pretest-posttest design assessed mock-jurors’ DNA knowledge before and after the trial. Mock jurors reported their CSI viewing habits, rated the realism of CSI-type TV shows, answered multiple-choice questions about DNA profiling, and rendered individual verdicts. Approximately half the mock-jurors were frequent CSI viewers, watching the show most weeks. High perceived realism of the shows was associated with less receptivity to forensic evidence. Frequent CSI viewers placed more trust in science, were more sympathetic to the crime victim, applied a more stringent threshold of proof, were more likely to misinterpret the random match probability, were more confident in their verdicts and were more motivated to serve on juries. Mock jurors were most susceptible to the CSI effect when expert evidence was presented orally without visual aids. CSI viewing impaired jurors’ use of the relevant evidence but had no significant effect on case outcomes. Although the mean educational level of more frequent CSI viewers was lower that that of infrequent viewers, when education level was held constant, frequent viewers who regarded the CSI shows as realistic demonstrated a lower level of DNA knowledge and learned significantly less than infrequent CSI viewers.

Keywords: expert evidence, Crime Scene Investigation, forensic evidence, juror expectations, verdict

Cognitive misers or optimizers: Juror reliance on stereotypes

MCKIMMIE, B. (University of Queensland)

To date, research has suggested that mock jurors typically use stereotypes as a ready decision-rule to help arrive at a verdict. As a consequence, counter-stereotypical defendants in the criminal justice system, such as women, are often observed to receive preferential treatment because they do not match perceivers’ expectations about offenders. A series of mock jury studies were conducted. These studies involved a range of simulation techniques including written trial summaries accompanied by items of evidence, video trial recreations, and deliberating groups. For the video material, a mock trial was filmed with multiple cameras in a moot court room and presented via three aligned and linked video projectors. Student and community participants completed questionnaires, had their eye gaze recorded when presented with video, and had the content of their deliberations video recorded. Study 1 found that being counter-stereotypical meant mock jurors were less sensitive to the strength of the evidence against the defendant. Study 2 found that mock jurors had poorer memory for case information but better identification accuracy when the defendant was stereotypical. Study 3 found that individuating information had a greater influence on mock jurors’ judgments about counter-stereotypical defendants. Study 4 found that mock jurors spent more time looking at counter-stereotypical defendants. Study 5 found further support for the notion that mock jurors focus more on the evidence for stereotypical defendants, even during deliberation. These studies as a whole suggest that the relationship between the use of stereotypes and mock jurors’ evaluations of defendants is more complex than previously suggested. Rather than being cognitive misers, mock jurors appear to be cognitive optimisers who use stereotypes to extract the as much information as is possible about a case.
Keywords: stereotypes, decision making, criminal justice system, cognitive misers, cognitive optimisers

Expert evidence and judicial directions: moderating misconceptions in a child sexual abuse trial

O’BRIEN, K. (Monash University)

Past investigations have produced mixed results on the influence of expert evidence and judicial directions on jury verdicts and assessments of the credibility of a child sexual assault (CSA) complainant. Using repeated measures, this study tested the effectiveness of two types of expert evidence and the timing of judicial directions in challenging common misconceptions about children’s memory and responses to sexual abuse. First, 118 mock-jurors completed a 20-item CSA Misconception Questionnaire. Approximately 10 days later, they served as virtual jurors in a simulated criminal CSA trial in which specialized CSA knowledge was provided by an expert or via judicial directions. Expert evidence had two levels: diagnostic clinical evidence vs social framework educative evidence. Timing of judicial instructions had two levels: directions presented before the child witness testified vs during the judge’s summing up. In a fifth trial condition, no specialized CSA information was included. Mock-jurors read a transcript of approximately 20 pages, assessed witness credibility, rendered verdicts and again completed the CSA misconceptions questionnaire. All four interventions significantly increased juror CSA knowledge. The more participants learned about CSA, the more likely they were to convict. Conviction rates were significantly higher in response to a judicial instruction received during the trial summation and in response to expert testimony from a clinical psychologist. Victim credibility fully mediated the effect of CSA knowledge on verdict: information about CSA presented via judicial directions or expert testimony enhanced perceptions of victim credibility, which in turn increased convictions. These results are promising for courts and policy-makers grappling with low conviction rates in CSA jury trials.
A military occupational model of mental health and psychology in the Australian Defence Force

Chair(s): HODSON, S. (Australian Department of Defence)

In 2008, the Australian Government commissioned Professor David Dunt from Melbourne University to conduct a review of mental health care in the Australian Defence Force (ADF) and transition to non-military life. The purpose of the review was to independently assess and benchmark, from mental health best practice and administrative perspectives, the current models of mental health support in the ADF, and the mechanisms of transition for those medically discharged with a mental health condition. Professor Dunt submitted his final report to the Ministers on 4 February 2009 and the report was released to the public on 1 May 2009. In his report, Professor Dunt noted that the ADF Mental Health Strategy compares favourably to the strategies of other military forces, and that the development of the strategy was “far-sighted”. He noted a commitment to the development and improvement of mental health services within Defence. However, Professor Dunt also identified areas for improvement and enhancement leading to 52 recommendations. Defence is currently implementing a comprehensive plan to address the Dunt Review recommendations that focuses on ten major goals, with the primary focus on enhancing the mental health workforce to improve pre and post operational support to ADF members. This symposium will explore the military occupational model of mental health and psychology services being utilised to redevelop support for the ADF, including a greater role for psychologists in multi-disciplinary mental health teams. The key learning objectives of this symposium are: (1) Understand how a military occupational model is being applied to mental health and psychology services in the ADF and understand the combination of prevention, early detection and intervention and treatment services being applied to reduce the impact of mental health problems and illnesses in the ADF; (2) Understand population risks and resilience associated with military service and particularly operational deployment; (3) Understand the role of cognitive behavioral training as a preventive strategy and a means of enhancing psychological resilience; (4) Understand barriers to mental health care in the ADF; (5) Explore case examples to enhance understanding of the points above.

Factors associated with psychological adjustment following operational service: the impact of 8 month deployments in the ADF

BENASSI, H. (Australian Department of Defence)

As the rate of Australian Defence contributions to international conflicts and peacekeeping efforts continues to increase, the Australian Defence Force is debating the impact of longer and multiple deployments on personnel and their families. In this study, the researchers aim to identify risk factors associated with poor psychological adjustment in Australian Defence Force personnel following operational service. In particular, it is predicted that the length of respite period between deployments moderates the relationship between length of deployment and mental health outcomes. That is shorter respite periods heighten the level of cognitive or emotional load and increases the propensity for poor mental health outcomes. A pseudo-experimental cohort design will be used with 3 cohorts (4 month, 6 month and 8 month deployments). Analysis will be conducted on post-deployment psychological screening data collected immediately post-deployment and again three to six months later. Researchers measure the predictor variable (respite period) on return to Australia, in prediction of mental health outcomes (psychological distress, posttraumatic stress and alcohol use) six months post-deployment. Researchers also intend to look at other possible moderating factors such as traumatic and non-traumatic stressors, and nature of operational service (e.g. peace enforcement or peacekeeping). Although data is still undergoing analysis, preliminary results indicate that risks

**ADF resilience training: The evaluation of a new ADF resilience training Initiative**

CRANE, M. (Australian Department of Defence), COHN, A. (Australian Department of Defence), HODSON, S. (Australian Department of Defence), WREN, C. (Australian Department of Defence)

In this study, the researchers examined the effectiveness of a two hour resilience training program. The program is designed to enhance coping flexibility, mental health literacy and psychological adjustment in military personnel within the Australian Defence Force. The BattleSMART (Self-Management and Resilience Training) program is based on Cognitive-Behavioural principles and emerged from a coping skills training intervention initially implemented at the Army Recruit Training Centre (ARTC), Kapooka. Research by Cohn and Pakenham (2008), conducted at ARTC indicated that the coping skills training was effective in enhancing psychological adjustment, and reducing maladaptive avoidant coping strategies. Two-hundred and seventeen Defence Force School of Signals (DFSS) trainees were given the BattleSMART program just prior to a period of increased academic stress. A longitudinal study design was used to evaluate the efficacy of the program. Twelve cohorts of trainees were measured on three occasions: (1) just prior to receiving the BattleSMART program, (2) immediately after receiving the program, and (3) three-months after receiving the program. Several measures were taken at each of these time points relating to mental health literacy, psychological well-being, coping flexibility and resilience. A repeated measures analysis was conducted examining whether satisfaction with training and the reported intention to use the training was related to changes in the critical outcome variables. Although data is still undergoing collection, preliminary analysis indicates marginally significant improvement in coping flexibility and psychological resilience at three-months, along with a significant reduction in sleeping problems and a significant improvement in the reported confidence of trainees to assist other trainees. The findings support the potential of cognitive behavioural training as a preventive strategy and a means of enhancing psychological resilience.

**Early intervention, stigma and barriers to care in the ADF**

MCINNES, M. (Australian Department of Defence)

The aim of this paper is to outline the stigma and barriers to care to mental health support in the ADF military and then to discuss how the Mental Health Reform process is addressing these issues. This paper will describe the changes to mental health support and services for ADF members that aim to decrease the incidence of mental health problems and better support those individuals who do develop mental health problems. As in most countries, in Australia stigma and barriers to care impact on those seeking help for mental health problems. Often there are negative stereotypes which apply to individuals with mental health problems, which in turn may lead to self stigma, that is the internalization of how the general public portrays people with mental illness and the belief in that portrayal. In the military, studies show that veterans report significant stigma and barriers to care in receiving mental health support. Mental Health Reform Process: With funding of $83M over the next four years, the ADF will address stigma and barriers to care for those with identified mental health problems. Ways of addressing stigma and barriers to care include ensuring support options are easily understood; that there is sufficient time in a busy work schedule to access these services; that there is easy access to these services when required; and that accessing mental health services will not in itself impact adversely on career aspirations. The initial priority is improving access to care, with a 50% increase in mental health professionals in local service delivery around Australia; by creating an ADF Centre for Mental Health to develop
tele-psychiatry services, improve training and services for sub clinical cases; by creating eight Regional Mental Health Teams to better manage complex cases and training; and by increasing staff at the strategic level to review and develop policy and training resources. Increasing mental health literacy to encourage individuals to discuss mental health problems with others is another important strategy, which is addressed in resilience training through the idea of assisting mates. The Mental Health Reform program in the ADF is addressing stigma and barriers to care in mental health, including developing easier access to mental health support at all levels, with more mental health professionals in each region delivering more comprehensive services.

Keywords: military, early intervention, stigma, care

Case studies in the application of the Military Occupational Model of Mental Health and Psychology within the Australian Defence Organisation (ADO)

ORME, G. (Australian Department of Defence)

To illustrate key elements and salient outcomes of the Military Occupational Model of Mental Health and Psychology through presentation of case studies from the Australian Defence Organisation (ADO). Presentation of actual (de-identified) case studies from the Australian Defence Organisation (ADO). which follow the Military Occupational Model of Mental Health and Psychology sequentially from incident/injury through rehabilitation and recovery and return to optimal functioning; including return to duties. The outcomes and key results for a small number of case studies will be presented which inform, validate and highlight the Military Occupational Model of Mental Health and Psychology an its application within the Australian Defence Organisation (ADO). Both qualitative and quantitative data will be presented. Through the successful application of the Military Occupational Model of Mental Health and Psychology, the case studies presented will demonstrate major outcomes which have been achieved with the Australian Defence Organisation (ADO). The elements of practical application of the model, as well as some areas for enhancement, will be discussed.

A relational perspective of career development

Chair(s): LEUNG, S. (Department of Educational Psychology, The Chinese University of Hong Kong)
Discussant(s): LEUNG, S. (Department of Educational Psychology, The Chinese University of Hong Kong)

A number of scholars in vocational psychology (e.g., Richardson, 1996; Whiston & Keller, 2004) suggested that vocational psychology should pay more attention to theoretical and research work that focus on the interface between work and relationship. For example, Blustein (2001) pointed out that “one of the most important and relevant contextual factors is that working is inherently social for most people” (pp.180-181). Given the primacy of social relations in Chinese communities, it is critical for research studies to include relational variables in their conceptualization so that the interface between work and relationship could be more clearly understood. This symposium aimed to achieve three different objectives. First, the presentations consisted of literature review and research studies that aimed to understand the impact of specific relational variables on career development. These variables included parental influence, parental career expectations, social support, filial piety, and psychological separations from parents. We hope that as a whole, this symposium could address the influence of these variables and advance our understanding on how they impact career choice and development. Second, all the presentations in this symposium addressed culture as a core contextual backdrop where relational variables derived their meanings. Third, we hope that the presenters could identity future directions to conceptualize the pathways of relational influences to guide research work, as well as practice implications to enlighten counseling professionals.

Parental influence on career development: An identity perspective

LI, X. (Department of Educational Psychology, The Chinese University of Hong Kong)

Among the literature related to factors affecting career development of young adults, parental influence and personal identity formation are two important perspectives that have been studied extensively (see Brown, Glastetter-Fender, & Shelton, 2000; Guerra & Braungart-Rieker, 1999; Lease & Dahlbeck, 2009; Scott, & Church, 2001; Wolfe & Betz, 2004). There were, however, few studies that aim to examine how identity development mediates the relationship between familial influence and career development. In this presentation, we want to review the career development literature that sought to understand the how family and personal identity development influenced career choice and development. Through this review of the international literature, we would like to speculate on the interactive effects of family influence and identity formation on the career development of young adults, and to propose future research direction and practice implications. The literature in the past twenty years (1980-2010) is reviewed with data-base including “PsycINFO”, “PsycArticles”, “Journal of Career Development”, “Journal of Career Assessment”, “Career Development Quarterly”, “Journal of Vocational Behavior”, and “Career Development International”. The key words focus on “parental + identity + career”. The alternative words for “parental” include “familial”, “family”, “parents”; for “identity” include “moratorium”, “foreclosure”, “achievement”, and “diffusion”; for “career” include “job”, “vocation”, and “vocational”. Family support, types of parenting styles, and different status of identity formation have intertwined impact on career planning, exploring, locus of control, career self-efficacy, decision-making and career commitment. Several demographic variables are also involved in this process, such as family social economics status, the year of students separate from parents. Key themes from the literature, including research and practice implications will be discussed. Findings tended to suggest that parents influenced the identity formation of young adults, and through that, they influenced their career development. Parental influence has a direct as well as indirect effect on the career choice of
Abstracts of the 27th International Congress of Applied Psychology

A social support perspective of career choice and development

ZHOU, S. (Department of Educational Psychology, The Chinese University of Hong Kong)

In recent career development studies, relational supports have been found to play an important role in individuals’ career development (e.g. Keller & Whiston, 2008; Nota, Ferrari, Solberg & Soresi, 2007; Gushue & Whitson, 2006). Even though “support” was considered as a multidimensional concept (Schultheiss, 2001), up to now, no literature review was done to analyze and synthesize different aspects of support and their effects on individuals’ career development. The literature aims to fill this important gap. Articles were searched from PsycINFO, Psychology: A SAGE Full-Text Collection and ProQuest 5000 data bases with key words “support” + “career” in article title and abstract. 62 articles were identified. The types of supports and the effects of different kinds of supports were categorized. Support came from four main sources: parents, peers, teachers and siblings. Support could be categorized with three methods: a. general support vs. career-specific support, b. active support vs. non-active support, c. content of support, which includes (a) emotion and self-esteem support, (b) offering information, alternatives, suggestions, and tangible assistant, (c) confirm individuals’ own decision, choice, dreams and plans, (d) accessibility, and (e) role modeling. The salience of sources and types of support varied across different groups of people. For example, peer and sibling support (such as to confirm individuals’ decision, choice, dreams and plans) was important for low SES adolescence (Ali, McWhirter & Chronister, 2005), parents and teachers’ emotional support was important for minority students (Kenny & Bledsoe, 2005), and parents’ emotion support was important for female students, but role modeling support was important for male students (Alliman-Brissett, Turner & Skovholt, 2004). Social support is definitely a multidimensional construct. In order to offer on-target career related support, one must offer the specific types of support that the person is needed and observe the target person’s response and reactions. In the presentation, we will summarize the main themes from the literature and discuss research and practice implications.

Keywords: social support, career choice, career development, role modeling, minority groups

Parental influence on career development of university students: A filial piety perspective

CHEN, S. (School of psychology, Beijing Normal University), HON, S. (The Chinese University of Hong Kong)

Filial piety has been identified as an important culture-related variable that influenced the career development of Asian individuals (Kwan, 1999; Leung & Chen, 2009; Yeh & Bedford, 2002, 2004). However, up to now, very few research studies have examined the salience of filial piety on career choice and development. In order to fill this research gap, this study used a qualitative design to understand how filial piety influenced the career development of Chinese students studying at a Hong Kong university. A total of 20 university students including 10 students from Chinese Mainland cities and 10 Hong Kong students were interviewed. The students participated in a semi-structured interview and responded to questions on how their relationship with their parents had influenced their career and educational choices. Each semi-structured interview lasted about 1 hour. The interview questions will be presented at the symposium. A number of key themes were identified, including: loyalty to parents, need for reciprocity, parental expectations on specific career choices, support, prestige and social status, and the balance between self and family needs. The divergent and convergent themes identified from Mainland Chinese and Hong Kong students will be discussed. Future research and practice implications will be discussed. This study identified some specific ways that filial piety considerations influenced the career choice development of Chinese students.
university students. The findings and implications supported the notion that qualitative research methods are useful in identify specific relational influences on career development, especially from a cultural perspective (Blustein, 2001).

Keywords: filial piety, career development, career choice, parental influence

The impact of parental career expectation and psychological separation on career-decision-making difficulties

CHEN, S. (School of psychology, Beijing Normal University), HOU, Z. (School of psychology, Beijing Normal University)

In China, the influence of collectivist culture is far-reaching, and the bond between individual and family has been highly valued (Hwang, 2009; Yang, 1996). Even for adults, the impact of family is still very important (Leung & Chen, 2009). Grounded on the Chinese cultural context, the study aimed to explore the contribution of parental career expectation, psychological separation from parents on young adult’s career decision making difficulties. The participants were senior-level college students who were studying at a number of major universities in the Chinese Mainland. They were administered a newly developed Parental Career Expectation Scale, a measure on psychological separation, and the Career Decision-Making Difficulties (Osipow & Gati, 1998). Students were given a short explanation on the purposes of this study and they participated voluntarily. The Parental Career Expectation Scale (PCES) was developed to measure the career expectation of students. In the presentation, we will present the psychometric properties of the instrument so that the reliability and validity of the instrument could be assessed. We investigated the predicting effect of parental expectation on career decision making difficulties, and how dis-congruence between parents’ expectation and the individual’s on career choice might contribute to decision making difficulties. We examined the impact of psychological separation from parents on the career decision making. A mediation and a moderation model would be compared. The effects of the global and components of psychological separation would be examined. It was hypothesized that the Conflicting Independence component of psychological separation would be the best predictor of career decision making difficulties. The findings will be discussed in terms of future research direction and career counseling practice. We hope the findings will contribute to the development of (a) a good measure of parental career expectation that is now absent in the literature, and (b) a conceptual model for researchers to further examine how family and parents influenced the career choice of students in Chinese communities.

Keywords: parental career expectation, separation from parents, career decision-making, young people, career counselling
Addressing the challenges of cross-disciplinary and collaborative work for environmental psychologists: The Australian context

Chair(s): HINE, D. W. (University of New England)

Environmental psychologists often find themselves working in cross-disciplinary teams. When engaging in collaborative research, team members bring their own unique set of worldviews, theories and methodologies, which are closely tied to their disciplinary background and training. This often produces a context in which researchers essentially work in parallel, each relying on his or her specific disciplinary expertise to address the research problem at hand. The output from these types of collaborations can be described as multidisciplinary given that frequently there is little integration or effective cross-talk between team members. This multidisciplinary approach can be contrasted with interdisciplinary research, in which a group of researchers adhere to their own discipline-specific paradigms, but work jointly to address a common research problem, and transdisciplinary research in which research teams generate new perspectives and insights that transcend traditional disciplinary boundaries. This symposium brings together leading environmental psychologists from across Australia to discuss the rewards and challenges associated with working in collaborative research teams, the relative merits of multidisciplinary, interdisciplinary, and transdisciplinary perspectives, and the implications for the future of environmental psychology.

Framing and researching the psychological in World Heritage Areas

RESER, J. (Griffith University; University of Queensland), BENTRUPPERBAUMER, J. (James Cook University)

The presentation addresses the role of psychology in the research, planning, and management of World Heritage Areas in the rainforests of Far North Queensland. Psychology and protected area management requires not only a bringing together of relevant theory, research and applied areas of psychology and social science (e.g., environmental perception, place attachment, restoration, leisure studies, natural and cultural heritage interpretation, behavioural design, crowding, risk management, and environmental impact assessment) but collaborating and communicating with natural scientists, resource managers, government bodies, the tourism industry, conservation groups, the catchment community, and national and international visitors. Environmental psychology has the reach and breadth and body of knowledge and research findings to make a substantial contribution in such protected area and natural and cultural heritage management contexts, but requires a thoughtful and transdisciplinary approach, and a strategic and informed framing of both the research and the discourse when working in this multi-disciplinary but rarely interdisciplinary space. The presenters provide a number of windows on managing and communicating their research and ‘management’ roles and status as environmental psychologists in the Wet Tropics along with addressing the people side of World Heritage Area management. Noteworthy challenges included an appropriate and ecological framing of a transactional approach, bringing the human landscape into the frame, designing a methodology which captures all visitors and ‘users’ of such landscapes and places, working through serious language and meaning fault lines, reframing restoration and ecosystem system services conceptualisations, designing for experiences and encounters, developing a psychosocial impact assessment framework and indicators, managing virtual environments and representations, and addressing ‘the role of the World Heritage Area in the life of the community’.

Keywords: World Heritage Areas, environmental psychology, landscapes

Finding the same wavelength: a learning journey in environmental management
ROSS, H. (University of Queensland)

If we accept that humankind depends on our local and global environments for all of Maslow’s needs, psychologists and all other social scientists need to learn collaboration with the entire suite of sciences, economics and humanities to help create resilient and sustainable societies. Meanwhile many environmental scientists recognize that managing environments is largely about managing people. I will share a journey in understanding and helping to manage people-environment relationships, from when my psychology met hydrology, flowed (with other ologists and onomists) through Australian, Asia and Pacific catchments, and now live happily on the same wavelength in Moreton Bay and the Great Barrier Reef. This journey highlights mental models, resilience, and social-ecological systems. I will share strategies for successful interdisciplinary collaboration, including focusing on the problems and not the disciplines, working through personal relationships, and developing shared constructs and frameworks.

Keywords: environmental scientists, people-environment relationships, hydrology, resilience, social-ecological systems

What has psychology got to do with managing a coral reef?

SYME, G. (CSIRO Wealth from Oceans Flagship), DZIDIC, P. (CSIRO Wealth from Oceans Flagship), FULTON, B. (CSIRO Wealth from Oceans Flagship)

The Ningaloo coral reef on Western Australia’s coast is the longest fringing coral reef in the world. Until recently demand for accessing it for fishing, tourism and recreation have been seen as manageable. But with the controversy surrounding a major tourism development and the rapid expansion of the oil and gas industry has led governments to invest heavily in research for the area. At last audit there were over 150 individual research projects and approximately 60 government and community agencies with a role in formulating and delivering policy and management. A major modeling effort has been attempted to integrate the perspectives of these multiple parties to encourage common perceptions and shared knowledge. As psychologists (Syme and Dzidic), we were brought into the research program with an eye to ensuring adoption of the model by key decision makers. This seemed a relatively simple task involving listening and interacting with people to ascertain their needs. Interaction with the modelers, other researchers, decision makers and the locals, however, soon proved otherwise. From the psychological perspective it became evident that there was a need to understand the cognitive limitations of all parties in terms of interpreting ecosystem models and how social networks affected the perceptions of the environmental problems and the ability to make coherent judgments both in regard to research and policy formulation. The modeler in turn (Fulton) describes what she imagined psychology and social science could offer to making her model relevant, where it was useful and where it was not in making the model more accessible and incorporating key behavioural insights. The psychologists and the modeler conclude with suggestions as to how to make their collaboration more effective in future.

Cross-disciplinary collaboration with research users: Making social research practical in Australian forestry

WILLIAMS, K. (University of Melbourne), DUNN, C. (University of Melbourne)

Forest management agencies (generally) seek to derive profit from forest products while maintaining a sustainable yield, adhering to environmental regulations, and maintaining a social license to carry out forest operations such as logging. In Australia, it is only in recent years that forest agencies, psychologists and other social scientists have collaborated to better understand social expectations regarding forest management. Undertaking social research in this competitive commercial context - with significant environmental and social consequences - has presented many challenges for all involved. In this presentation we reflect on the experience of researching attitudes to forest management over a nine-year period. We make specific reference to
PhD research undertaken by Caroline Dunn within the ‘Communities’ project of the Cooperative Research Centre for Forestry. Over a two-year period, interactions between researchers, and members of the project steering committee were explored to understand how these participants make practical meaning of social research outcomes in relation to forest management. There is not always ready agreement regarding the usefulness of studying public attitudes to forestry. While some forest agency staff welcome attitudes research as a means to better understand why people support or oppose forestry, some consider it a potential threat to company reputation or irrelevant to management decisions. Views are similarly diverse among social researchers, both within and outside of psychology. Some critique attitudes research, arguing that it reinforces unequal power relations between researchers/funders and the people under investigation, or that quantitative representation of results obscures complex meanings of forestry. We discuss these and other challenges and identify processes used to reach compatible, though not necessarily similar, understandings of the usefulness of attitude and broader social research. These include taking care to understand needs of all collaborators, providing detailed information about methods and methodological considerations, inviting feedback on research tools, identifying methods for data presentation that effectively communicate diversity of views, and reframing narratives of research findings to embrace diverse but aligned interpretations.

Adolescent health promotion

Chair(s): TOUMBOUROU, J. W. (Deakin University)

Discussant(s): RICCIARDELLI, L. (Deakin University; Chair APS College of Health Psychologists)

Relative to previous generations the time young people spend in education has gradually lengthened to extend the period known as adolescence that falls between childhood and the achievement of financial independence. The learning objective for this symposium is to increase knowledge of the current application of research and practice in health psychology to the prevention of a range of health compromising behaviours that emerge during adolescence. The adolescent health and social problems that form the outcomes examined in the four papers presented in this symposium are alcohol and tobacco use, physical inactivity and antisocial behaviour. A diverse set of strategies are used to address these outcomes including school-based parent education (Paper 1), community epidemiology (Paper 2), theory-based information dissemination (Paper 3) and peer intervention (Paper 4). The methodologies range from randomised trials (papers 1 & 3), multi-level modelling (Paper 2) and longitudinal trend observation (Paper 4). A paper by Toumbourou and colleagues will lead the symposium. This paper overviews a secondary school intervention designed to disseminate parent education in order to prevent adolescent alcohol use. The paper presents evaluation findings from an Australian secondary school trial. The second paper, by Associate Professor Adrian Kelly and colleagues, presents findings relevant to community-based tobacco prevention that emerge from a large community survey of Australian students proximal to the adolescent transition. The third paper by Professor Charles Abraham explores prospects for increasing adolescent physical activity through the dissemination of a theory-based leaflet. The final paper by Professor Steinebach and Ms Steinebach will evaluate the effects of the Positive Peer Culture (PPC) intervention that has been developed to target adolescents.
institutionalised due to antisocial behavioural problems.

**Random allocation to a family intervention in secondary school to reduce harmful adolescent alcohol use**

TOUMBOURO, J. W. (Deakin University), GREGG, E. (Monash University), SHORTT, A. L. (University of Melbourne), HUTCHINSON, D. M. (NDARC, University of NSW), SLAVIERO, T. M. (Swinburne University of Technology)

Substance use (alcohol, tobacco and other drug use) accounts for around 30% of deaths and a major proportion of disease burden for youth in developed nations. In Australia and many other nations, rates of adolescent alcohol misuse have escalated in recent years. Family and community factors including parental acceptance of adolescent alcohol use are potentially modifiable influences. This study aimed to use a cluster randomised trial to evaluate a universal “Resilient Families” intervention for its effect in preventing frequent and heavy alcohol use in early secondary school students. Secondary schools in Melbourne, Australia were approached and 24 consented (62% of approached), 12 were randomly assigned to be approached for the intervention and 12 monitored as controls. Students in intervention schools received a social relationship curriculum; their parents received a parent education handbook and invitations to attend parent education events outlining strategies to reduce adolescent alcohol misuse and related problems. Consent for three annual surveys was obtained for 2,539 students (56% of approached sample) with Wave 1 in 2004 (mean age 12.3 years). Data were included for all students participating in at least two of the three annual survey waves (N = 2,354, 93% of recruited sample). Main outcome measures in Wave 3 (2006; mean age 14.5 years) were ‘lifetime’ alcohol use (any alcohol consumption), ‘frequent’ (at least monthly) and ‘heavy’ use (five or more drinks in a session at least once in the prior fortnight). Multivariate logistic regression results averaged across 20 imputations assessed the intervention exposure effect, adjusting for school clustering and baseline measures. Relative to control schools, students exposed to the intervention showed non-significant reductions in lifetime alcohol use (Adjusted Odds Ratio [OR] 0.78, 95% Confidence Intervals [CI] 0.63 - 0.98) and significant reductions in frequent (OR 0.70, CI 0.57 - 0.87) and heavy alcohol use (OR 0.74, CI 0.59 - 0.94). Increasing parent education in early secondary school appears a feasible public health strategy for reducing frequent and heavy adolescent alcohol use.

**Keywords:** substance use, adolescent alcohol use, secondary school

**Multi-level and modifiable factors that underlie community variation in child tobacco use**

KELLY, A. B. (Centre for Youth Substance Abuse Research, University of Queensland), O’FLAHERTY, M. (University of Queensland), CONNOR, J. (Centre for Youth Substance Abuse Research, University of Queensland), HOMEL, R. (Griffith University), TOUMBOURO, J. W. (Deakin University), PATTON, G. C. (Centre for Adolescent Health, Murdoch Childrens Research Institute), WILLIAMS, J. (Centre for Adolescent Health, Murdoch Childrens Research Institute)

The aim of this study was to explore cross-sectional predictors of tobacco smoking that may assist prevention strategies addressing individuals within their social context. Despite considerable success in tobacco use prevention, a high proportion of young Australians initiate smoking. Using the Healthy Neighbourhoods dataset, this study tested a model of child smoking across community (n = 30) and school (n = 231) levels. Statistical local areas were randomly selected in the Australian States of Victoria, Queensland and Western Australia after stratification by SES and rurality. Student behaviour and risk and protective factors were measured by self-report for 6867 students in grades 6 and 8. Fixed and random effects at the community, school, and individual level in the prevalence of tobacco use are reported. Fixed effects were estimated for custody arrangements, school grade, school size, gender, the smoking status of key social influences (parents/siblings/peers), academic performance, commitment to school, perceived norms regarding substance use, belief in the moral order, involvement in binge drinking, and impulsivity/sensation seeking.
Abstracts of the 27th International Congress of Applied Psychology

Exploratory analyses of 2-way cross-level interactions between these univariate predictors were also conducted. There were significant random effects at both the school and community levels, supporting the need for a multi-level model. Individual level predictors accounted for a third of variance at the community level, but school level effects were not significantly changed by addition of community level predictors. The strongest effects were for number of friends who smoke, sibling smoking, binge drinking, and belief in moral order. Smaller significant effects were found for parent smoking (weaker effects for fathers), perceived norms, school commitment, and sensation seeking personality traits. The strongest effects were approximately 2-4 times the size of the smaller effects. In general interactions across levels of the model were non-significant. The majority of the between-school variation was accounted for by the characteristics of students attending each school and their social networks. The results point to the utility of targeting family and peer influences within identified communities, with a joint focus on alcohol and tobacco.

Testing leaflets designed to promote initiation of increased physical activity in schools

ABRAHAM, C. (University of Sussex), HILL, C. (Tower Hamlets Primary Health Care Trust), WRIGHT, D. B. (Florida International University)

The aim of this study was to design and test a theory-based leaflet that would result in increased physical activity among teenagers and could be easily implemented, used and sustained within classroom settings. A randomised control trial evaluated the effectiveness of a theory-based persuasive leaflet designed to encourage students to undertake at least one additional exercise session a week. Participants were 503 college students. The leaflet was written to target potentially-modifiable cognitive antecedents of exercise specified by the Theory of Planned Behaviour (TPB). It was separately augmented with two evidence-based cognitive change techniques, resulting in three intervention conditions, leaflet alone [L]; leaflet plus motivational quiz [LQ], and leaflet plus implementation intention prompt [LII], as well as a no-leaflet control condition (C). Cognitions and behaviour were measured immediately before and three weeks after intervention. The results showed that all three leaflet interventions (i.e., L, LQ & LII) significantly increased reported exercise, intention to exercise and TPB-specified cognitions, compared to the control condition, but did not differ in their impact. Mediation analysis showed that intervention effects on exercise were partially mediated by the impact of intervention conditions on intention and that intervention effects on intention were partly mediated effects on TPB-specified cognitions. The study provides an experimental support for the Theory of Planned Behaviour and for a practical, sustainable theory-based intervention for use in schools. The results demonstrate how cognitive theory can be applied in a cost effective way to behaviour change in classrooms. Further work is required to assess the impact of such interventions on exercise maintenance and to identify combinations of techniques that could boost the effectiveness of theory-based leaflets.

An evaluation of the effects of the Positive Peer Culture (PPC) intervention for adolescents with behavioural problems

STEINEBACH, C. (Zurich University of Applied Sciences), STEINEBACH, U. (Zurich University of Applied Sciences)

The concept of Positive Peer Culture (PPC) developed by Vorrath and Brendtro in the 1970s relies on the experience of being able to help. In focusing on mutual generosity PPC differs from other educational concepts. The current evaluation examines the impact of PPC on a range of youth development outcomes. The study aims to evaluate the effects of the Positive Peer Culture intervention on adolescents with behaviour problems. The
Analyses of perceptual-cognitive skill for optimal performance in sport: Current trends

Chair(s): MACMAHON, C. (Victoria University)
Discussant(s): RAAB, M. (German Sport University)

Sport provides an ideal domain for understanding human performance under complex demands. Similarly, psychological approaches and analyses of sport have granted insights into training and performance that have led to significant advancements. This symposium will illustrate the use of psychological approaches in sport research, tackling problems from talent selection and determinants of success, to performance factors, and influences in the decision making process. The presenters will show a variety of statistical and laboratory-based approaches for understanding expertise in sport, and the perceptual-cognitive components involved. With presenters that use differing approaches to understanding perceptual-motor performance, discussion will centre on the most current questions in expertise research, and future trends.

Using information technology for talent identification and strategy optimisation in cycling omnium races

ZELEZNIKOW, J. (Victoria University)

To use Information Technology to support talent identification of potential cyclists to compete in the newly introduced, to the 2012 Summer Olympic Games, cycling event the Omnium. We also wish to develop strategies for cyclists to optimize their performance (in terms of obtaining points) in both the men’s and women’s omnium. On December 17, 2009, the Union Cycliste International recommended to the International Olympic Committee a new track programme event for the Summer Olympic Games in London 2012. Recommendations are for it to consist of: flying lap (250-metre time trial); points race (men: 30 km, women: 20 km); individual pursuit (men: 4
km, women: 3 km); scratch race (men: 15 km, women: 10 km); Kilometre time trial (men), 500-metre time trial (women); elimination race (24 starters). We are using data mining techniques to analyse past performances in both individual and omnium events (admittedly previous omniums have consisted of five events over one day rather than the proposed six events over two days) to choose suitable candidates to compete in the Olympics. Probabilistic techniques are being used to optimize the performance (in terms of points) of cyclists in both the men’s and women’s omnium events. Comparisons are made to the choice of participants and their performance in the men’s decathlon and the women’s heptathlon in track and field events. The results, to be discussed at the conference, measure how various statistical and artificial intelligence techniques can help in talent identification of medal winning cyclists and improve their performance in omnium events. This work will draw conclusions on how to identify talent and optimize performance in cycling omnium events.

Seeding: A source of the home advantage in World Cup soccer?

STRAUSS, B. (University of Muenster)

The main purpose of the present study was to examine whether host nations receive an advantage in seeding (thereby competing against weaker teams) in the first rounds of the final competition of the Fédération Internationale de Football Association (FIFA) World Cup. A popular belief is that one of the economic factors to which the FIFA Organizing Committee is particularly sensitive is the success of the host nation in the first rounds. As a consequence, it is widely held that home teams are placed in a subgrouping with teams that have a relatively lower international ranking or strength among the qualifiers. A secondary purpose was to examine the extent of the home advantage in all games in the FIFA World Cup. A tertiary purpose was to examine the extent of host nation success in all games played between 1930 and 2006. Performance of the home teams was the result in each game from 1930 to 2006 with a win, tie, and loss coded as 2, 1, and 0 points, respectively. Seeding lists were obtained from the www.fifa.com website. The operational definition of the strength of each team was determined from the World Football ELO Ratings System (www.eloratings.net). Host nations have been competitors in a total of 103 games. Results showed that in comparison to visiting teams, host nations have a significantly superior ($p < .05$) ELO ranking in the earliest phase of the FIFA World Cup tournaments. The advantage resulting from seeding disappeared ($p > .05$) in subsequent phases of the tournament. The results also showed that host nations have substantial success, winning 66% of all games if tie competitions are included and 79% if they are not. Our results showed that there is a strong home advantage in FIFA World Cup Soccer and that the seeding protocol used by FIFA contributes to that advantage.

Decision making in tennis: Capturing the impact of situational probabilities on predicting an opponent’s intent

LOFFING, F. (University of Kassel, Institute of Sports and Sports Science)

The high ball speeds in racket sports and the latency of an athlete’s movement initiation in answer to an opponent’s action demand an athlete’s effective information-processing. For example, to be at the right place at the right time during a rally in tennis a player has to predict his opponent’s intentions based on early pre-shot information. Previous research in tennis showed experts’ superiority over novices in tasks that required the participants to anticipate shot direction or shot type without ball flight information available after racket-ball contact. These findings were predominantly interpreted in terms of experts’ more distinct capability to use advanced (visual) cues for action outcome anticipation. However, besides correctly interpreting an opponent’s kinematics, players also need to include the opponent’s as well as their own position on the court in their decision making
(Williams, 2009). Depending on these components the situational probabilities for future events (e.g., will the opposing player hit the ball to my left or right?) may alter significantly from one constellation to another. Although considered crucial in ball sports the impact of situational probabilities on decision-making has scarcely been examined so far (cf. Abernethy, Gill, Parks, & Packer, 2001, for a study in squash). We present a novel methodological approach to tackle this issue. By using point-light animations of players performing forehand ground strokes (e.g., Abernethy et al., 2001) we investigate the influence of situational probabilities on shot direction anticipation in tennis. We designed video simulations where the hitting player’s position as well as the observer’s viewing perspective (from behind the baseline in the opposite half of the performing player) were systematically manipulated; however, without altering any of the hitting players’ movement kinematics. In two laboratory-based experiments currently carried out on tennis players of varying expertise levels, participants are presented with these animations on a monitor (each clip is occluded at the moment the racket makes contact with the ball) and are asked to predict shot direction (left vs. right from the observer’s perspective). The exact experimental design and (preliminary) results will be presented at the conference.

Intuitive decision making of expert players in sports

RAAB, M. (German Sport University)

Intuition is often considered as an effective manner of decision making in sports. In this study we investigated if a preference for intuition over deliberation results in faster and better lab-based choices in team handball attack situations. We assume that intuitive choices—due to their affective nature—are faster when multiple options are to be considered and are effective if expertise can lead such intuitive choices. 54 male and female handball players of different expertise levels were tested in a lab-experiment, showing video-based scenarios in a team handball attack situation. An option-generation paradigm was used in which participants were requested to intuitively name an option for the playmaker in an ill-defined situation when the video stopped in a freeze frame. Decision-time was measured in milliseconds, and decision quality was evaluated through expert ratings. After the first intuitive option, they were asked to generate other appropriate options, and finally name the best option from all options generated. A preference for intuitive and deliberative decision making was assessed through the PID-Questionnaire. Results showed that athletes classified with a preference for intuitive decisions made faster and better decisions than athletes classified as deliberative decision makers. Importantly, expert players were more intuitive than near-expert and non-expert players. Results support a Take-The-First heuristic, defining how options are searched for, how option generation is stopped, and how an option is chosen. We conclude that expert players learn to use simple heuristics such as Take-The-First by relying on their intuition, and therefore produce faster and better decisions. The preference of intuitive and deliberative decision making seems to be an important moderator in sports, and it seems to be valid to develop implications for the testing and training of intuitive decision making in this area.

Applied implications of Mexican ethnopsychology

Chair(s): REYES LAGUNES, I. (National autonomous university of Mexico)
Discussant(s): SALAS-MENOTTI, I. (Santo Tomas University)

Since the time of the Spanish conquest, in Mexico there exist several documents in which we can find descriptions of the way Mexicans behave, like those of monks and some chronicles. But it is not until the end of last century that Ezequiel Chavez made serious attempts to describe, recognize and understand the way Mexicans are and behave. The interest in this task has been of the concern, among others, of philosophers, sociologists, historians, anthropologists, psychoanalysts, psychologists and writers. As it would be too extensive trying to make an exhaustive review of the various approaches just mentioned, we have chosen only three of them: the philosophical, ethnopsychological and the psychodynamic as it can be considered among the most relevant for the measurement of personality in Mexico. The pioneers of this concern to understand Mexican’s behavior were philosophers and we can find two fundamental tendencies. The first one represented, among others, by Alfonso Reyes, Jose Vasconcelos, Alfonso and Antonio Caso, which perspective is based on the idea that all philosophy is determined by the peculiar circumstances in which it occurs. The second tendency is represented by Leopoldo Zea who thinks that the main problem is trying to know the peculiarities of the Mexican in a universal context. It becomes very interesting that in both tendencies, the Mexican revolution is mentioned as the start point of the individualization and originality of Mexicans as well as its universality. The philosophical perspectives share the continuous highlighting of the negative aspects of the Mexican: Samuel Ramos refer to the Mexican as the Inventor of Artificial estinations (1951); having a deep feeling of minor value; as Iturriaga declared (1951), Uranga refers to a way of reluctance. Besides, it is not clear to what king of Mexicans they are talking about (region, social level, etc.). When Santiago Ramírez presented his book “The Mexican: the psychology of his motivations”, interest was aroused to interpret behavior from a new approach: psychodynamic. For him (1959), most of the perturbations of the Mexican nowadays are due to the crash of two cultures: indigenous and Spanish in which the first is subjugated by the second who is the dominant and strong that can be reflected even today in attitudes (malinchismo) as well in verbal expressions. The Mexican Ethnopsychology proposed by Diaz-Guerrero (1972, 1994, and 2003) is directed at identifying both the idiosyncratic or particular characteristics of the Mexican, as well as the general characteristics of human beings. In order to address indigenous character of a culture, he begins by defining socio-culture as a system of interrelated cultural premises that govern the feelings and ideas, and guide the interpersonal relations, stipulate the rolls that have to be carried out and the rules for the interaction of individuals for each role: that is to say, it specifies the where, when, with whom and how to behave. In order to operationalize socio-culture, Diaz-Guerrero (1955; 1963; 1967; 1972; 1977; 1986) extracted the historical-socio-cultural premises (PHSC) from popular sayings, proverbs and other forms of popular communication. The present symposium based on this late approach shows appraisals of different personality variables and looks for applications of the found knowledge to develop a better society.

An etnocultural approach to estimate social desirable responses

DOMINQUEZ ESPINOSA, A (Iberoamerican university)

Socially desirable responding (SDR) is typically defined as the tendency to give positive self-descriptions (Paulhus, 2002). Many researchers have focused on distinguishing SDR from related constructs and developed scales, but not many have explored in detail the ecocultural validity of such measures, and their suitability in other cultural context, rather than where they were developed. All the important scales (e. g. Marlowe & Crowne, BIDR, Eysenck, Lie Scale from MMPI, Edwards, Jackson, etc.) have been developed in English speaking
countries, and many of them, based on other related measures (e.g., BIDR was based on the SDQ and OCQ, Sackeim & Gur, 1979) assuming as if the items contents were universal. Using qualitative and quantitative techniques, a pool of items was developed in order to assess socially desirable responding both as a response set (a temporary tendency caused by situational demands) and as response style (a trait-like tendency). Based in the idea that Social Desirability has two components, the items were rationally composed to distinguish the dimension of self-deceptive enhancement and impression management. A total of 94 items constituted the preliminary version of the scale. It was applied to a non-probabilistic sex-balance sample of 200 Mexican participants, concurrently with the BIDR. The results show significant correlation between the self-deceptive dimension in eight of twelve dimensions that constituted the Mexican scale, but none with the impression management dimension. The final remarks are discussed in terms of the utility of ethno-cultural approaches to develop cultural-sensible scales.

Keywords: eco-cultural validity, response style, social desirability, self-deceptive enhancement, impression management

Applied implications of assertiveness and historical socio-cultural premises in Mexican adolescents

FLORES GALAZ, M.M (University of Yucatan)

The Mexican Ethnopsychology proposed by Diaz-Guerrero (1972, 1994, and 2003) is directed at identifying both the idiosyncratic or particular characteristics of the Mexican, as well as the general characteristics of human beings. In order to address indigenous character of a culture, he begins by defining socio-culture as a system of interrelated cultural premises that govern the feelings and ideas, and guide the interpersonal relations, stipulates the rolls that have to be carried out and the rules for the interaction of individuals for each role. That is to say, it specifies the where, when, with whom and how to behave. In order to operationalize socio-culture, Diaz-Guerrero (1955; 1963; 1967; 1972; 1977; 1986) extracted the historical-socio-cultural premises (PHSC) from popular sayings, proverbs and other forms of popular communication. Using ethno-psychological methodologies, Flores and Diaz-Loving (2004) have studied assertiveness in Mexico for 20 years. These authors argue that having the capacity to emit an assertive behavior is going to depend on the cultural context in which the individual grew. Furthermore, it is expected that even within a same culture, education, social status, sex, age, personality, etc. will also affect its emission and interpretation. To fully understand the phenomena, the conceptualization and operationalization of assertiveness in Mexico was derived from a series of exploratory studies that included assessing the effects of a family based collectivism that is centered on harmonious interactions (Flores, 2004). The purpose of the present study was to determine the relationship between assertiveness and the degree of attachment to the traditional historic-socio-cultural premises of the Mexican culture in adolescents. 801 students of public secondary and High schools and participated, selected by means of a non-probabilistic sampling method based on clusters by ecosystem, sex and schooling of the State of Yucatan, 406 men and 395 women, with an average age of 15.95 years participated. The Multidimensional de Assertiveness Scale that measures Indirect Assertiveness, non Assertiveness and Assertiveness in everyday situations was administered (EMA) (Flores and Diaz-Loving, 2004) together with the historic-socio-cultural Premises Inventory conformed by nine factors: Obedience Affiliativa, Machismo, Virginity, Consent, Fear to the Authority, Familiar Quo Status, Respect on love, familiar Honor and Cultural Rigidity (Diaz-Guerrero, 1972; 1993. Results show significant correlations indicating that the greater the assertiveness, the less individuals adhere to traditional premises, that is to say, less attachment to the PHSC. To the need of basic knowledge of culture for interventions directed at organizations, clinical work and communities will be discussed.

Power and acculturation in Mexico
Power is determined by the members of a society, a group, a family, a couple and is constituted by a structural and ideological component. (Schwebel, 1994 en Atwood y Scholtz, 2005). The structural refers to the hierarchical position of each member within a group; the second indicates the position the member should have (Dallos, 1997 en Atwood y Scholtz, 2005). It should be stated that power occurs within cultural boundaries, thus, acculturation, which refers to the process of adapting the culture of origin to another one, needs to be considered when analyzing power. Acculturation can be assessed mainly through attitudinal and behavioral changes (Antsel, 2002; Berry, 1980; Marín and Marín, 1991; Rogler, Cortés and Malgrady, 1991; in Christenson, Zabriskie, Eggett and Freeman, 2006). Given that power refers to the way that we impose a position guided by norms and believes, it is essential to study the socio-cultural guidelines given in the cultural premises of each ecosystem (Diaz Guerrero, 1993, 2007). In fact, it is expected that traditional people in Mexico use strategies congruent with a culture that stresses love and indirect speech; while, as individuals in these family oriented collectivistic culture become less attached to traditional premises, they should use power strategies in line with the new culture they are identifying with. With the intent of observing the effects of acculturation processes moving subjects from a family based collectivistic orientation toward an instrumental individualistic position on the preferred power strategies, 601 Mexicans, 302 females and 299 males with ages between 18 and 79 (M=40.39, SD=12.51) with an average of 15.8 years in a couple relationship responded an acculturation scale (ARSMA-II, Cuellar, Arnold & Maldonado, 1995) and a power strategies scale (Rivera & Díaz Loving, 2002). Results show a congruent correlation pattern between power strategies and acculturation. With respect to Mexican traditionalism, people with this direction use affective-positive, fairness-reciprocity, direct rational and of affect-request power strategies. On the other hand, people with an Anglo-American orientation, use direct unilateral behaviors such as imposition-manipulation, disqualify, negative affection, coercion, blackmail and dominion. For the marginalization subscale, a single positive significant relation was found with the negative strategies (imposition-manipulation, disqualifying, negative affection and blackmail). Findings fit the hypothesis that Mexicans attached to traditional family collectivistic premises tend to make use of power strategies that emphasize maintaining affable relationships. As stated by Diaz Guerrero (2007), the Mexican culture favors self-modification over self-affirmation. Discussion will center on the role of culture on the strategies people use to modify their social environment, and particularly how positive affect strategies are successful in an affiliative obedient culture when requesting something that originally the other does not wish to do and that nevertheless, if these means are culturally appropriate, that others, will subjugate to the request.

Mexicans’ self concept and self esteem from ethnopsychometric’s perspective

REYES LAGUNES, I. (National Autonomous university of Mexico), KUNA-BRONIOWSKA, A. (Poland Academy of Science)

Given its long and varied history, the terms have had a great diversity of definitions generated by different traditions of research, findings, and practical applications. Several studies (e.g. La Rosa & Díaz-Loving, 1991; Reyes-Lagunes, Ahumada & Díaz-Guerrero, 1966, Valdez & Reyes-Lagunes, 1993, 1996) have proven translation and adaptation of foreign originated tests don’t assess validly these concepts, consequently the aim of this paper is to present two goals: The development of two indigenous psychometric tests for the Mexican culture and differences found in different regions in our country. Construct’s definitions are also proposed. Based on the theoretical definitions of the constructs, the Natural Semantic Network Method (Reyes-Lagunes, 1993) was used to obtained a representative sample of
characteristics which Mexicans attribute to themselves and the overall appraisal of their worth. 300 individuals with ages ranging from 18 to 25 years old from three different regions, north, central and south of Mexico responded to the scales. Both scales are psychometrically valid with high internal reliability. Self concept scores are generally higher than self esteem. Significant differences by region and sex were found in some of the factors. There is an extreme need to develop cultural relevant test to be able to develop efficient and relevant programs.

Keywords: psychometric tests, Mexican, self concept, self-esteem, ethnopsychology

Implications of Mexican historic-socio-cultural premises and copying styles

DIAZ LOVING, R. (National Autonomous University of Mexico)

It is believed that all cultures have developed or institutionalized means to address and satisfy human needs. The resulting pattern of norms values and believes resulting from cultural evolution can be used to characterize a given culture or a group of cultures and has direct consequences on the behavior of its members (Diaz Guerrero, 2007). To specify the set of behavioral rules, Diaz Guerrero forged the socio-cultural premises within the framework of Mexican Ethnopsychology. The premises are simple or complex statements that provide bases for the specific logic with groups. These premises are learned from significant figures of authority within a cultural context and are reinforced by all the adults of a socio-cultural group (Diaz Guerrero, 1982, 2007). From the constant dialectic between premises and psychobiological individual needs, copying strategies are developed to face everyday experience. These styles are engulfed in the Philosophy of Life which are two distinct strategies directed at changing oneself or the environment when faced with a problem. On the one hand, traditional Mexicans are impelled to modify themselves in order to solve problems, while more individualistic members of this culture tend to modify their environment and/or to others to solve their problems. Originally this dichotomy was denominated the passive active syndromes (Diaz-Guerrero, 2007). With the purpose of knowing the relation between the PHSCs and the Philosophy of Life, the original (Diaz Guerrero, 1972, 1993) 123 premises and the Philosophy of Life scale (Diaz Guerrero, 1972, 1993) were applied to 1706 voluntary participants. Given the importance of education on the attachment to cultural norms, participants were selected to represent a wide range, 248 were college students, 630 high school students, 586 secondary students and 242 elementary school students. The age range of the participants went from 10 to 25 years. All belonged to state schools within Mexico City. Results generally show a consistent pattern between premises factors and life philosophy. Specifically, machismo and the acceptance of independence are positively related to internal-active control and autonomy and in negative form with love and caution. For affiliative obedience, results show a positive relation to interdependence, and a negative one with active internal control and boldness. On the other hand, the family honor factor is correlated in negative form with the love-power dichotomy and positively with autonomy-interdependence. In general, data shows that people with a self-modifying style adopt traditional premises like affiliative obedience. The findings are discussed based on the need of knowledge of the cultural effects on the development of interventions in health and community psychology.

Applied psychological research in the service of evidence-based social policy in Hong Kong and Beijing

Chair(s): CHAN, C. (Department of Applied Social Sciences Hong Kong Polytechnic University)

Discussant(s): CHAN, C. (Department of Applied Social Sciences Hong Kong Polytechnic University)

This symposium aims to demonstrate how applied psychological research programs are being translated into quality practice and contribute to city-wide social policy and services deliberations. Since re-united with the Chinese Mainland in 1997, the Hong Kong SAR Government has, perhaps inadvertently, made great strides toward evidence-based social policy through the setting up of a number of designated funds to augment policy reforms in health, welfare and education. This has attracted cross-sector researchers and practitioners to compete for funding on large-scale social experimentations. This symposium will include two theoretical and empirical papers focus on the social policy agenda surrounding the setting up of the HK$300 million Child Development Fund pioneer projects which aims at deriving longer-term policy on inter-generational poverty alleviation among child and youth from disadvantaged families. The Fund has planned to cover a total of 13,600 families. In addition, two empirical papers from Beijing and Shanghai conducted in eight migrant worker children schools through a collaborative effort of nine universities will be used to contrast the HK model. Key learning objectives include: 1. A review of how transactional (Sameroff, 2009) and relational model of development theories (Lerner, 2002), in the tradition of community and clinical psychology, have influenced the debate and choice of conceptual models of poverty alleviation policy and ultimately the design of city-wide programs; 2. A discussion of how applied psychological researchers co-create and evaluate the program with multiple stakeholders including the government, the community, the faith-based sector and low-income families; 3. Generating empirically-supported practice from process and outcome data gathered from the program. This will be illustrated by a number of scientific papers on adolescent mental health, after-school activities, mentor relationship quality and asset-building mechanism including matched saving behaviors.

Community psychology and inter-generational poverty alleviation – Towards asset building communities in Hong Kong & Beijing

CHAN, C. (Department of Applied Social Sciences Hong Kong Polytechnic University)

This paper aims to provide an overview of how a number of asset-building programs come into operation in Hong Kong and Beijing since 2007 initiated and led by a group of community and clinical psychologists with backgrounds in developmental science, counseling, public health and social and cultural psychology. In consort with community advocates, social workers and policy makers, community coalitions are formed receiving official recognition of their contributions to launching pioneer projects in both Hong Kong and Beijing. Small scale publically funded pilot projects have become the main platforms for the deliberation of conceptual models and outcomes indicators for large scale, city-wide programs. Public consultations, formation of community coalitions and alliance have also been instrumental in the tri-partite effort of government-corporate-community in the program implementation phase. Core methods from applied developmental sciences are deployed for generating empirically-supported practice in these programs. Champion and supported by the HKSAR government, the Child Development Fund Pioneer Projects has planned to double its uptake as well coverage in more needy districts. Program integrity is being systematically monitored with supported as the projects move into its final stage of implementation. Data demonstrated a higher level of outcome attainment in relation to comparable programs in other parts of the world. Applied psychological research has made its presence in many existing policy-
driven social experimentations. There are signs that officials in the Chinese Mainland are increasing showing interest with support first to small-scale pilots projects especially initiated by university academics and researchers in collaboration with community stakeholders. The Hong Kong Child Development Fund may, in time, serves as a prototype for a stage model of applied psychological research in the service of evidence-based social policy.

Keywords: asset-building programs, community psychology, clinical psychologists, Child Development Fund Pioneer Projects, applied psychology

Chinese migrant children's career efficacy and mental health: The roles of mentor relationship quality and self efficacy

JUN, Y. (Department of Applied Social Sciences
Hong Kong Polytechnic University)

The current study aimed to examine whether immigrant children's relationship quality with their mentors could make unique contributions in predicting their career efficacy and mental health, above and beyond the prediction from their relationship quality with parents. In addition, based on social cognitive theory (Bandura, 1986), it was also proposed that migrant children's self efficacy beliefs may mediate the positive effects of mentor relationship quality on career efficacy and mental health. A survey study was conducted among Chinese migrant children (N = 114) who joined a mentorship program at Beijing, Chinese Mainland. Participants were asked to complete the questionnaires based on their experience in the mentorship program. One hundred and fourteen immigrant children (48 males and 64 females) provided valid data for the study. Their average age was 15.00 (SD = 1.72). Two participants did not indicate their gender and three participants did not indicate their age. Mentor relationship quality (α = .92), relationship quality with parents (α = .85) self efficacy (α = .86), career efficacy (α = .85) and mental health (α = .79) were measured by items established in previous studies. The results of regression analysis showed that after controlling the effects of parent relationship quality, mentor relationship quality made unique contribution in predicting immigrant children's career efficacy (β = .31, t = 3.60, p < .001) and mental health (β = .28, t = 3.15, p < .01). In addition, path analysis revealed that the positive effects of mentor relationship quality on career efficacy and mental health were fully mediated by children's self efficacy beliefs (χ² = 6.26, df = 5, CFI = .99, RMSEA = .07). The quality of mentor-mentee relationship served as significant predictor for immigrant children’ career efficacy and mental health; moreover, the relations were fully mediated by self efficacy beliefs, which suggested a social cognitive mechanism for the positive effects of mentorship program.

Keywords: immigrants, mentors, career efficacy, mental health, social cognitive theory

A person-oriented approach to unravel the complex relations between after-school activities, resilience and social support among mobile children in Beijing and Shanghai

LAI, S. (Department of Applied Social Sciences
Hong Kong Polytechnic University)

An estimated 10% population in Chinese Mainland is rural-to-urban migrants and 12% of this population is children of school age. After-school activities can be important resources to development in mobile child as they generally showed a lower resilience and social support than their local counterpart. Studying the relationship of after-school activities with resilience and social support can provide useful information to the design of supportive and intervention programs to mobile children (they are known as mobile children because their migration in the absence of a residency permit in the city (hukous) may not be permanent). A person-oriented analytical strategy was applied to study the time children spent on after-school activities. Clusters of children with different profiles of after-school activity participation were identified by the SLEIPNER program (Bergman, Magnusson, & El-Khoury, 2003). Levels of resilience and social support were compared between mobile and local children with different profile of after-school activity participation. Regression analyses were used to identify useful predictors of resilience and social support levels. The 1070 students
were grouped into 6 clusters: Inactive (487, 45.51%), Overloaded (169, 15.79%), TV/Game Indulged (158, 14.77%), Responsible (111, 10.37%), Outgoing (84, 7.85%), and Independent (61, 5.70%). Membership of after-school activity profile associated with background of children ($\chi^2 = 44.45, p < 0.001$). Family social support in TV/Game Indulged students were significantly lower than Outgoing students ($Z = -3.06, p = 0.002$). Resilience in TV/Game Indulged students were significantly lower than Passive, Responsible and Self-reliance students ($Zs < -2.99, ps < 0.003$). Findings from regression analyses confirmed the adjusted negative effect of indulgence in TV/Game on resilience ($t = -4.41, p < 0.001$) and family social support ($t = -3.22, p = 0.001$). An alternative approach to study after-school activities in children is to treat participation in different activities as a whole and relating them to the children's background and important developmental outcomes. Mobile children in private schools were lower in resilience and social support than their local counterparts in public schools and indulgence in TV/Game would produce an added negative effect.

**Keywords:** after-school activities, resilience, social support, migrants, children

**Saving behavior among adolescents in a matched saving plan in Hong Kong: The role of institutional factor on saving behavior**

CHAN, K. (Department of Applied Social Sciences, Hong Kong Polytechnic University)

Saving behavior in adolescents, especially among those engaged in matched saving plans, is influenced by interpersonal and institutional factors (Sherraden, 1991). Current evidence on adolescents saving behavior suggested while girls and older adolescents tend to save more and save more regularly, institutional factors such as the availability of an individual account or mechanism for direct deposit were also reliable predictor of adolescent saving behavior. The present study explores the effect of interpersonal factors (i.e. age, gender), and institutional factors on saving behaviors among adolescents. Saving record data from a territory-wide child saving program in Hong Kong ($n = 750$), along with information on age and gender of participants, and institutional factor towards saving (individual account for each participants or pooled account for all participants under an operating organization) were analyzed in an observational design study. Continuous saving behavior is defined as a dichotomous categorical variable on whether a program participant has made consistent and consecutive deposits over a three-month span in year 2009. Effect of gender, age, and saving account type on the dichotomous saving behavior was modeled with a logistic regression model. More families with girl maintained continuous saving behavior within a 3-month span than their counterparts with boys, and age of adolescent in the saving program household revealed a mild and positive association with continuous saving behavior; yet neither of the effect from gender (Odds ratio = 1.22, $p = 0.464$) nor age (Odds ratio = 1.03, $p = 0.714$) factors reach statistical significance. Controlling for the effect of age and gender, saving account type was significantly associated with consistent saving behavior (Odds ratio = 3.45, $p < 0.01$). Account type was a significant predictor of consistent saving behavior, lending support to the institutional saving theory (Sherraden, Schreiner, & Beverly, 2003) that suggests individuals are more likely to save in an environment where the saving institution provides access, information, incentives, and facilitation to their savings. Although the observed effects did not reach statistical significance, the present findings also echoed similar reports where older adolescents and girls are more likely to save and save more.

**Keywords:** adolescents, saving behaviour, gender differences, interpersonal factors, incentives
Applied psychology in Latin American Countries: Theoretical and methodological issues

Chair(s): MALUF, M. R (PUCSP)
Discussant(s): KOLLER, S. (UFRGS)

Psychology research work in Latin American countries is currently carried out within a huge framework of diversity. A deep interest in Applied Psychology studies have stemmed from the urgent social needs found in these countries. This symposium will focus on a variety of topics that address such studies. 1. While developing in Brazil, social psychology has undergone some remarkable changes in the last forty years, and currently encompasses its own features as a theoretical, research, and teaching approach. 2. Research programs developed in Argentina have approached children’s development issues with a particular focus on socially vulnerable children. The results presented in this symposium refer to precursor processes of pro-social behavior and the impact caused by environmental stress on children living in poverty. 3. Recent advanced developments in reading cognitive psychology have presented evidences that reading/writing learning is based on two axes, decoding and comprehension. Some training studies will be exposed along this theoretical/methodological approach, thereby providing evidence on how writing learning can be ensured to the vast majority of unprivileged children who attend schools in Latin America. 4. Theoretical and methodological proposals by some cross-cultural psychologists will then be presented as well as the development of a Mexican ethnopsychology. Some evidences will be presented to show that indigenous approaches to psychological investigation do provide an important corrective tool to untested assumptions about the universal applicability of currently popular perspectives. 5. Eventually, a professional psychologist will foster some discussion about the proposals presented in this symposium.

Transformations in social psychology in Brazil since 1968

SCHEIBE, K. E (Wesleyan University)

The aim of this study was to describe the changes that have taken place in theories, concepts and research practices in social psychology in Brazil in the past 41 years. The author gave the first social psychology course at the Federal University of Brasilia in 1968. In 1972, he returned to the Pontifícia Universidade Católica de São Paulo (PUCSP) supported by a Fulbright Fellowship, where he helped to found the first post-graduate program in social psychology at that university. He returned frequently to the PUCSP after the 1972-73 year, and taught short programs as well at other universities in Brasil, including the University of São Paulo the Federal University of Minas Gerais, Pontifícia Universidade Católica de Rio de Janeiro, the Universidade de Campinas, and the University of São Paulo at Riberão Preto (USP). In 1984 he returned to PUCSP supported by another Fulbright award, to teach courses in the graduate program in social psychology. Since that time, he has been invited to return to São Paulo on many occasions to make presentations, advise students, or to serve on doctoral committees for graduate students in social psychology. These many visits have allowed opportunities to observe the development of social psychology in Brazil over the past 41 years. From extremely small beginnings in the late 1960’s, social psychology in Brazil has developed into a conspicuous, powerful, and highly regarded subfield of psychological theory and research. In 1980, a national organization was founded in order to support the communications, research, development and support for the subdiscipline (ABRAPSO—Associação Brasileira de Psicologia Social). The journal Psicologia e Sociedade has published continuously since that time. ABRAPSO holds popular regional and national congresses. From the late 1960’s, when Educational Psychology, Clinical Psychology, and Skinnerian Psychology dominated psychology as a field of study and research in Brazil, Social Psychology has established itself as a major subfield of psychological research and teaching. In particular, the study of transformations in
Precursor processes of prosocial behaviour in children and strengthening of psychological resources in children at extreme poverty

RICHAUD DE MINZI, M. C. (CIIPME-CONICET)

In this work I am going to present two important issues of child development that we work in CIIPME-CONICET, Argentina. In the first: “Precursor processes of prosocial behaviour”, we establish that the understanding of others’ emotions, the regulation of emotional expressiveness, and the others’ emotions (the ability to generate or modulate the others’ emotions by comforting and encouraging them) are keys for the establishment of bonds and for the development of social competences. Our aim is to test a model, including empathy as a multidimensional construct, that explains the understanding of others’ subjective experience and the sharing sense, and depends of dispositional and social aspects. Also, empathy would explain prosocial moral reasoning processes, positive emotions and would facilitate prosocial behaviour and inhibit aggressiveness. We will present partial results of this project. Some conclusions of relationships between dispositional and social processes and prosocial behaviour are key processes in the understanding of children at risk behaviour. Several environmental factors may affect the processes of brain-development, although one of the most relevant is the impact caused by environmental stress. Stress causes an increase of the cortisol level in the blood. Excessively high and constant levels of cortisol in the brain prevent neuronal growth and synapses formation in the child. Given that situation, the risk of cognitive and socio-emotional deficit is round the corner. Prior research has shown that the presence of a sensitive caregiver that responds to children’s needs can prevent the increase of cortisol. Children who grow up in families with social vulnerability present with high levels of cortisol. If children live in a chaotic and threatening world, the brain of these children focuses on survival strategies and does not develop cognitive and social abilities. Results demonstrate that it is better to develop intervention and prevention programs because a great part of their action in experiential. This demonstrates that the observed phenomena in poor children are the result of adverse environments (Farah, et al., 2006). We will present results that indicate that a continuum, intense and controlled work can obtain great progress in psychological resources in children at environmental risk.

Keywords: child development, prosocial behaviour, empathy, moral reasoning, social vulnerability

Teaching reading & writing at school and children endangered by poverty

MALUF, M. R. (PUCSP)

Teaching reading and writing at school is often a politically biased issue. The conclusions reached by researchers are not usually shared by teacher trainers or professionals in charge of government programs in many countries. There appears to be evidence that the existing gap between researchers and policy makers also take place in Brazil. In this country, where children are taught how to read and write in the Portuguese language, children from families endangered by poverty are the most affected victims of such a gap. Recent research has shown that there is a relationship between cognitive variables and the alphabetic system learning, whereby it is possible to investigate what is specific in reading and writing activities. This presentation embraces reading cognitive psychology hypotheses, which investigate the mental mechanisms implied in reading and writing learning. The aim is to explore the implications of this theoretical/methodological approach for educational practices by presenting the results of experimental training researches. These researches provided evidence that children can learn better at school and can also overcome learning handicaps provided that teaching methods include metalinguistic skills training. The results show that this approach may be particularly useful among unprivileged children who have no stimulating reading and writing.
experiences in their everyday life. It is thereby concluded that the question is not knowing whether or not the alphabetic code should be taught, but rather how it should be taught.

Keywords: teaching, reading, writing, poverty, learning handicaps

Applying psychological research: Insights from ethnopsychology

DIAZ-LOVING, R. (National Autonomous University of Mexico)

Indigenous approaches to psychological investigation provide an important corrective to untested assumptions about the universal applicability of currently popular perspectives. In fact, attempts of curving rampant intuitive interpretations of non equivalent samples and variables across alleged cultures by suggesting specific methodological strategies (Poortinga & Malpass (1986), have generally fallen on deaf ears. In response, data from a truly ecological or cultural perspective requires the direct inclusion or measurement of cultural and structural variables as well as the functional relationship of psychological variables within a cultural system, before any attempt of cross-cultural comparisons are made. In consideration of the sound methodological and theoretical proposals made by some cross-cultural psychologists, but ignored by most, we will review the development of a Mexican ethnopsychoogy (e.g. Diaz-Guerrero, 1994; 2002), which is directed from a universal conception of psychology, but also stresses the importance of measuring psychological manifestations of culture through norms, beliefs, values and education, the behavioral manifestations of psychological constructs common to the participants in different subcultures, and the interrelationship between cultural and psychological variables. The diagnosis, intervention and evaluation of impact of any applied research or program must consider these cultural variations in order to be both ethical and effective. This will be discussed in light of current trends in psychological practice in Mexico.

Keywords: Indigenous, cross-cultural comparisons, ethnopsychoogy, beliefs, values

Aspects of counselling in Europe

Chair(s): DI FABIO, A. (University of Florence)

Discussant(s): GUICHARD, J. (Institut National d’Etudes du Travail et d’Orientation Professionnelle)

This symposium aims to contribute to clarifying the current situation of counseling in Europe from both theoretical and practical perspectives. The cases of four nations (Italy, France, Portugal, Switzerland) are briefly described. This comparison reveals a common denominator: counseling in these countries seems to be primarily career counseling. A fifth report regards the effects of counseling in general, but also with regard to career counseling. Departing from this topic, the following questions will be dealt with: (1) If and in what other fields does counseling intervention exist? (2) If so, how can we account for the gap between career counseling and other forms of counseling? (3) Would reducing it be beneficial? (4) If yes, then how? Through the development of a common training program (Masters)? And what type (Masters)? And based on what common knowledge? And does a common counseling culture exist in Europe? The learning objectives of this symposium are to: (1) Develop an awareness of the complexity of the counseling situation in Europe; (2) Introduce the different European situations which will allow similarities and specificities to emerge; (3) Construct a shared framework which also considers the needs connected with the training of counselors; (4) Stimulate, in Europe as well, scientific research on counseling, empowering cross-cultural research, to nurture and promote the quality of professional intervention.

Counseling in Italy: Complexity, points of strength, areas of improvement

DI FABIO, A. (University of Florence)

The presentation deals with the reality of counseling in Italy, from its success to its current configuration, to the complexity of the problematic issues present in counseling in this country. If on one hand, a sudden spread of
the linguistic label has occurred during the last decade, whose use is not often adequately supported by scientifically established theoretical bases; on the other hand, we have seen various significant events for the construction of a scientific culture in counseling in Italy, for example the birth of the first Italian scientific journal on this topic engaged in the safeguarding of the theoretical principles that inspire counseling in the scientific literature. The presentation highlights: the problems tied to the plurality of actions and interventions that counseling implies (Guichard, in press; Guichard & Huteau, 2001) and the need to safeguard the psychological foundation and the non-directivity principles in the counselor/client relationship; a view of the different fields of application, with reference to a taxonomy divided into informative counseling, crisis counseling, problem solving and decision-making counseling (Di Fabio, 1999; Savickas, 2004). The presentation will describe a study on the characteristics of training courses provided in Italy by counseling schools present in the lists of three principal Italian professional associations. Problematic aspects tied to the regulation of the formative structure in Italy concerning this professionalism emerged. The importance of promoting, in Italy, a scientific culture of counseling on one hand and scientific research on counseling on the other will be discussed, as well as empowering cross-cultural research to feed and promote the quality of professional interventions (Di Fabio & Bernaud, 2008; Gysbers, Heppner, & Johnson, 2003; Young, Valach, & Domene, 2005).

**Keywords:** counselling, crisis counseling, decision making, cross-cultural, Italy

**Career counseling in France: An evolving heterogeneous field**

COHEN-SCALI, V. (University of Caen)

This communication aims at providing an overview of the current developments in terms of career counseling practices and professions in France. The situation of the counseling field can be described as heterogeneous and paradoxical for two reasons that will be explained. The first reason is linked to the fact that the living conditions in the past twenty years have led to an increased social need for career counseling. As a result, there has been an increased number of career counselors in France who do not feel they belong to the same professional family. The second one concerns the weaknesses of the career counseling training issues. Only a few counseling certifications in France exist. Only one academic path awards the French State Master’s Degree of School and Career Counseling. Some professional counselors have a Master’s degree in human and social sciences, but some have no specific degree. The presentation will focus on the strengths, weaknesses, opportunities and challenges that the career counselor and researchers will have to deal with in France in the future. Among these difficulties, the current concerns of cost restrictions in public services which will cause important changes in the practice of counselors and a major reorganization of the field of counseling as a commercial service will be emphasized.

**Keywords:** career counselling, training, social sciences, counselling, France

**Career counseling in Europe or the contextualization of counseling: A case study from Portugal**

DUARTE, M. E. (University of Lisbon)

This presentation deals with the necessity of new conceptualizations in the field of career counseling, in order to achieve an articulated framework integrating the traditional psychological and social determinants as well as new conceptualizations: idiographic profiles, the mapping of socio-cultural contexts, and the interaction with the real world. A new rationale in the career counseling domain is presented alongside the identification of cues, both pertaining and leading to the prediction of personal well-being. These aspects are illustrated using a case study. This Portuguese presentation intends to highlight the importance of contextualization. A case study is presented following the outline of life-design career counseling, and illustrates this new way to view career counseling. The results are presented, as well as case notes filed after each counseling session. Career counseling
must not only serve the purpose of describing or explaining behaviors, but it should address the issues of the individual’s entire life contexts. However, globalization determines shifts, frequently not precisely predictable. The path seems to be the implementation of a comprehensive model built upon a comprehensive construct, in which psychological and contextual differences can be taken into account.

Counseling in context and evolution of core competencies: The case of Switzerland

DAUWALDER, J. P. (University of Lausanne)

There is a co-evolution between societal needs and requested counseling skills or counselor competencies. Recent trends in Europe focus upon the definition of core competencies. However, continuous adaptation to changing contexts suggests polyvalent use of a growing diversity of methods and techniques. We will try to show that experienced counselors, as compared to younger colleagues, develop contextualized uses of their skills. A set of 13 core competencies has recently been defined and implemented as a common quality standard for career counseling in Switzerland. The differentiated use of the counselor’s skills has been documented through a survey of experienced (N = 53) and less experienced (N = 49) counselors in different settings. Whereas experienced counselors generally report higher levels of competencies, a significant drop in research-related competencies has been observed, as compared to younger colleagues. Moreover, in function of the setting where counseling takes place, different profiles of specialization with ‘local’ particularities emerge. These results will be discussed in light of the new trends in life-long and life-wide counseling, such as ‘life-designing’ (Savickas et al., 2009). Not only the research-controlled (and thus sustainable) use of core competencies has to be promoted, but additionally the ‘meta-conceptualization’ of indications and control criteria for differentiated use of complementary techniques and methods has to be developed.

Keywords: counselling skills, counselor competencies, career counselling, life-designing, Switzerland

Perceived effects of career counseling and client satisfaction: An empirical study

DI FABIO, A. (University of Florence)

The study of the efficacy of intervention constitutes an important subject area in the field of career counseling (Di Fabio & Bernaud, 2008; Guichard & Huteau, 2001; Heppner & Heppner, 2003; Whiston, Sexton, & Lasoff, 1998) and in the framework of the new paradigm, life designing career counseling (Savickas et al., in press), which focuses on individual subjectivity in a life-long, holistic, contextual and preventive perspective. The aim of the present study was to analyze the role of the perceived behavior of the career counselor and the counselor’s characteristics and the modality of intervention in relation to client satisfaction and the perceived effects of the career counseling intervention. The questionnaire was administered to a sample of 1,287 university and high school students from Tuscany. Nine hundred sixty-six subjects were excluded because they declared they had never met a career counselor. The sample of the present research consists of 321 participants, consisting of 190 university students (59.30%) and 131 high school students (40.70%). The questionnaire was composed of the following elements: a first part designed to demonstrate the characteristics of the career counselor and the intervention modality; a single item to evaluate client satisfaction; a scale to evaluate perceived effects of the career counseling intervention and a scale to evaluate perceived behavior of the career counselor. The criterion necessary to be included in the sample was to have had a counseling session with a career counselor at least once. Correlations and multiple regressions were conducted. It emerged that client satisfaction can be explained principally by perceived relational behaviors of the career counselor, while the perceived effects of the career counseling intervention (awareness of self, awareness of
environment, psychological mobilization, insertion ability) are better explained by perceived technical behavior. The results provide further consideration (Bernaud, Di Fabio, & Mpouki, 2006) of the efficacy of career counseling intervention in an Italian context, delineating new areas of future research and intervention.

Assessing development of junior high and high school students’ generic skills through participation to School Events Analysing System (SEAS)

Chair(s): SUGIMORI, S. (Tokyo Gakugei University)
Discussant(s): MCGAW, B. (Melbourne University)

Measuring, evaluating, and developing children’s generic skills is a core topic of education in the global context. To measure students’ generic skills within a context of school events, Tokyo Gakugei University and JTB Business World Tokyo Corp. have invented “SEAS: School Events Analyzing System”. The system has already been used by nearly 100 private or national junior high and high schools in Tokyo Metropolitan area, and more than 50 thousand students have answered to the questionnaire. This system aims to measure the development of generic skills through participating to three types of school events: cultural events, sports events, and traveling events. This system assesses the development of students’ various generic skills by six dimensions along with their attachment to schools, degree of efforts made to participate to the school events, degree of satisfaction felt by the participation. This system feedback the results to schools on the class, grade, and event basis. This system has also proven to be useful for the assessment of development of students’ generic skills through various events and activities inside and outside of schools. The first speaker, Kazushiro Ueki, explains how the system is utilized by various schools for various purposes including school evaluation, planning for the next school events, and vice versa. The second speaker, Dr. Masami Hayashi presents the Japanese educational system of extracurricular activities. The third speaker, Dr. Shinkichi Sugimori, and the fourth speaker Dr Satoe Fukui present about the psychological findings through various data analysis. As a discussant, Dr. Barry McGaw at Melbourne University, one of the
representative persons of controlling global
trends of measuring generic skills gives
comments to the reports.

Systems and case reports of “SEAS”

UEKI, K. (JTB Business World Tokyo Corp.), ARIMA,
T. (JTB Business World Tokyo Corp.)

Through the development and feedbacks of
the results of School Events Analyzing System
(SEAS) to, plenty of valuable findings were
acquired. This presentation is intended to
show the fruitfulness of the system of SEAS,
and the way they are utilized by various school
settings. Through feedbacks to dozens of
schools about the results of SEAS, creative
dialogue between researchers and teachers
were made. Based on the various case studies,
it was found that the results of SEAS reflect
important aspects of school events, most of
which is being noticed by the teachers, but
some of the results reflect implicit group
processes of students which cannot be noticed
by the teachers. When we feedback these
unnoticed implicit group processes of the
students, creative dialogue between researchers and teachers are made, which
would bring fruitful discoveries. SEAS is found
to be very helpful tool to activate school
events, to promote teachers’ understanding of
students, and to measure development of
generic skills of students.

Keywords: schools, school events analyzing
system, implicit group processes, teachers, generic
skills

Pedagogical backgrounds of SEAS

HAYASHI, M. (Tokyo Gakugei University)

SEAS is intended to measure the effects of
extracurricular activities in an objective way.
Until SEAS was invented, the effects were
described by teachers’ subjective observation
with verbal descriptions. SEAS has made it
possible to assess the effects of school events
in more objective way, with objective
measurement. This report also present the
analysis of free responses by the students.
Analysis of the extracurricular activities in
Japan in reference to documents of the
Japanese Ministry of Sports, Science, and
Technologies. Along with these analyses, free
description written by students in various
events are analyzed using software for data
mining of free descriptions. It was found that
when the performance and satisfaction of
students are high (e.g., high performers),
teachers of these schools also find the event
fruitful. Thus, the quality of the students’
performance and the teachers’ evaluation are
keenly related with the students and teachers’
quality of activities. SEAS is an effective tool to
measure various aspects of the effects of
school events.

satisfaction, performance

Psychological analysis of the effects of
school events through SEAS (1)

SUGIMORI, S. (Tokyo Gakugei University)

This presentation is aimed to present recent
findings through statistical analysis of the data
gathered from the participants of SEAS.
Statistical analysis of the data of 50 thousands
students and a thousand of teachers, various
findings were obtained. It was found that the
self rated generic skills are highest among the
students participated into traveling events.
those with sports events were found to be
least in the sense of the development of
generic skills. It was also found that girls tend
to report higher sense of development than
boys. Also, it was found that cultural events
tend to facilitate the sense of attachment to
the schools. Students with higher sense of
satisfaction with the participation to the events
tend to make greater efforts for the
participation of events. If the sense of
satisfaction is lower compared with the sense
of efforts made, they are likely to be led to
move with extrinsic motivation. If the
subjective development of generic skills is
lower compared with the degree of
satisfaction, there is a possibility that the
activity of the event was focused to sensual
entertainments, and it did not facilitate inner
mental development. Data analysis of SEAS
found it clear that various developmental
aspects of generic skills are related with the
contents of the school events.
Psychological analysis of the effects of school events through SEAS (2)

FUKUI, S. (Tokyo Gakugei University)

This presentation is aimed to present recent findings through statistical analysis of the data gathered from the participants of SEAS. Statistical analysis of the data of 50 thousands students and a thousand of teachers, various findings were obtained. It was found that the self rated generic skills are highest among the students participated into traveling events. Those with sports events were found to be least in the sense of the development of generic skills. It was also found that girls tend to report higher sense of development than boys. Also, it was found that cultural events tend to facilitate the sense of attachment to the schools. Students with higher sense of satisfaction with the participation to the events tend to make greater efforts for the participation of events. If the sense of satisfaction is lower compared with the sense of efforts made, they are likely to be led to move with extrinsic motivation. If the subjective development of generic skills is lower compared with the degree of satisfaction, there is a possibility that the activity of the event was focused to sensual entertainments, and it did not facilitate inner mental development. Data analysis of SEAS found it clear that various developmental aspects of generic skills are related with the contents of the school events.

Assessing leadership characteristics across cultures

Chair(s): MOBLEY, W. H. (China Europe International Business School; Mobley Group Pacific)
Discussant(s): ARVEY, R. D. (National University of Singapore)

As economies become increasingly globalized, corporations and industries in many sectors are facing a range of leadership challenges. A deficit of qualified global leaders and the impact of poor leadership are highly evident. Understanding effective assessment of leadership characteristics in different cultures can help corporations not only to recruit high quality people, but also to identify high potentials for development in order to compete successfully globally. In this session, we have invited scholars from mainland China and Hong Kong China, France, Thailand, United Kingdom and the United States to discuss assessment of leadership, especially the application of personality instruments in leadership assessment in both Western and Eastern cultures. This symposium aims to better understand the following issues: (1) Key leadership characteristics, including personality traits, cognitive abilities, and behaviors in both Eastern and Western cultures; (2) Differences and similarities of leadership characteristics across cultures; (3) How can these characteristics be most effectively assessed across cultures? (4) What are the relationships among personality, competency and leadership behaviors? (5) How to assess and develop leaders based on the research findings? The presenters in this session will present data collected in China (including Hong Kong), Thailand and US from administration of the Work Behavior Inventory, Applied Reasoning Tests, Hogan Personality Inventory, SHL Universal Competency Questionnaire, among others. Specific issues will be addressed including leadership characteristics in these countries, different patterns of response, and personality’s impact on leadership behaviors. Following on, the presenters will discuss applications and share personal experiences in
leadership assessment and development in different cultures, and directions for new areas of research in using personality assessment tools across cultures.

Cross-cultural predictors of leadership effectiveness

PAGE, R. C. (Assessment Associates International)

This presentation addresses three strategically important issues: 1) What are the key predictors of leadership effectiveness? 2) How can these characteristics be most effectively assessed across cultures? 3) What are the characteristics of effective cross-cultural leadership assessment tools? To address these questions, we developed a set of cross-cultural cognitive ability and behavioral styles (personality) assessments. Using the Applied Reasoning Test (ART), we have investigated three facets of cognitive ability, including verbal ability, numerical ability and perceptual ability. In addition, using the Work Behavior Inventory (WBI), we have assessed a broad array of behavioral styles, including facets of the Big Five Personality Factors, as well as facets of Leadership Styles and Selling/Influencing styles. Over 2,000 individuals from China, Thailand and North America have completed one or more of these assessments. Our findings suggest that the same types of leadership dimensions predict leadership effectiveness in China and Thailand as in North America. The structural equivalence of the ART and the WBI was investigated using Chinese, Thai and North American samples. Results indicate that leadership cognitive ability is in close alignment with the two-factor model of Vernon (1965), consisting of Verbal and Perceptual ability. Moreover, analysis of the WBI indicates a common set of five factors that are consistent with the Big Five personality factors (Norman, 1963). Important conclusions from our findings are that there are a core set of leadership success characteristics that are relatively universal across cultures. A uniform set of assessment tools and a uniform set of leadership standards may be used across cultures to assess leadership effectiveness. However, it is critically important to define these characteristics and measures in ways that assure cultural and linguistic relevance to specific cultures. Specific examples of how to address these issues will be discussed.

Keywords: leadership, cross-cultural, assessment, work Behavior Inventory, big five model of personality

Use and application of Big 5 personality assessment tools in cross cultural settings

PAYNE, T. (Human Resources, Asia for Hanesbrands Inc.)

The aim of this study is to provide actual experience in the application and use of cross cultural personality assessment in selection decisions in Asia. This presentation will focus on application and use of Big 5 personality tests delivered in Thailand across a number of different organizations. Data collected from administration of a Big 5 Personality assessment tool over a four year period in Thailand will be presented. The instrument is the Work Behavior Inventory (WBI). It has been translated into Thai and revised over a number of years. The WBI consistently differentiates the Big 5 factors in the Thai language version and shows high reliabilities. The reliabilities in Thailand are very similar to those in the English version. The presentation will cover some of the key learning’s of practitioners. The results will show that the WBI is a reliable Big 5 Personality assessment tool both in English and in Thai. The presenter will present data collected over a number of applications and also share both the personal experience in application of the WBI in selection and candidate assessment and will discuss the possibilities for new areas of research in using personality assessment tools cross culturally. Specific areas addressed will be any differences between Asian and Western response patterns and whether there are any differences in the Big 5 factors or any individual facets of personality traits between Asian and Western candidates. High quality Big 5 personality tests can be used cross culturally as long as careful and reliable translations are used. Administering personality assessment tools provides value in the selection decision as long as the instruments are properly translated and reliabilities in the foreign language version tested in the same way as the English versions.
Personality, leadership competency and daily behaviour

WANG, Y. (The University of Sheffield), GRIFFIN, M. (University of Sheffield), LI, M. (ESC Rennes School of Business)

The aim of this study was to investigate the relationship among personality traits, daily behaviours and leadership competencies and to disentangle the process through which personality traits are translated into leadership competencies. Two personality instruments, Hogan Personality Inventory and Work Behavior Inventory, and one competency instrument, the SHL Universal Competency Framework (UCF) questionnaire were administered to 100 MBA students attending a leadership module. In addition, a diary study was carried out by distributing a daily behaviour questionnaire on eight days in a month. The results showed: (1) For both Chinese and non-Chinese MBAs, big five personality was found to well relate to conceptually relevant leadership competencies, suggesting that leadership characteristics are preceded by theoretically relevant personality traits. (2) Chinese and non-Chinese MBAs differ on several leadership competencies, especially the competencies preceded by extraversion trait. However, the prediction of personality on leadership competency did not appear to be different across the two groups. (3) Different patterns of relationship between personality and daily behaviours were found between Chinese and non-Chinese. Personality relates to the central tendency of daily behaviours much better in the non-Chinese group than in the Chinese group, suggesting Chinese are less traited and thus personality assessment may be less effective in predicting the daily behaviours of Chinese. (4) On task-related leadership competencies, personality traits translate into competency as mediated by daily behaviours. (5) The variability of daily behaviour appears as useful predictors, over and above trait and mean-level daily behaviour, on several leadership competencies. Specifically, higher scores on leadership competencies are predicted by lower variability on conscientious behaviour yet more variability on open behaviour. The following conclusions were made: (1) While Chinese may be more inclined to change their behaviours on a daily basis, their general leadership characteristics are as predictable as non-Chinese. (2) Daily behaviours contain useful information in predicting leadership competencies. The central tendency of daily behaviours may mediate trait-competency relationships, and the variability of daily behaviours may incrementally predict leadership competencies, over and above personality traits.

Defining Chinese leadership behaviors

TO, C. (Mobley Group Pacific), CHEUNG, F. (Chinese University of Hong Kong)

The present research examined Chinese leadership behaviors by adapting the behavioral complexity model developed by Quinn (1988) as a basic framework, and then integrating indigenous leadership concepts that are rooted in the Chinese culture. The exhibition of Moral Behaviors was considered salient to be integrated as "morality" has been a core concept of Confucius philosophy, which has been influential on a diverse range of Chinese social behaviors. The research was carried out first with two pilot studies to prepare the survey protocols. In the Main Study, completed survey questionnaires were analyzed on a valid sample of 152 senior executives at directorate level or above, including 22 CEOs and managing directors from organizations in Hong Kong and China; and their immediate superiors (N = 111) and at least two immediate subordinates (N = 334). Results suggested that Chinese leadership behaviors could be conceptualized as a constellation of five key aspects: The four aspects in Quinn's model, including Leading Change (focus on innovations and transformation of an organization), Producing Results (focus on goal accomplishment and task performance), Managing Processes (focus on efficiency of internal systems and procedures), Relating to People (focus on
commitment to human resources), as well as the indigenous aspect of Exhibiting Moral Behaviors (focus on moral righteousness as a person). In addition, different parties in the organization (executives themselves, their boss and subordinates) perceived similarly about the constellation of Chinese leadership behaviors. This extended leadership behavior framework will also be useful for future generation of assessment protocols for executive assessment and development in the Chinese work setting.

Assessment in the context of the International classification of Functioning, Disability and Health (ICF)

Chair(s): MPOFU, E. (University of Sydney), OAKLAND, T. (University of Florida)

Discussant(s): BIGGS, H. (Queensland University of Technology)

Assessment, and the purposes for which it intended is at its best when the outcomes from it can be interlinked to address activity and participation issues important to clients. The International Classification of Functioning, Disability and Health (ICF) provides a parsimonious framework for targeting assessments and interpreting the resulting evidence to inform intervention decisions and in language that makes sense to both the clients and also multidisciplinary teams of service providers. It also pushes to the fore the purposes for which assessment is being sought (or provided) in relation to real like outcomes such as to enable activity and participation in preferred settings. This symposium seeks to show case exemplary practices in the use of the World Health Organization’s (WHO) ICF to guide rehabilitation and health assessments. The key learning objectives of this symposium are: (1) Promote an understanding of the ICF model and its implications for rehabilitation services; (2) Promote an understanding of relationships between personal values and ICF’s participation; (3) Illustrate the utility of the ICF as a framework for assessing competencies in activities of daily living; (4) Explicate influences on participation for older community living women; (5) Foster an appreciation of the importance of qualifiers to the participation domain in using the ICF; (6) Identify factors that may influence test performance and/or alter the basic interpretation of findings.

Review of the International classification of Functioning, Disability and Health
Abstracts of the 27th International Congress of Applied Psychology

Symposia

OAKLAND, T. (University of Florida)

This presentation is intended to promote an understanding of the WHO’s International Classification of Functioning, Disability and Health (ICF), including its goals: to understand and study health and health-related conditions from a scientific base, establish a common language to facilitate communication, to compare reliable data internationally and over time, and to provide a coding framework for health information systems. The presentation will discuss the ICF model that views disability as multidimensional (at body, activity and participation/social levels) created by the interaction of health conditions together with personal and environmental qualities. These include eight body functions (e.g., mental, voice/speech, sensory/pain, skin, neuromusculoskeletal, cardiovascular, digestive, and reproductive functions) and eight structures (e.g., nervous, voice/speech, sensory, skin, movement, cardiovascular, digestive, and reproductive systems) as well as environmental (i.e., products and technology, natural and human-made environment, support and relationships, attitudes, and services and policies) and personal (e.g., one’s gender, race, age, education, religion, lifestyle, social background, and pattern of life experiences) factors. These conditions impact a person’s desired activities (e.g., tasks a person is able to perform) and desired participation (e.g., tasks a person does perform and that become integrated into one’s life). Activities and participation include the following nine domains: learning and applying knowledge, general tasks and demands, communication, mobility, self-care, domestic life, interpersonal interactions and relationships, major life areas, and community, social, and civic life. Implications for assessment in light of this model will be discussed. The ICF model offers a framework for describing human functioning dimensions that complement and extend purely diagnostic information. Information about one’s diagnosis or diagnoses coupled with information about functioning offer a multi-dimensional description of an individual’s current clinical picture and environmental factors that may buffer, exacerbate, or otherwise affect that picture. The ICF model allows mental health care practitioners to describe the whole health experience, including environmental factors, and to compare the experiences of patients with different conditions. The model also allows us to compare the experiences of a given patient over the course of his or her treatment.

The impact of personal values on one’s participation in the community among persons with chronic illness or disability

MPOFU, E. (University of Sydney)

The study examined community and independent living preferences among people living with a disability or chronic illness. These qualities exemplify International Classification of Functioning, Disability and Health’s (ICF) concept of participation. Successful community and independent living constitutes the quintessence of quality of life with a chronic illness or disability. Qualities of community living and independent living that are preferred by individual people with chronic illness and disability are unknown to rehabilitation providers yet are important for consumer-responsive rehabilitation services. Sixty-eight individuals who displayed various disabilities and chronic medical conditions completed an ethnographic study in which a free response procedure was used to nominate statements important to their community and independent living with a disability. Data were analyzed using concept mapping, a mixed method approach that is useful for constructing informant-oriented constructs about social reality and for constructing instruments that capture the substantive life experience domains that influence community and independent solutions for the informants. People with chronic illness or disability valued social inclusion and access and support policies for full participation. They also preferred roles that they contribute to the welfare of others in and serving as a resource to the community. The individuals with disabilities also valued family life in their community living options.
Efforts to promote participation through community and independent living of people with chronic illness and disability should address the values individuals seek to enact for a preferred quality of life. Ethnographic approaches are useful for constructing the components of participant-oriented domains of community and independent living with chronic illness or disability.

### Self-reporting of participation and environment: Can we make more use of Australia’s International classification of Functioning, Disability and Health (ICF)-related national data standards?

**MADDEN, R.** (University of Sydney)

This presentation discusses the value of basing self-reports of participation and environmental factors on Australia’s International Classification of Functioning, Disability and Health (ICF)-related national data standards. Methods that rely on self-report enable people to prepare to talk with service providers, evaluate services, reflect on their personal goals, and prompt for areas of importance requiring attention. The ICF provides four options for distinguishing activities and participation. A second set of qualifiers for activities and participation was used in the Australian data standards in an attempt to operationalise the fourth option, thus allowing all domains to be either activities or participation. The use of the qualifier ‘satisfaction with participation’ facilitated a summary of each person’s views about participation on a number of criteria. Preliminary testing suggested the use of these qualifiers has utility for purposes beyond those originally intended. The use of the qualifiers appears to have potential value in various settings. Further research on their use will provide evidence as to whether this qualifier concept can facilitate self-reporting of participation and for identifying related environmental facilitators and barriers.

### Measures of functional performance

**GRANGER, C.** (University of Buffalo), **GIILIESKI, M.** (Loma Linda University), **CARLIN, M.** (University of Buffalo)

The presentation demonstrates the usefulness of documenting and measuring change in functional abilities and measuring outcomes for patients in medical rehabilitation; and relates the clinical applications to the World Health Organization’s International Classification of Functioning, Disability, and Health (ICF). The basis for functional assessment is documenting functional change, guiding treatment, and estimating the types and amounts of care that must be provided by familial or hired caregivers, supportive devices, and environmental alterations. The continuum of care follows patients over time, and through various venues of care, in order to measure and manage outcomes and predict which types of patients benefit most in which settings at which times during their illness, and the duration of services and costs. A case study shows a stroke patient followed through inpatient and outpatient care, with functional findings compared with the ICF taxonomy. Application also is made of outcomes measurement to pharmaceutical testing and to projecting function of stroke patients during rehabilitation. The pharmaceutical research showed, using the FIM® instrument, that multiple sclerosis patients lost less function using an interferon β-1a drug. The research on stroke patients in an acute care hospital showed that the AlphaFIM® instrument could predict patient functional levels at admission to and discharge from a rehabilitation hospital. The stroke case study, using the LIFEwareSM System for outpatients, showed functional change over time and specific deficits to be addressed clinically, while mapping each functional deficit to ICF classifications. It has been a challenging process creating functional assessment instruments that describe motor and cognitive domains, in terms of level of competence in activities of daily living and pain. Functional status now joins medical status data, creating a complete profile of a medical rehabilitation patient’s strengths and
deficits related to his or her disability. Functional assessment will continue to be important for describing outcomes of patient care, particularly for persons with varying degrees of disablement secondary to chronic health conditions, especially as the U.S. population ages. Functional assessment ultimately will lead to interventions that may be targeted, and this will lead to better and more cost-effective care.

Can the international classification of functioning, disability and health (ICF) be used as a framework to explain falls in older Australian women?

MACKENZIE, L. (University of Sydney)

This study mapped the factors associated with falls risk in the Australian Longitudinal study of Women’s Health (ALSWH) cohort dataset and analysed them to empirically confirm relationships between international classification of functioning, disability and health (ICF) components. In a sub-group of 568 older women, items from five ALSWH surveys conducted from 1996-2005 were collected. ALSWH data consisted of a broad range of health information relevant to the ICF. Two occupational therapy (OT) researchers individually mapped these ALSWH survey items to the primary ICF components. Agreement between the raters was evaluated. The 10 linking rules by Cieza et al. and the eight updated rules by Cieza et al. were then used to link the data to the ICF. Results from both mapping exercises were compared and a consensus decision was made about the final linking of the items. Variables were longitudinally tested against the outcome of falls. Logistic regression model building processes were undertaken for all the defined components of the ICF. Four hundred and ten items were mapped across the surveys. The OT raters differed on the placement of only seven items. Differences were related to interpretations of activity and participation. Mapping using the 10 rules method allocated items differently due to personal factors not being classified and activity and participation being classified together. The ICF components of body functions, health condition, environmental factors, and the activity and participation component were significantly associated with falls. The personal factors component and the “not-covered” component did not contribute to falls in the final model. The mapping exercise was challenging to accommodate both the professional interpretations of the OT raters and the rules published for this purpose. The study demonstrated that the ICF can be applied to understand falls risk in a community sample of older women. However, the ICF categories need to be further developed in the definition of personal factors and environmental factors and a review of the distinction between activity and participation.

Attachment, empathy, values, and parental relationships and expectations in relation with prosocial behaviour and aggression in children and adolescents

Chair(s): RICHAUD, M. C (CIIPME - CONICET)

Prosocial behaviour and aggression are the outcome of multiple individual and situational factors. In this symposium the influence of attachment, parental practices, expectations and modeling, values, and prosocial moral reasoning over prosocial behaviour, empathy, aggression, and emotional stability, will be analyzed. The Symposium will begin with the study of the relations between attachment and proactive and reactive aggression in children 4 to 8 years old. We will then discuss the influence of children perceptions of parental practices, expectations, and prosocial behaviour on children and adolescent’s prosocial behaviour, and the links between prosocial moral reasoning in its different dimensions and the ability to build empathetic and prosocial relationships. Finally, we will present results which refer to the influence of parenting practices in prosocial behavior, aggression and emotional instability in children who experience poverty, and the value system, ethical positions and attitudes towards alcohol in adolescents and young adults aged 15 to 24 years old.

Proactive and reactive aggression in relation to children’s attachment

CARRASCO, M. A. (UNED)

This study examined the relations between children’s attachment and proactive and reactive aggression in order to improve proactive social adaptation. Sixty children ranging from 4 to 8 years old, and their mothers or care takers were recruited though childcare centers (n = 30) and a public school (n = 30). The attachment Behavior Q-Set and a story completion task were used to assess to attachment representations as well as cognitive, behavioral and emotional components of child’s attachment. A significant relation was found between attachment and aggression, however, reactive and proactive aggression were explained by different components of children’s attachment. The importance of studying different components of attachment rather than attachment as a one-dimensional construct in relation to children’s social adaptation will be discussed.

Keywords: attachment, reactive aggression, proactive aggression, social adaptation, children

Influence of parental practices expectations and modeling on children and adolescents prosocial behavior

RICHAUD, M. C. (CIIPME - CONICET)

Prosocial behaviour is the outcome of multiple individual and situational factors including parenting variables. Prior researchers have demonstrated that parental warmth and acceptance facilitates prosocial actions and that parental practices are positively related to prosocial behaviors (Carlo et al., 2007). Therefore, positive parenting styles (e.g., acceptance) and practices (e.g., use of social rewards) were expected to be positively associated with prosocial behaviours. However there is growing interest in identifying specific parenting practices, rather than assessing general interaction styles, to better predict social behaviours. The objective of this presentation is to study the influence of children perceptions of parental practices, expectations, and prosocial behaviour on children and adolescent prosocial behaviour. This study included a sample of 934 children and adolescents of varying levels of SES, aged 10 to 15 years from primary and secondary schools in Buenos Aires, Argentina. The measures were adapted for use with children and adolescents in Argentina and included: The Parent Expect Scale (Wyatt & Carlo, 2002), Parenting Practice Measure (PPM; Carlo, et al., 2007), and Prosocial Tendencies Measure (PTM-R) which includes: Public, Emotional,
Dire, Anonymous, Altruism, and Compliant dimensions (Carlo et al., 2003). The prosocial tendency that children and adolescents perceive in their parents, on the other hand, was studied through two questionnaires: one for mothers and one for fathers, with 21 items each, corresponding to the PTM-R 21 items but referred to parents. Multiple regression analyses indicate different effects of parental expectations, practices and modeling on children and adolescents different dimensions of prosocial behaviors. Further regression analyses will be conducted to examine whether these relations vary by SES, age, and gender. The principal influence between parental variables on children and adolescent prosocial behaviour is that of prosocial modeling, that is, rather than parents self-perceived prosocial behaviour, it is actually the prosocial behaviour that children and adolescents perceive in their parents that could really influence the development of their own prosocial behaviour. Furthermore, acceptance, mainly from the mother, is positively related to Anonymous and Altruism prosocial dimensions and negatively to public prosocial dimension.

**Keywords:** prosocial behaviour, parental practices, social behaviour, prosocial modeling, parenting

### Interaction between cognitive and emotional processes in prosocial disposition

MESTRE, M. V (Universitat de València)

Studies focused on the empirical evaluation of psychological processes related to prosocial development have highlighted the important part played by empathy as a factor of prosocial behaviour. An empathetic response includes the ability to understand others and share their emotional situation, this involving affection. Thus, empathy is comprised of both cognitive and emotional elements. Prosocial behaviour defines voluntary conducts aimed at helping others. Altruistic behaviour could be said to be prosocial but not the other way around. Prosocial behaviour focuses on the effects. We present the findings of an empirical study of an adolescent population. The aim is to analyse the links between prosocial moral reasoning in its different dimensions and the ability to build empathetic and prosocial relationships. The sample consisted of 1,557 Valencian adolescents aged 12 to 15 years (47% girls, 53% boys). They were all secondary school students from 36 schools in the province of Valencia. The results show higher empathy and prosocial behaviour levels in girls than in boys and prosocial behaviour values are higher in younger individuals. Positive correlations were found between empathy and prosocial behaviour, and both of these correlated with prosocial moral reasoning. In analysing the relevance of the relationship between moral reasoning and empathy variables or between moral reasoning and prosocial behaviour, we did not only find links between both variables but also significant negative connections of empathy with hedonist reasoning (approval-oriented), and positive ones with stereotyping. We also found negative links with aggression. Along the same lines, prosocial behaviour had significant positive links with reasoning in the following dimensions: internalisation, stereotyping, and needs-oriented. Similarly, negative ones were found for aggression. The findings support the relations between empathy, prosocial behaviour and prosocial moral reasoning. The "selfish" reasonings centred on the personal benefit (hedonistic reasoning) disable empathic disposition and facilitates the aggressive behavior.

**Keywords:** prosocial development, empathy, moral reasoning, prosocial behaviour, aggression

### The perception of parenting styles and its influence on prosociality, aggression and emotional instability in children in social vulnerability due to poverty

LEMOS, V. (CIIPME - CONICET)

The influence of parenting practices in the emotional and social development of children has been widely studied. The traditional model of socialization, which assumes that if the parents behave in a certain way the children perceive such conduct and internalize it, has proven to be insufficient in view of the fact that, in the internalization of parenting styles, the interpretation and the acceptance that the child possesses said messages plays an important role. The interpretation and acceptance will also depend on the parents-children relationship and how far the child
Abstracts of the 27th International Congress of Applied Psychology

feels he/she has participated in such relationship or if he/she feels the parents have imposed it. This is the reason why this study starts with the perception children have of parenting practices and assess the influence of such perception in prosocial behavior, aggression and emotional instability. The study was carried out in a sample of 269 children between 10 and 12 years of age both male and female, in four schools in the city of Buenos Aires and Paraná (Argentina). The children are in a context of vulnerability due to poverty in less supporting parenting styles that do not encourage prosociality, thus this is very important area to be studied. The following instruments were used: Argentine Scale of Perception of Relationships with Parents for 8 to 12-year old children (Richaud de Minzi, 2004), Prosocial Behavior Scale (Caprara and Pastorelli, 1993; Del Barrio, Moreno, & López, 2001), Emotional Instability Scale (Caprara & Pastorelli, 1993; Del Barrio, et al., 2001) and Physical and Verbal Aggression Scale (Caprara & Pastorelli, 1993; Del Barrio, et al., 2001). The results show how the perception of certain parenting styles, mainly acceptance or pathological control from the mother, influences both prosocial behavior and aggression, as well as the emotional stability of children. The predominant kind of parental style among groups at risk should favor, through negligence, punishment-based control and poor acceptance, a week prosocial behaviour and a high aggression and emotional instability. In view of the fact that the key factor of protection in families is the child’s perception of the availability of his parents’ emotional and instrumental support, when dealing with children at environmental risk it is crucially important to work with the parents.

Keywords: parenting practices, social development, prosocial behaviour, emotional instability, aggression

Social values, ethical positions and attitudes towards alcohol in adolescents and young adults

MORENO, J. E. (CIIPME - CONICET)

The aim of this paper is to compare the value system, ethical positions and attitudes towards alcohol in adolescents and young adults, grouped in the following categories: only study, only work, work and study, and neither work nor study. In recent years, the number of adolescents who quit school and do not find or look for a job has increased in our country. Furthermore, alcohol intake in youth and adolescents is becoming an issue of growing social concern in recent years. As a consequence, it is necessary to study the beliefs, values and attitudes of this population before developing preventive programs. This research comprises a sample of 350 adolescents and young adults from 15 to 24 years old, from both sexes. The instruments used were: Rokeach Value Survey, Ethical Position Questionnaire (EPQ) by D. Forsyth and Attitudes towards Alcohol (ACTICOL-92) by Pons Diez. To compare the differences among the four groups, we used the Multivariate Analyses of Variance (Manova) and the variance rank analyses (Kruskal Wallis). The main results showed that four groups have a high appraisal of family security. On the other hand, religious values are less ranked. The neither-work-nor-study group gives more importance to be obedient and less importance to be loving, intellectual and logical. Besides, they consider alcohol intake as a way of improving social relationships, and avoiding reality. The only study group and the work-and-study group are more ethical idealistic than the neither-work-nor-study group. No significant differences were found between the neither-work-nor-study group and the other groups as we would expect.

Keywords: alcohol use, adolescents, social relationships, values, attitudes
Automated e-Interventions

Minimal contact public health e-interventions for depression and anxiety

GRIFFITHS, K. (ANU)

There is a rapidly growing body of research demonstrating the efficacy of e-mental health programs when delivered within a controlled research context. This paper describes two open access automated therapy programs, MoodGYM and e-couch, the evidence for their efficacy across a range of settings, and the factors which predict user outcomes including the effect of minimal versus no contact. A systematic presentation of the data from a series of trials of the effectiveness of the programs undertaken in different settings and under varying conditions of support ranging from no tracking to minimal contact from lay interviewers. These programs are effective in reducing symptoms of depression and anxiety in a range of settings and contexts, for a range of ages, for both rural and metropolitan residents, and with and without minimal external support. Substantial public health gains can be achieved with the use of open access automated Internet mental health programs.

Keywords: e-mental health programs, depression, anxiety, Internet mental health programs

World wide wellbeing: Health promotion online

MITCHELL, J. (Monash University)

This session presents the results of a longitudinal study that tested the efficacy of two independent online positive psychology interventions (OPPIs) - strengths and mindfulness - to enhance wellbeing and reduce mental illness symptoms. The study included 623 adult participants (81% female, 70.5% Australian residents, mean age 39.9 years) in a randomised controlled trial investigating longitudinal outcomes for two positive psychology interventions (strengths and mindfulness) compared to a waitlist control (WC). Self-report measures were administered at baseline, post-intervention, one-month and three-month follow-up, and included the Personal Well-being Index-Adult, Satisfaction With Life Scale, Modified Differential Emotions Scale, Psychological Well-Being, Mental Health Continuum – Short Form, and the Depression Anxiety Stress Scale-21. Potential moderating variables tested included human support (via email) and baseline levels of well-being and depression symptoms. Hierarchical Linear Modelling analyses indicated that, compared to the WC, the Strengths group had significant average monthly increases, up to three months, on measures of well-being (PWI-A, mDES positive affect, PWB, MHC-SF). The Mindfulness group had a significant reduction in anxiety symptoms. Various moderating effects were found, for example, increased life satisfaction for Mindfulness group participants with elevated depression symptoms at baseline. The results support the efficacy of strengths and mindfulness OPPIs to enhance well-being and reduce illness symptoms. The moderating effects highlight the importance of tailoring interventions to the individual. The internet offers an opportunity to deliver fully automated, tailored interventions as part of an accessible and sustainable health promotion and illness prevention strategy.

The myCompass program for monitoring and managing mild to moderate depression, anxiety and stress

PROUDFOOT, J. (University of New South Wales)

The benefits of self-monitoring and self-help on symptom severity, coping and quality of life are well-documented. Historically, monitoring has been carried out using paper and pencil diaries, but retrospective recall biases and non-adherence reduce their validity. In Australia, 65% of individuals with mental health conditions do not access services and many instead are turning to self-care management practices. The Black Dog Institute has developed a program to assist individuals to self-monitor and self-manage mild to
moderate depression, anxiety and stress using their mobile phone. Take-up of mobile phones in Australia has reached saturation point in Australia, they are carried on the person, they are usually turned on and functionality is continually improving. The myCompass program enables ‘just in time’ monitoring of moods, events, medication and behaviours through the use of Internet and mobile technologies. People can choose at what time of the day they want to track their mood or behaviour, and whether they’d like to receive regular sms or email messages to prompt them. Users receive graphical feedback of their data, with situational information which helps them to identify patterns and triggers of their symptoms. They may also choose to receive brief interactive cognitive-behavioural strategies, as well as information and tips to help them manage depression, anxiety and stress. This paper will present preliminary findings from a pilot study testing the usability and potential effectiveness of the fully automated stand-alone digital tool. A pilot study involving 30 participants with mild-to-moderate depression, anxiety or stress was undertaken in January-February 2010. Individuals accessed the program on their mobile phone and/or computer for six weeks. Outcomes measures are the Depression Anxiety and Stress Scale, Work and Social Adjustment Scale and health service usage. The pilot study is still underway: results will be presented at the conference. myCompass offers a tool for psychologists and other healthcare professionals to use in their practice to assist clients to self-monitor and self-manage their symptoms and behaviour.

Bandwidth-fidelity dilemma and academic and job performance: Advocating narrow over broad traits

Chair(s): MUSSEL, P. (Universität Hohenheim)

Despite some recent controversy (Morgeson, Campion, Dipboye, Hollenbeck, Murphy, & Schmitt, 2007a, b), the use of personality tests to predict academic and job performance is widely accepted (Barrick, & Mount, 1991; Ones, Dilchert, Viswesvaran, & Judge, 2007; Tett, & Christiansen, 2007). However, in terms of the Big Five model of personality, validities are only small to moderate, compared with cognitive abilities. Recently, several authors advocated narrow over broad personality constructs to maximize predictive validity (Tett & Christiansen, 2007, 2008). For example, Rothstein and Goffin (2006) found eleven studies suggesting that prediction of job performance by use of narrow measures of personality is significantly higher, compared to broad measures. However, referring to the bandwidth-fidelity dilemma (Ones & Viswesvaran, 1996; Schneider, Hough, & Dunnette, 1996), this has been quite controversially discussed. The symposium presents several papers from different European countries investigating the utility of narrow facets, compared to broad traits, for predicting academic and job performance. While using different methodological approaches and focusing on different constructs and criteria, these papers suggest that future research should rather focus on the facet level.

Predicting academic success with the Big Five rated from different points of view: Self-rated, other-rated, and faked

DANAY, E. (Humboldt-Universität zu Berlin)

Self-ratings of personality incrementally predict academic success above and beyond general intelligence. The present longitudinal study aimed at replicating these findings and
investigating the possible predictive increment of the same ratings when made by others or when intentionally distorted. Research in this area often focuses on domain level scores of the Big Five and intelligence. In contrast, within this study facet scores were collected. Participants (N = 145) had to compile a personality questionnaire twice. At first they were given neutral instructions. The second time they were asked to imagine a specific applicant setting. Furthermore, two peers had to rate each participant. Additionally, verbal, numerical, and figural reasoning scores were obtained. Grades in a statistics exam obtained 2 months after the initial testing served as criterion. Results replicate prior findings and show incremental validity for self- and other-rated personality, which was stable after controlling for intelligence facets. Faking had no impact on Big Five domain score level but results on facet score level were less encouraging. The present study replicated and extended prior findings regarding the utility of personality facet self- and other-ratings as predictors of academic performance. It could be shown that each perspective contains specific variance neither shared with the other point of view nor with intelligence. With regard to intelligence it could also be shown that it can be advantageous to use facets instead of broader measures. Finally, the results demonstrate the necessity to investigate both criterion validity and faking effects on facet and not just domain level.

Keywords: personality, big five model of personality, intelligence, performance, personality traits

Predicting academic performance with personality facets: What role does the examination modality have?

ZIEGLER, M. (Humboldt-Universität zu Berlin), HEENE, M. (Karl-Franzens-Universität Graz), BÜHNER, M. (Karl-Franzens-Universität Graz)

Several studies have shown that using personality facet scores as predictors of performance yields better results than using domain level scores. However, so far little attention has been paid to which criterion is being used. In academic settings, oral examinations as well as written examinations can be distinguished. It is very plausible to assume that personality facets might have differential validities depending on the criterion. Therefore, a possible differential impact of personality domains and facets on academic performance (AP), depending on the examination modality (i.e. written vs. oral), was investigated in a longitudinal study. Three samples of German undergraduate students (N = 65 to 127) completed the NEO-PI-R. Within each sample the mode of examinations was either completely written or oral. Two years later their pre-degree grades were obtained. Results indeed support the idea of differential validities for some facets depending on the examination modus. For example, Extraversion and its facet Assertiveness emerged as significant negative predictors of oral performance, but did not predict written examination results. New evidence is provided that measures of personality facets outperform domain level scores. Furthermore, the importance of the criterion is highlighted.

Keywords: academic performance, personality, extraversion, personality facet, assertiveness

Does Openness predict Job Performance? Yes – on a Facet Level!

MUSSEL, P. (Universität Hohenheim), SCHULER, S. (Universität Hohenheim), WINTER, C. (Universität Hohenheim), GELLÉRI, P. (Universität Hohenheim)

Openness to experience, the fifth factor of the Big Five personality model, has shown to be uncorrelated with job performance (Barrick & Mount, 1991; Salgado, 1997). However, the internal structure of openness to experience is characterized by large heterogeneity. Based on a theoretical approach, it was predicted that certain aspects (or facets) of openness to experience are relevant for job performance, while others are not. The German version of the NEO-PI-R (Costa & McCrae, 1992) was applied to 395 persons participating voluntarily in the present research. Additionally, four different criteria measures were obtained, including peer-rating of job and academic performance, self-ratings of job performance, school performance, and academic success. Based on extensive internal and external construct validity analyses, we found internal structure of openness to experience to be
characterized by two sub-dimensions, which we labeled perceptual and epistemic, respectively. As expected, only the latter showed criterion-related validity (.21), while the former was negatively correlated (-.08). Regarding the bandwidth-fidelity dilemma, we found strong support for narrow over broad traits when predicting job and academic performance. We conclude that recent studies, while building on openness to experience as a broad trait, underestimated its utility for selection and assessment. Therefore, we conclude that future research should rather focus on the facet level. Regarding practical implications, measures of epistemic openness are recommended as predictors in personnel selection processes.

Keywords: openness, big five model of personality, job performance, academic performance, academic success

Differential validity of openness for experience facets and sub-dimensions

WINTER, C. (Universität Hohenheim), GELLÉRI, P. (Universität Hohenheim), SCHULER, S. (Universität Hohenheim)

Openness to experience is the most heterogeneous dimension of the Big Five (Digman, 1990). Recently it has been suggested that two sub-dimensions can be separated (Griffin & Hesketh, 2004) The present study investigates if our sample replicates those findings. To extend prior results of differential validities, openness sub-dimensions were correlated with a number of criteria from different areas of life, such as performance data and criteria reflecting recreation. These criteria were linked to openness sub-dimensions based on theoretical considerations. The openness to experience items from the German version of the NEO-PI-R (Costa & McCrae, 1992) was applied to 511 persons participating voluntarily in the present research. Additionally, a total of 35 different criteria (N = 46 to N = 473) were obtained via self-report. These criteria were independently rank-ordered by four experts regarding their relevance for openness sub-dimensions. As expected, exploratory factor analysis revealed a two-dimensional structure of openness to experience. Regarding external criteria, these factors showed largely differential validities. Differences in validities could be predicted by expert ratings of the criteria with 20 % explained variance. A differential view on the openness to experience factor seems promising as correlations to different criteria vary. While epistemic openness to experience was predictive for a wide variety of criteria, perceptual openness correlates mainly with criteria from the recreational area, like artistic hobbies. Regarding the bandwidth-fidelity dilemma, results of the present paper advocate the use of narrow facets compared to broad dimensions to maximize criterion related validity.

Optimizing the prediction of managerial success: Broad and narrow personality traits in the world of business

BERGNER, S. (Karl-Franzens-Universität Graz), NEUBAUER, A. C. (Karl-Franzens-Universität Graz)

Research concerning the relationship between personality and managerial success has been largely conducted within the framework of the Big Five personality traits. In contrast, the validity of narrow traits has not been adequately addressed. In the present longitudinal study we examine the extent to which narrow personality traits contribute to the prediction of managerial success beyond the Big Five. Moreover, we investigate whether the importance of narrow personality traits varies with respect to different criteria of managerial success. To this end, 140 managers provided personality data on the Big Five and five narrow-band personality traits empirically related to managerial success (i.e., Assertiveness, Leadership Motivation, Social Sensitivity, Conscientious Perfectionism, and Achievement Motivation). Eight as well as 20 months later managerial success was assessed. At both occasions managerial success was measured by income and promotion rate, supervisor ratings on contextual and task performance, as well as self-ratings of job satisfaction. Results suggest that narrow traits add incremental validity over and beyond the Big Five for income and supervisor ratings at
both points in time when criteria were assessed, yet the degree to which they contribute depends on the criteria used. However, no increase in validity was registered for job satisfaction and promotion rate. The present study supports the validity and utility of personality traits for future managerial success. Moreover, the results not only augment research demonstrating that narrow traits can substantially optimize the prediction of real-life criteria but also indicate that the degree to which they contribute varies for each trait and each criterion. However, the duration between predictor and criterion measurement does not influence the incremental validity of narrow traits.

**Best practices in testing and feedback training for development in a diverse global world**

Chair(s): ELLIOTT, R. (MLQ International)

Discussant(s): HESKETH, B. (University of Western Sydney)

This symposium presents seasoned practitioners, authors and researchers from the United Kingdom, China and Australia who have worked extensively on testing standards, psychometric tests, assessor training and coaching for development in different geographical locations around the globe. Challenges in conducting assessments, interpreting data, delivering feedback and establishing goals for development will be discussed along with issues defining best practice in assessor and coach training in different cultural contexts. Psychological assessment tools can contribute to the effective identification of talents and competency characteristics predictive of outcomes for effective organisational functioning. Assessors and those concerned with the identification and development of talent have to possess relevant knowledge and skills and be able to recognise the implication of assessment data on talents’ competency, work performance, and likely improvement goals for on-going development. It is critical for assessors to build their savvy in leveraging global best practices in testing and feedback with an appreciation of the local business contexts, standards requirements and cultural sensitivities in talent assessment and development. The Learning objectives for this symposium include: To inform psychologists of current Chinese, Australian and international approaches to developing and implementing standards in psychological testing for effective individual and organisational performance; To provide perspectives on best practices, directions for continuous enhancement of standards, and training requirements for professionals in diverse world contexts; To learn
about available professional standards of psychological testing across different regions in Greater China (Mainland China, Hong Kong, and Taiwan) and challenges in using different types of psychological assessments in the Chinese work setting; To advance practice in leadership development through the integration of empirical leadership knowledge and psychometric assessment with current coaching practice and theory; To inform and stimulate psychologists' awareness of important ethical issues associated with internet testing which have been given less consideration to date; and to highlight the necessity of conducting in depth qualitative and quantitative psychological research into developmental applications of psychometric instruments. This symposium will be of interest to those involved in the review of testing standards, psychometric testing training, and the utilisation of empirical knowledge for talent development in a diverse yet interconnected global world.

**Professional standards in using psychological tests in Greater China: Present and future.**

TO, C. (Moberly Group Pacific, Hong Kong)

The use of psychological assessments gains increasing popularity in the work setting of Greater China. Users are typically hiring managers and human resources professionals with diverse educational backgrounds and career experiences. Yet there lacks concerted efforts in aligning professional standards across different regions of Greater China, namely Mainland China, Hong Kong, and Taiwan for users to make reference to. The present paper attempts to compare and contrast the professional standards of psychological testing across these different regions. The study would be carried out with desktop research on available ethical principles and code of conducts from Mainland China, Hong Kong, and Taiwan. Critical aspects would be benchmarked with the available information from other overseas authorities such as APA, BPS, and APS. Interviews would be conducted with the professional governing body and corporate users to solicit their perspectives towards the challenges in the professional use of psychological assessments in each of the locations. Issues related to confidentiality, data interpretation, and intellectual property protection, will be discussed in the context of Greater China. Challenges that users face when using different types of psychological assessments in the Chinese work setting, including aptitude tests and personality tests, will also be highlighted. This paper will shed light on best practices, directions for continuous enhancement of psychological standards, and training requirements for the professionals involved in the use of psychological testing in Greater China.

Keywords: psychological assessment, professional standards, confidentiality, aptitude testing, personality tests

The development and maintenance of Australian standards for test development and use in a burgeoning internet testing industry.

ALLWORTH, E. (Allworth Juniper Organisational Psychologists, Sydney)

Recent years have seen a proliferation of tests, test publishers and test users, spurred on by the expanded access afforded by the internet. Psychologists can no longer claim psychological testing as their protected domain. On the contrary, psychological tests are now a valuable commodity in a burgeoning, and largely deregulated, industry that is characterised by vast discrepancies in quality and standards of test development and use. This paper examines approaches to standardisation and regulation of occupational testing internationally and explores the extent to which current models are applicable and sufficient for the Australian context. More specifically, the review focuses attention on potential threats to ethical practice posed by internet testing. This paper is based on a broader review of international approaches to setting standards for tests and test use. The findings are evaluated in the context of the current debate in Australia - stimulated by the introduction of the new National Registration and Accreditation Scheme (NRAS) due in July 2010 - around the regulation of psychological testing and, more specifically, the ethical implications of internet testing. The review highlights some threats to ethical practice in
internet testing that require greater attention in the setting of testing standards. These relate to: (1) the entry of internet test publishers into the psychologist-client relationship through their access and storage of confidential client test data in their proprietary databases; (2) test users’ access to client test data, particularly raw scores; and (3) test users’ access to technical information about the psychometric properties of internet tests to enable psychologists to evaluate the tests they use while also protecting the intellectual property of test publishers. The nationalisation of psychologist registration and accreditation in Australia provides an opportunity for the implementation of a system that raises standards of tests and test users to the benefit of the community. The establishment of these standards needs to give due consideration to the unique features of internet testing that have undermined psychologists’ access to test data and have threatened their ability to provide an ethical and confidential service to their clients.

Keywords: internet testing, professional standards, standardisation, occupational testing, ethical practice

Getting the balance right: Utilising psychometric assessment inputs and evidence based theories in the coaching ‘reflective space’ for leadership development.

ELLIOTT, R. (MLQ International, Melbourne)

Discussions within the emergent Coaching Psychology literature often focus on the practice of leadership development. Yet this domain within psychology continues to be disconnected from the considerable empirical literature about leadership and leadership assessment. Similarly, the scientific leadership literature has only recently begun to focus on how leadership is developed. Likely reasons for this include premature domain self-limiting assumptions and restrictions on how scientific knowledge itself progresses. However, this lack of literature cross-engagement is brought into sharp focus for professional leadership development coaches. Recognition of this separation brings an imperative for applied psychology to achieve comprehensive integration in leadership development. This entails review of current knowledge domain boundaries, techniques, skills and relevant ethical principles and practices. The conceptual framework for the ‘coaching reflective space’ was presented by Elliott (2007) following systematic client coaching case study analyses and naturalistic participant-observer reflections on actual coaching practice. These methods are extended to include observer review of coaching processes to incorporate scientifically established leadership theories and an examination of necessary associated ethical practices. Additionally, description and review is made of the utilisation of psychometric leadership assessments, such as the MLQ360, to achieve integrated adopted coachee goals informed by such scientific theories. The conceptual framework for the reflective space, extended to leadership assessment and development, provides a cognitive organiser for the systematic utilisation of salient knowledge domains, information inputs and processes within the complex coaching relationship. It demonstrates how evidence based leadership theories, such as the transformational-transactional theory; inform coachee goal attainment without diminishing coachee self-actualisation. It describes and contextualises necessary coach-managed expert and facilitative modalities, and associated ethical transitions, to establish, maintain and bound the reflective space. This paper redefines required parameters in coaching for leadership development (Elliott, 2005) through an extended conceptuality for the coaching reflective space. By proposing a more comprehensive model for leadership coaching it provides guidance for good practice in test utilisation for facilitators and trainers. As a crucible for integration and innovation the conceptual framework for practice itself provides an evaluation point for current coaching and leadership scientific literatures. Suggestions for further research are made.

Keywords: coaching, leadership development, assessment, ethical practice, self-actualisation

Underpinning best testing practice by combining qualitative and quantitative methods
MCDOWELL, A. (University of Surrey)

The aim of this paper is to develop methods for bridging the gulf between psychological research and the way that psychological tests are being used in organisational practice, with particular reference to a cross-cultural context. Much work in testing is purely numbers driven, however this presupposes that relevant constructs and measures need no passport and can indeed be understood and interpreted by considering numbers alone. Whilst such studies are clearly needed to further our understanding, we argue that they need to be augmented by qualitative techniques. The latter are particularly valuable when considering approaches that do not lend themselves to traditional techniques such as factor analysis, locally developed competency based indicators or frameworks are one example. This paper will first present a qualitative synthesis of existing research on testing to demonstrating how we lack an evidence base in particular for developmental applications of testing. This review will be augmented by the integration of existing research, one cross-cultural comparison and one case study investigating leadership in a SE Asian context. Findings demonstrate that whilst at face value psychometric constructs may appear to travel across borders, interpretations and understanding on part of test takers and end users appear to have subtle differences. The content of this paper has implications for test use and interpretation. Qualitative techniques such as focus groups and interviews offer a rich but robust approach to initial validation, that allow better definition of the 'criterion space' (Bartram, 2005), and there is a need to bring relevant research into the psychological domain particularly when considering test use contexts such as leadership development. Finally, we will make the link to emerging test use contexts such as coaching, integrating our recent work on developing guidance for best practice (Smewing & McDowall, 2009; McDowall & Smewing, 2009).

Keywords: psychological research, psychological testing, cross-cultural, leadership, validation

**Big-fish-little-pond-effect: Effects of ability grouping on academic self-concept**

Chair(s): DUMAS, F. (Aix-Marseille University and CNRS)

Central to this symposium is the "Big-Fish-Little-Pond-Effect" (BFLPE) indicating the power of students’ local frame of reference (schools or classes) to form their academic self-concepts (ASCs; see Marsh, & Parker, 1984). According to this effect, equally able students have lower ASCs when attending schools or classes where the average ability levels of classmates is high, and higher ASCs where the average ability is low. Just like most research in this area, the present symposium includes speakers from various countries, namely, Australia, England, France, Hong Kong, United States, and Singapore. First speaker presents the theoretical and methodological foundations of the BFLPE, state of the arts research focusing on the external validity of this effect based on cross-cultural comparisons, and practical implications for parents and teachers. The second speaker examines potential moderators of the BFLPE including individual ability, cognitive and metacognitive learning strategies, motivational orientations, and individual preferences for the learning environment. Consequences on streaming to relationship with parents, stress, and others well-being factors are also discussed. The third speaker further examines the BFLPE in the contexts of gender and ethnicity; and also whether student differences in motivational goals, academic engagement dimensions, and basic value orientations reduce or exacerbate the BFLPE. To answer Dai and Rinn's (2008) criticism that forced social comparison is only inferred and deliberate upward social comparison ignored in the context of the BFLPE, the fourth speaker shows recent data clarifying the role of these two types of social comparisons in this context, their respective influence on academic performances, and underlying motivational dynamics. Finally, the fifth speaker gives an overview of recent advances in self-
concept theory and research to demonstrate the pervasive significance of the self-concept construct for multiple educational interventions.

**Big-fish-little-pond-effect: Effects of ability grouping on academic self-concept**

MARSH, H. (University of Oxford, UK)

The big-fish-little-pond effect (BFLPE) predicts that equally able students have lower academic self-concepts (ASCs) when attending schools or classes where the average ability levels of classmates is high, and higher academic self-concepts (ASCs) where the average ability is low. Because of the importance of ASC in predicting future achievement, coursework selection, and educational attainment, the results have important implications for the ways in which schools are organized (e.g., tracking, ability grouping, academically selective schools, gifted education programs). I briefly summarize minimal conditions and alternative tests of the BFLPE, and its theoretical, empirical, and policy-related implications. Special attention is given to the effects of ability grouping in relation to both gifted and learning-challenged students, and to the theoretical juxtaposition between the BFLPE and social comparison theory. Based extensive research, BFLPE findings are remarkably robust, generalizing over a wide variety of different individual, classroom, and school characteristics, settings, countries, long-term follow-ups, and research designs. Studies with the all three OECD-PISA databases (large, nationally representative samples of up to 57 countries) show the cross-cultural generalizability of the BFLPE. Interactions between the BFLPE and potential moderators are consistently very small or not statistically significant. The most widely studied potential moderator is individual student ability, but the BFLPE generalizes well over different student ability levels. The BFLPE is stable and long-lasting; the negative effects of attending academically selective schools on ASC increase the longer a student remains in the same school, and show no diminution two or four years after high school graduation. Although the BFLPE refers specifically to effects on ASC, there is a growing body of research demonstrating negative effects of school-average ability on other important outcomes (e.g., achievement, coursework selection, academic aspirations) that are mediated in part by ASC. BFLPE research represents a methodological-substantive synergy in which new and evolving statistical approaches are applied to substantively important issues with significant implications for policy and practice. I conclude with a review the methodological developments in BFLPE research, leading to new multilevel structural equation models, unresolved issues and directions for further research.

Keywords: big-fish-little-pond effect, self-concept, schools, gifted students, learning-challenged students

**The big-fish-little-pond effect: An Australian story**

SEATON, M. (Centre for Educational Research, University of Western, Sydney)

Big-fish-little-pond effect (BFLPE) research has demonstrated that academic self-concept is negatively affected by attending high-ability classes and schools. The current paper aimed to describe BFLPE research that has been undertaken in Australia. It began by describing some of the early Australian BFLPE research undertaken by Marsh and colleagues and continued by detailing two new Australian studies. The first of these studies examined whether the BFLPE for Australian students could be reduced, or was exacerbated by, a variety of individual difference constructs. The main aim of the second study was to measure how different schooling settings (academically selective and non-selective) impact on students both academically and psychologically. Participants in the first of these studies were 15-year-old Australian students who took part in the Program for International Student Assessment (2003; N = 12,383). Using multilevel modelling, eight BFLPE moderators were examined. These included individual ability, cognitive and metacognitive learning strategies, motivational orientations, and individual preferences for the learning environment. The second study discussed in the current paper concerned an ongoing study in eight NSW high schools. Participants attended either one of two academically
selective high-ability schools \((n = 734)\), or one of six comprehensive mixed-ability schools \((n = 2,048)\). A range of psychosocial wellbeing factors was examined, including relationships with parents, depression, stress, and pressure to achieve. In the first study, although statistically significant moderating effects were found for some of the individual difference constructs, they were not considered to be of practical importance in light of the large sample size. Regarding the second study, preliminary results from the first time wave indicated that there were no differences between students from the high-ability and mixed-ability schools in depression or stress. However, students from the high-ability environment reported worse relationships with parents and more pressure from parents to perform well at school. In the first study, results suggest that in Australia the BFLPE is reasonably consistent and generalises across the specific student characteristics examined. Preliminary results from the second study suggest that parental relationships are an important avenue to pursue in BFLPE research and in future intervention strategies.

**Islands in the stream and streams in the island: Ability streaming and the big-fish-little-pond effect in Singapore**

LIEM, G. (University of Sydney), MCINERNEY, D. (Hong Kong Institute of Education), YEUNG, A. (National Institute of Education, Singapore)

The study aimed to examine: (1) the big-fish-little-pond effect (BFLPE) as a consequence of ability-streamed classes (high-ability, middle-ability, and low-ability streams – a system-wide educational practice in Singapore) on academic self-concepts (ASC) in English and math; (2) the BFLPE in the contexts of gender and ethnicity; and (3) the role of student differences in motivational goals, academic engagement dimensions, and basic value orientations in moderating the BFLPE. The participants were 4,949 lower and middle secondary students from 11 public schools in Singapore (46% girls; mean age = 13.95). English and math self-concepts were measured by the Self-Description Questionnaire-II (SDQ-II; Marsh, 1992). Students’ Primary School Leaving Examination scores in English and math were used to construct indicators of individual student abilities and context-average achievements in the two subjects. Other established instruments with strong cross-cultural validity evidence were used to measure motivational goals, engagement dimensions, and values. Multilevel modeling analyses were performed using MLwiN 2.13 to address the study objectives. Consistent with the BFLPE and controlling for individual student ability, placement in a high-ability stream led to lower ASCs and placement in a low-ability stream led to higher ASCs. As expected, in an educational context that implements a nationally similar ability-streaming practice across its secondary schools, stream-average achievement effects on ASCs overshadowed those of the school-average achievements. Consistent with prior studies, interaction effects between the BFLPE and motivational goals, learning engagement dimensions, and value orientations were generally small or not statistically significant, and did not protect students against the BFLPE. There was no evidence that students systematically compared their achievements with those in their respective streams who are of the same gender or ethnicity. Consistent with the BFLPE, differentially significant effects on ASCs are associated with placement of students in low-ability and high-ability streams. These effects were largely consistent on students’ English and math self-concepts. The BFLPE also generalizes well across students with different levels of motivational goals, learning engagement, and basic value orientations. There was no evidence for the BFLPE specific to the contexts of gender and ethnicity.

**Upward social comparisons: Angel or devil? On the opposite effects of forced and deliberate comparisons in the context of the BFLPE**
DUMAS, F. (Aix-Marseille University and CNRS), HUGUET, P. (Aix-Marseille University and CNRS), SULS, J. (University of Iowa, US)

It is generally assumed that forced upward comparisons with classmates play a causal role in the BFLPE. At the same time, studies on role models substantiate the importance of deliberate upward comparisons as sources of motivation with positive effects on self-efficacy feelings and achievement. The first aim of this research is to examine the respective effects of these two basic types of social comparisons on the BFLPE and academic performances. Our second objective is to explore the motivational dynamics (based on achievement goal theory) possibly associated with deliberate upward comparisons that had been largely overlooked in theory and research on the BFLPE. A distinction is made between two types of social comparison: How students compare with most others around them under the pressure of the environment (forced comparison) and with whom they prefer to compare in this environment (deliberate comparison). Multilevel modeling analyses on French data were performed using HLM 6. As expected from research on the BFLPE, social comparison with the entire class mediated this (contrast) effect, indicating that it is indeed based on forced upward comparisons. As expected from research focusing specifically on social comparison processes, our data also show that deliberate upward comparison—a common practice in class—is driven by a desire to learn, and has beneficial (assimilative) effects on both academic self-concept and performances. Beyond the relatively uncontrollable social comparisons underlying the BFLPE, students exercise considerable choice over the target with which they compare themselves, mostly upward comparison targets with positive effects on self-perceived ability and behavior. As suggested by Wheeler et Suls (2005): "Probably every social comparison creates both the pull of assimilation and the push of contrast. Which process predominates depends on the person's degree of freedom and flexibility to make strategic comparisons."

The present findings also contribute to the debate about the practical implications of the BFLPE. Although this effect may lead to the conclusion that upward social comparisons should be discouraged, our data teach us that this conclusion does not apply to those in which students engage deliberately.

Why self-Concept matters and examples from bullying, peer support, reading, and mathematics research

CRAVEN, R. (Centre for Educational Research, University of Western, Sydney)

There is a revolution sweeping psychology that emphasizes a positive psychology and focuses on how healthy, normal, and exceptional individuals can get the most out of life. Self-concept has been established as one of the most important constructs in of itself in the social sciences and as fundamental to psychological wellbeing. Self-concept is one of the most important constructs in education and as such many educational policies around the world advocate the development of positive self-concepts as an important outcome of schooling. Self-concept has also been demonstrated to be an important mediating factor that facilitates the attainment of other desirable psychological, behavioural and educational outcomes that underpin human potential. For example, a body of rigorous international research has demonstrated that self-concept shares a reciprocal, mutually reinforcing, causal relation with achievement and other desirable educational outcomes (see Marsh & Craven, 2005; 2006 for an overview). Yet the implications of these recent advances for effective educational interventions have not been fully elucidated. My thesis is that effective educational interventions need to include the enhancement of relevant self-concepts alongside the content, skills, and strategies delivered in intervention programs. The primary purpose of this presentation is to identify the centrality and implications of the self-concept construct for the development, implementation, and evaluation of effective educational interventions. The study showed, firstly, an overview of recent advances in self-concept theory and research is presented. Secondly, findings from example self-concept research studies in bullying, peer support,
reading, and mathematics are presented to identify best practice and important directions in research and development in these fields and to demonstrate the pervasive significance of the self-concept construct for multiple educational interventions. Finally, based on a synthesis of the findings, the implications of this body of research for developing, implementing, and evaluating effective educational interventions are discussed.

Keywords: positive psychology, Self-concept, psychological wellbeing, educational interventions, bullying

### Both sides of the coin:
consequences of constructive leadership and antecedents of destructive leadership

Chair(s): ADRIASOLA, E. (UWA Business School/ The University of Western Australia)

Discussant(s): DAY, D. (The University of Western Australia)

Five leading researchers from three different countries (Greece, Netherlands, Australia) come together to provide an overview on current leadership research. Two sides of the coin are tackled here starting with four papers exploring consequences of constructive leadership (transformational leadership, ethical leadership, leader-member exchange) and exploring different mediators and moderators for these relationships. However, leadership is not always constructive; the symposium therefore closes with an exploration of antecedents of destructive leadership (laissez-faire and abusive supervision). The first set of papers examines outcomes that may help to explain the “black box” between constructive leadership and performance. The first paper presents a cross-cultural study (including seven countries) which examines the mediating roles of flow and family-work conflict in the relationship between leader-member exchange and career success. The second paper provides further explanation for the relationship between transformational leadership and self-concordance by first exploring the leaders’ behaviours associated to the goal setting and the attributes of these set goals and second, by applying the goal hierarchy approach to the self-concordance construct. The third paper presents two multi-source studies looking at the relationship between ethical leadership and follower organizational citizenship behaviours and one contextual factor moderating this relationship: job autonomy. The fourth paper – closing the constructive leadership section – explores the effect of transformational leadership on transfer of training by combining both the theory of
planned behaviour and self-determination theory; it reports how the paths through attitudes, subjective norms, perceived control and autonomous motivation further explain this type of leaders’ effect on transfer of training over and above supervisor’s support and training climate. Destructive leadership is explored in the last paper presented in this symposium, which identifies the direct and indirect effects of dispositional antecedents (neuroticism, agreeableness and conscientiousness) for laissez-faire leadership and abusive supervision. Furthermore, this paper reports the socio-cognitive mediating effects of leader self-efficacy, affective motivation to lead and control appraisals. The discussant is one of the top leadership researchers currently in the world. He will draw together the themes and implications from the symposium. Overall, this symposium presents strong theoretical and empirical contributions to our understanding of both constructive and destructive leadership.

The mediating role of flow and family-work conflict in the relation between leader-member exchanges (LMX) and career outcomes

EPITROPAKI, O. (Alba Graduate Business School)

The role of Leader-Member Exchanges (LMX) for employee subjective and objective career success has been highlighted by previous studies (e.g., Erdogan et al., 2004; Seibert et al., 2001). The present cross-cultural study offers additional insights by exploring the role of employee perceptions of flow and family-work conflict in the relation between LMX and career outcomes. Flow is a state of consciousness where people become totally immersed in an activity and enjoy it immensely. When flow is applied to the work settings it is defined as “a short-term peak experience at work that is characterized by absorption, work enjoyment and intrinsic work motivation” (Bakker, 2005, p.27). Employees who enjoy their work and feel happy tend to make a more positive judgment about the quality of their working life, be more creative and show more initiative at work. We therefore suggest that flow will be an important predictor for employee career outcomes, a relation that has not been explored by previous studies, and that it will further mediate the relationship between LMX and career success. We also explored the role of family-work conflict in the relation between LMX and career outcomes. Family-work conflict (FWC) refers to a situation in which role pressures at home interfere with functioning at work (Greenhaus & Beutell, 1985). Few prior studies (e.g., Nikadrou et al., 2008) have explored the relation of FWC and career success and have shown FWC to be a significant predictor for career outcomes. Our sample consists of 588 supervisor-employee pairs from seven different countries (UK, Netherlands, Germany, Italy, Greece, Sweden and Poland) employed in the ICT sector. Structural equation modelling analyses have shown employee-rated LMX to be a significant predictor of subjective career success as well as one aspect of objective career success, i.e., bonuses and earnings beyond base salary. Supervisor-rated LMX was a significant predictor for all objective career outcomes. Our results further suggested that flow mediated the relationship between employee-rated LMX and subjective career outcomes, whereas FWC mediated the relationship between supervisor-rated LMX and objective career outcomes. Furthermore, the results were found to be generalizable among countries.

Keywords: leader-member exchange, flow, family-work conflict, career outcomes

Leadership’s effect on motivation: understanding the mechanisms through which transformational leaders affect self-concordance

ADRIASOLA, E. (UWA Business School/ The University of Western Australia)

Motivation continues to hold the attention of much of the research done in industrial-organizational Psychology as it remains as one of the most decisive factors influencing performance. It is generally recognised that leaders play a key role in affecting their followers’ work motivation; however, there are still gaps in our knowledge about the processes and mechanisms by which this occurs. Zaccaro and colleagues (2008) proposed that leaders enhance an individual’s work clarity and
commitment, which in turn facilitates psychological conditions for consequent motivational processes and states. In other words, leaders motivate their followers by clearly specifying the tasks, the goals, the expected performance standards, and the available resources (Bass & Bass, 2008; Conger, 1999; Zaccaro, et al., 2008), thus allowing a clear and specific goal setting process (Drafke, 2006; Foster, 2000; Locke & Latham, 1990). In addition, transformational leaders affect their followers’ goal commitment by promoting self-concordance (Bass & Riggio, 2006; Shamir, House, & Arthur, 1993; Zaccaro, et al., 2008). Bono and Judge (2003) reported a pioneering study investigating the effects of transformational leaders on self-concordance at work. They contributed to the understanding of the motivational effect of transformational leadership by providing evidence that the behaviours of these leaders influenced employee’s self-concordance. However, their conflicting findings on the nature of motives prompted by transformational leaders and, the inconsistent results on the mediating effect of self-concordance on the relationship between transformational leadership and performance, suggests that the relationship is more complex than originally anticipated. Thus, in this paper I will provide preliminary data to further understand how this relationship works. More specifically I will first present qualitative data that explores the relationship between self-concordance and the attributes of goals set by transformational leaders and the leaders’ behaviours associated with goal-setting. Second, I will develop the construct of self-concordance beyond simply autonomous/controlled motives by approaching it from a goal hierarchy perspective and explore how this theoretical development helps to explain the leader-self-concordance relationship. Finally, I will present preliminary quantitative results from a sample of teachers and engineers testing two potential neutralizers of transformational leadership on self-concordance, namely, vocational centrality and leader-member exchange.

Keywords: motivation, performance, goal setting, transformational leadership, self-concordance

How and when does the ethical behavior of leaders affect follower organizational citizenship behavior?

DEN HARTOG, D. (Amsterdam Business School/ Universiteit van Amsterdam)

This paper presents two multi-source studies addressing the relationship between ethical leadership and follower organizational citizenship behavior (OCB). Based on social learning and social exchange theory, we propose several reasons why ethical leader behaviour is likely to positively relate to follower OCB. In two related studies, we first test this relationship then try to develop more detailed insight into when this relationship holds. We developed and validated a measure of overall ethical leadership that is composed of seven different ethical leader behavior scales (fairness, integrity, ethical guidance, people oriented, power sharing, role clarification, and concern for sustainability) and in the first study among supervisor-employee dyads, we show how both overall ethical leadership and these different ethical leader behaviours (subordinate rated) relate to different forms of OCB (supervisor rated). Overall, we find low but positive relationships and fairness and power sharing were especially relevant in relation to OCB. Next, we ask when the relationship between ethical leadership and OCB occurs. We propose that employees are more likely to need the ethical guidance of leaders in context that allow them to choose alternative ways to act (i.e. high autonomy contexts). Thus, in the second study we investigated the moderating role of job autonomy in the relationships between overall ethical leadership (subordinate rated) and different forms of OCB (supervisor rated). In line with expectations, a study of supervisor-follower dyads demonstrated that perceived job autonomy moderated the relationships of ethical leadership with OCB such that this relationship is positive when job autonomy is high, but not significant when job autonomy is low. Overall, our findings indicate ethical leadership relates positively to follower OCB, but that moderators such as autonomy do affect this relationship and that we need to know more about the role of the context in ethical leadership.
The role of transformational leadership in the transfer of training

PATAH, S. (UWA Business School/ The University of Western Australia)

Transfer of training research has identified a range of factors that affect the extent to which trainees perform the trained skills and knowledge at the workplace (see Cheng & Hampson, 2008; Colquitt, LePine & Noe, 2000). These factors are related to training design (e.g. training usefulness), individual characteristics (e.g. personality; motivation; ability), job variables (e.g. job involvement; organizational commitment); work environment of the employees (e.g. transfer climate; supervisory support); and motivation (e.g. motivation to learn; motivation to transfer). Despite this wide-ranging literature, very little research has examined the role of the leader in the transfer process. Surprisingly, the only research that has looked directly at leadership has focused solely on supervisors’ support (e.g. Cromnell & Kolb, 2004). However, in the leadership literature, the positive effect of transformational leadership on followers’ job attitudes and behaviour has been substantially documented (e.g. Bono & Judges, 2003). Thus, we propose that transformational leadership will influence the trainees’ intention and willingness to transfer learned skills back to workplace over and above the effect of supervisor support. We develop a model that incorporates two widely-supported social psychological theories of behaviour change: Theory of Planned Behaviour (TPB; Ajzen, 1991) and self-determination theory (SDT; Deci & Ryan, 2000). We hypothesize that transformational leadership will influence trainees’ attitudes, subjective norms, perceived control, and autonomous motivation to transfer the training which will affect their transfer intentions and behaviour. It is also hypothesized that the four components of transformational leadership, namely individualized consideration, idealized influence, inspirational motivation, and intellectual stimulation will have differential effects on these variables as well as on existing training transfer variables such as supervisor support and training climate. To date, no study has incorporated the theories of transformational leadership, TPB and SDT in a model of training transfer. The hypothesized model will be tested on a sample of 250 professional and managerial employees undertaking a series of leadership training programmes and preliminary results will be discussed.

Keywords: transfer of training, transformational leadership, intention, theory of planned behaviour, self determination theory

The dispositional antecedents and socio-cognitive mediators of abusive supervision and laissez-faire leadership

RAFFERTY, A. (Australian School of Business/ The University of New South Wales)

A growing body of research is exploring the role of dispositional antecedents of constructive leadership (e.g., Lim & Ployhart, 2004; Walumba & Schaubroeck, 2009). For example, individuals high in positive affectivity are more likely to engage in transformational leadership behaviours. In contrast, extraversion has been demonstrated to provide a clear benefit to leaders who also possess the ability to accurately recognize emotions (Rubin, Munz, & Bommer, 2005). More complex relationships have also been demonstrated with authors such as Ng, Ang, and Chan (2008) reporting of a sample of military recruits from Singapore, that leader self-efficacy mediates relationships between three leader personality traits and leader effectiveness. Specifically, leader self-efficacy mediated the effects for neuroticism and conscientiousness on leader effectiveness when leaders had high rather than low job autonomy. Although these studies increased our understanding of the dispositional characteristics that are likely to facilitate constructive leadership, we know very little about dispositional antecedents associated with destructive leadership such as abusive supervision (Tepper, 2000), or laissez-faire leadership (Skogstad, Einarsen, Torsheim, Schanke Aasland, & Hetland, 2007). By taking a dispositional approach, we closely examine the personality configuration of leaders who
engage in these types of behaviours. In this study, we developed and empirically tested conceptual hypotheses proposing dispositional antecedents and socio-cognitive mediators of abusive supervision and laissez-faire leadership. We argue that leader neuroticism, agreeableness, and conscientious have both direct and indirect relationships with abusive supervision and laissez-faire leadership. We identify leader self-efficacy, affective motivation to lead, and control appraisals as mediators linking leader personality and leader behavior. Data were collected from 400 supervisor-subordinate dyads from a wide range of business sectors in the Philippines. Results of structural equation modelling suggested that leader agreeableness has both direct and indirect relationships with the two types of destructive leadership. In contrast, leader conscientiousness and neuroticism displayed indirect relationships with abusive supervision through leader self-efficacy and perceptions of control. Our paper ends with a discussion of the strengths and limitations of our theoretical approaches and empirical findings.

**Broadening perspectives on student motivation, learning and wellbeing**

Chair(s): WATT, H. (Monash University)

Discussant(s): MARTIN, A. (University of Sydney)

The proposal offers broadened perspectives on student motivation, making links beyond achievement scores which are commonly studied in existing research, to encompass important broader learning and wellbeing outcomes. The key objectives of the symposium are to establish how different profiles of Australian student learning goals relate to their achievement, coping, and wellbeing (paper 1); the relevance of cultural dimensions in Indonesia of religiosity and ethnicity to university students’ motivations, attribution styles, self-efficacy and achievement (paper 2); intra- and extra-individual frame of reference effects in the micro-development of German students’ general and domain-specific self-concept in the transition to secondary school (paper 3); and the effects of career outcome self-efficacy on Canadian young adult men’s and women’s academic motivation and STEM (science, technology or mathematics) career aspirations (paper 4). A diversity of cultural contexts is included, with samples come from secondary students in Australia and Germany, and university students in Indonesia and Canada. Different social-cognitive motivation theories are represented: goal theory, attribution theory, self-concept, and self-efficacy theories. Sophisticated methodological approaches and analyses provide robust empirical evidence for the interpretations and conclusions made by the authors, including structural equation modeling, cluster analyses, latent growth curve modeling, and MANOVA. Following each individual presentation, our Discussant is a senior motivation researcher and Professor, well-known for his influential and pioneering work in the field. His breadth of background and depth of expertise across the motivation perspectives and methodologies included, brings an especially dimension to his critique, insights, and
Combination of learning goals’ effect on learning strategies and coping skills

TOH, Y. (Monash University)

This study examines the 2x2 Learning Goals, and Work Avoidance goal, in relation to learning strategies and coping behaviour. It looks at how each learning goal (and their combinations) affect students’ academic achievement and psychological wellbeing. Four path models and MANOVA results are presented to map out the relationships among variables. Results were derived from a survey with 341 Grade 7-12 students from 2 Melbourne high schools. These established scales were administered: 2x2 Goal Questionnaire, Learning Process Questionnaire, Brief-COPE, and DASS-21. Path model 1 supported a fit between learning goals, learning strategies, effort, and the academic achievement outcome variable. Deep learning and effort were found to partially mediate the relationship between learning goals and achievement. Path model 2 supported a fit between learning goals, coping behaviours, and the psychological wellbeing outcome variable. Certain coping behaviours partially mediated between learning goals and psychological wellbeing. In contrast, Path models 3 and 4 used cluster membership based on learning goal profiles, to predict outcomes. Results differed when learning goals were combined, as opposed to each single learning goal as a predictor. MANOVA compared between-cluster differences. Results suggest that when learning goals were predictor variables on their own, the Mastery Approach goal was most adaptive, compared to the other four goals, for both academic achievement and coping. This goal related significantly to deep learning and effort, which in turn, led to better academic achievement. However, a different picture emerged when learning goals were combined. The cluster group which had moderate scores for all the 2x2 goals and had the highest academic achievement compared to the other groups (High-Performance, High-Mastery, All-Goals-Low, All-Goals-High). It seems that being moderately multiply engaged by several goals is therefore more adaptive than any single learning goal in isolation. A somewhat similar pattern could be seen in terms of the learning goals’ relations to coping behaviour and psychological wellbeing. Once again, the group with moderate scores for all 2x2 goals indicated better psychological wellbeing. In conclusion, there appears to be a common thread that runs along learning academically, and coping with stress.

The effect of students’ attribution on motivation and academic performance: a study among native and Chinese Indonesian university students

SUTANTOPUTRI, N. (Monash University)

This study focused on attribution and motivation among Indonesian university students. Previous studies have found that one’s attribution can be influenced by cultural background, and that there are differences in motivation among ethnicities. This research explored the possible connections among attribution, motivation, and cultural factors (ethnicity, religiosity, gender) with Indonesian university students. In total 443 students participated (155 male, 287 female), from each a public and a private university, because racial issues permeate the educational setting: mostly native Indonesians study at public universities and mostly Chinese Indonesians at private universities. Three dimensions of students’ attribution were included: locus of control, stability, and controllability. Measured motivations included achievement goals (learning goals, performance-approach and avoidance goals), work-avoidance motivation, and learned helplessness. Implicit theories of intelligence and self-efficacy were also measured. The results show some interesting relationships between students’ attribution and motivation; some supported hypotheses and others gave another interpretation. Students with internal, stable,
Controllable attributions were found to adopt learning goals but not performance approach goals, and to have high self-efficacy. Students with external, unstable, uncontrollable (external) attributions were linked with performance-avoidance goals and learned helplessness. Internal, unstable, externally controlled attributions related to work-avoidance motivation. It was also found that high religiosity was linked with external, stable, controllable (personal) attributions. There were not any differences between male and female participants regarding their locus of control, stability, personal and external control attributions, or religiosity. This study adds more knowledge to the study of relationships between attribution, related motivation variables, and cultural setting, within the context of the Indonesian higher education sector.

**Keywords:** attribution, motivation, cultural factors, self-efficacy

**Implications of ability grouping for development in general and domain-specific self-concepts of ability after the transition to secondary education**

AUST, K. (University of Goettingen), WATERMANN, R. (University of Goettingen), GRUBE, D. (University of Goettingen)

In Germany, there is usually a tracked system of secondary school after Grade 4. Some high-track schools (“Gymnasium”) also offer special classes with a certain profile e.g. bilingual or mathematics. In these special classes, often achievement is even higher than in standard classes at the same school. It has been shown that attending classes or schools where class-average achievement is higher, leads to lower self-concepts after controlling for individual achievement (Big-Fish-Little-Pond-Effect; Marsh, 1987). This might be problematic for students, because academic self-concept relates to wellbeing, as well as academic achievement (Marsh et al., 2006). However, it has not yet been examined how the development of self-concept proceeds exactly in the first half-year after changing to a high-track school, and whether there are bigger changes in general or domain-specific self-concept. Our longitudinal study examined whether students assigned to different school and class types (comprehensive school, standard Gymnasium classes, Gymnasium classes with a mathematics, science or bilingual profile) show differential developmental trajectories in general self-concept of ability and domain-specific self-concepts in mathematics and German, after the transition to secondary education. All participants were Grade 5 students who had received a Gymnasium recommendation: 139 were attending a Gymnasium with three standard classes and two classes with special profiles, and 99 were attending a comprehensive (non-tracked) school. General self-concept of ability was measured at five time-points, and domain-specific self-concepts at three time-points, in participants’ first semester of secondary education following the school transition. Latent growth modelling analyses revealed that students in high-ability classes with special profiles showed a decrease in general self-concept of ability, but not in mathematics or German self-concept. Against the background of these results, the influence of basking-in-reflected-glory-effects is proposed to offset predicted BFLPE effects.

**Keywords:** secondary education transition, general self-concept, domain-specific self-concept

**Academic motivation in post-secondary students: effects of career outcome expectations and field of study**

DOMENE, J. (University of New Brunswick), WOITOWICZ, L. (Trinity Western University)

Social cognitive theory proposes that human agency and performance is affected by several mental processes, including self-efficacy and expectations for a successful outcome. Despite these conceptual links, the fact that academic motivation is future-oriented, and the literature establishing the role of self-efficacy in motivation, less attention has been paid to the role of outcome expectations than efficacy in determining students’ academic motivation. This study was an examination of the effects of general career outcome expectations (COE) on post-secondary students’ intrinsic and extrinsic academic motivation. We were particularly interested in determining whether these effects differed according to gender, and
whether or not the student aspired to a science, technology or math (STM) career path. A quasi-experimental design was utilized, with data collected from an online survey. Established measures of academic motivation and COE were used and STM aspirations coded from self-reports of students’ anticipated future occupation. Separate ANOVAs were conducted with intrinsic and extrinsic as the dependent variable, and career expectation group (high, mid, low), gender (male, female), and STM aspiration (yes, no) as independent variables. For intrinsic motivation, significant differences were found for COE and STM. Interaction effects were not significant. Posthoc tests revealed that students with high COE, and students with STM aspirations, were more motivated than their peers. For extrinsic motivation, significant effects emerged for COE, STM, and the gender*STM interaction. Specifically, people with high COE have higher extrinsic motivation levels, and, although women in the STM and non-STM groups are similar, males with non-STM aspirations have lower extrinsic motivation than their STM counterparts. Hypotheses were partially supported by the results, and generally confirmed the tenets of social cognitive theory regarding the influence of outcome expectations on academic motivation. The unexpected absence of interactions between STM and COE may be due to the use of a general, rather than discipline-specific, measure of expectations. Forming the IVs from pre-existing characteristics rather than random assignment also limits claims of causality. Nevertheless, these results suggest that improving students’ expectations of a successful career outcome may benefit their motivation for academics. Specific strategies for doing so will be discussed.

**Building trust across cultures: Challenges and opportunities for organizational research and practice**

Chair(s): KOEHLER, T. (The University of Melbourne)

Discussant(s): HARTOG, D. D. (Amsterdam Business School)

Previous research has identified various challenges for trust building across cultures including, but not limited to, lack of shared understanding (Cramton, 2001), increased affective and cognitive conflict (Hinds & Bailey, 2003), and different use and interpretation of English (Berry, Carbaugh, Innreiter-Moser, Nurmi-kari-Berry, & Oetsch, 2009). However, we know far less about how trust can be built effectively across cultures and how the actual trust-building process takes shape. Accordingly, the aim of the current symposium is an in depth exploration of trust building and maintenance across cultures. Key learning objectives from the presentations include: 1) understanding the dynamic process of trust building across cultures; 2) exploring the influence of cultural differences on trust building by looking at culture at an in-depth level, i.e., contrasting different ‘species’ of collectivism across cultures, capturing different cultural identities and the role they play in the trust building process, describing cultural differences regarding the underlying meaning of trust-related concepts and their effect on trust formation across cultures; and 3) capturing the effect of context specific variables such as the asymmetric nature of hierarchical relationships in manager/subordination relationships for trust building. Special attention should also be given to the diversity in methodological approaches, samples, and cultural background of the researchers in this symposium. The papers in the current symposium use survey research, participant observation, semi-structured interviews, and business simulation to gain insight into trust building across cultures.
Samples come from the USA, Germany, Finland, Turkey, China, and 18 other countries. The researchers themselves are very diverse, coming from countries such as Australia, Spain, Austria, Singapore, Turkey, the Netherlands, the UK, and the USA. Given this diversity, the current symposium provides a great representation of trust building processes around the world. Implications from the research will be discussed by an eminent scholar in the field of cross-cultural management who has published extensively on challenges to trust across cultures. The discussant will critique the papers and provide an outlook on opportunities for future research.

Towards a theory of trust and culture: Dynamic processes of trust building through cultural identities

GILLESPIE, N. (The University of Queensland), CHAO, G. T. (Michigan State University), DIETZ, G. (Durham Business School)

Trust-building and relationship maintenance are critical processes for sustainable organizational success, particularly in complex environments characterized by high ambiguity, uncertainty, and a wide diversity of potential trust partners (Johnson & Cullen, 2002). Yet developing and maintaining trust between different ‘cultures’ is a formidable challenge.

In this conceptual paper, we present a theory toward understanding how a person’s cultural identities affect trust building. Recent treatments of culture extend this construct beyond definitions of national culture. Chao and Moon (2005) present a meta-theory that redefines the usual nation-level interpretation of culture to include associative, demographic, and geographic factors. When culture is defined by shared values and behaviors among a specific group of people, multiple cultural identities emerge. Associative cultural identities draw on different groups or social identities such as professions, religions, or organizations. Demographic cultural identities are based on physical characteristics of group members such as gender, race, or age. Finally, geographic cultural identities are shaped by natural or man-made environments such as rural/urban, coastal/in-land, or temperate/tropical distinctions. Multiple cultural identities form a cultural mosaic within individuals, offering a variety of values and behaviors that can facilitate or impede trust-building and relationship maintenance. We draw on literature from diverse work groups (cf. Harrison, Price, Gavin and Florey; 2002), to describe a process whereby trust relationships are initially influenced by surface-level cultural identities and later progress to deep-level forms of culture. It was found that surface-level diversity differences are obvious features that separate groups (e.g., race, gender, and age) and constitute demographic cultural identities. They influence culturally-based behaviors or “strategies of action” that set initial conditions for trust building (Swidler, 1986). Subsequent interactions can rise above superficial differences, moving trust partners away from surface-level differences to focus on deep-level forms of diversity. These forms may be psychological and include individual differences such as personality traits; they may also be value-based and influenced by associative cultural identities. Thus, time is viewed as a medium where different cultural identities are salient at different developmental stages of trust building and maintenance. Furthermore, situations that call for trust repair (Gillespie & Dietz, 2009) are theorized to benefit from shared cultural identities between trust partners.

The effect of OCB on managerial trustworthy behavior: The roles of manager trust in subordinates and collectivism

We take a social exchange theory perspective to conceptualize subordinates’ organizational citizenship behavior (OCB) as an antecedent of managerial trustworthy behavior and examine how managerial trust in subordinates mediates this relationship. We also investigate to which extent this mediation is moderated by the level of collectivism prevalent in a society. Data were collected from 741 managers and 2111 subordinates in 18 countries representing all major cultural regions of the world. Using robust data analytical techniques, we show that managerial trust in subordinates partially mediates the relationship between subordinates’ OCB and managerial trustworthy behavior across the different countries studied. We also find that manager trust in subordinates will only mediate the relationship between subordinates’ OCB and managerial trustworthy behavior when collectivism is low but not when it is high. Our contributions to existing research are threefold: First, we extend the literature on manager-subordinate trust by explicitly focusing on managerial trust perceptions and conceptualizing the transition between behaviors and affective states in manager-subordinate exchange relationships. Specifically, we investigate how subordinates’ OCB relate to managerial trustworthy behavior and how managerial trust in subordinates as an affective state (McAllister, 1995) mediates this relationship. In doing so, we develop and validate a comprehensive scale of managerial trustworthy behavior based on the work of Whitener et al. (1998). Second, we contribute to the literature on OCB by explicitly conceptualizing OCB as an antecedent of attitudinal as opposed to more behavioral performance outcomes. Third, we test our conceptual model across a wide range of cultures that represent the different regions of the world and examine the role of collectivism as a moderating factor, testing the boundary conditions of manager-subordinate relationships across cultures.

Why do I trust my coworkers? Comparison of factors of trustworthiness among peers across Turkey and China

TAN, H. H. (Singapore Management University)

Dyadic trust research including the seminal Mayer, Davis and Schoorman (1995) model has been applied to contexts outside North America without careful understanding of the distribution of social practices and everyday situations in such contexts (Wasti, Tan, Brower, & Onder, 2007). This study examines culture-specific workways for understanding the development of peer trust in organizations in collectivistic cultures. Workways refer to the pattern of workplace beliefs, mental models and practices about what is true, good and efficient within the domain of work (Sanchez-Burks & Lee, 2007). Semi-structured interviews were conducted with 22 Turkish and 29 Chinese employees working for a variety of organizations located in Istanbul, Turkey and ShenZhen, China. The interviews suggested that in collectivistic cultures, where the professional/personal dichotomy is less clear (Gelfand, Leslie, & Fehr, 2008) the multiplexity of work relations is essential for understanding the foundations of interpersonal trust. Multiplexity refers to the extent to which affective and instrumental concerns are shared within the same relationship (e.g., coworker and friend; Morris, Podolny, & Ariel, 2000). In the Turkish sample, trust building appeared to be holistic in terms of seeking to share personal information, time and space, thereby expanding the bandwidth of trust. In this context, much reference was given to the benevolence as well as the integrity of the trustee as exhibited within and outside of the work context. This is in contrast to the Chinese sample where common background (in terms of guanxi and experience) and values emerged as an important antecedent. The guanxi element plays a big role in trust building for peers. Also, out of the three big categories of trust antecedents (ability, benevolence, and
KOEHLER, T. (The University of Melbourne)

One of the most important influence factors for trust development is experience. Trust develops as a result of the trustor experiencing competent, reliable, and well-intentioned behavior on the part of the trustee (Mayer, Davis, & Schoorman, 1995). However, what happens when interpretation of the same behavior differs between the trustor and the trustee due to cultural differences? Differences in cultural background affect how we interpret meaning of a given message (e.g., Carbaugh, 1999; Philipson et al., 2005) and how we interpret behaviors and attribute cause (Kim, 2005). This can negatively impact team member trust (Bradach & Eccles, 1989). The current study observed internationally distributed student teams from three countries (USA, Finland, and Germany) during two international collaborations. Findings from this qualitative study showed that the same behavior can lead to very different attributions about the actor’s intentions depending on underlying cultural norms. For example, differences exist in what honesty means and how it is expressed in the three different cultures. The data suggests that honesty for Finns means that one means and does exactly what one said. What one said one would do becomes a promise that other Finns rely on. To Germans, honesty is about candi-dness and sincerity. Saying exactly what one means and meaning what one says are important to show respect for others by not deceiving them. American students highlighted the importance of open communication for honesty. However, to be polite Americans will often describe things as nicer than they really are, especially when they have to convey a negative message. Furthermore, things one said one would do are not always followed by action. Integrity is one of the major factors for building trust (Mayer, Davis, & Schoorman, 1995). The fact that the same behavior can lead to attributions of integrity for one cultural group but not for another based on different cultural expectations makes trust building in multi-cultural teams difficult. The current study highlights the importance of nuances of cultural differences that offer deeper and more meaningful distinctions than commonly used dimensional systems of culture such as Hofstede’s (1980) or Trompenaar’s (1994).

Keywords: trust, experience, cultural differences, attributions, integrity
Career adaptability: Cross-cultural examination of a model and measure

Chair(s): SAVICKAS, M. (NE Ohio Universities College of Medicine)

Discussant(s): HOU, Z. (Beijing Normal University)

To assist individuals manage their working lives and encourage organizations to provide career coaching, vocational psychologists have recently formulated a new model of career adaptability as well as constructed measures and materials to increase adaptive readiness and resources. This work on career adaptability has been conducted by research teams in twelve countries. In this symposium, representatives of the international project will present for the first time the results of their work. The symposium will begin with a brief overview of the theory and taxonomy of career adaptability that they jointly formulated. Then, the symposiasts from five countries will each explain how they have contextualized the model of career adaptability to address cross-cultural issues and present the results of studies that empirically evaluate the model. A discussant will close the session by critically commenting on the papers. Participants should leave having accomplished five learning objectives: (1) understand the theory of career adaptability; (2) distinguish the dimensions of willingness, ability, and performance; (3) obtain and evaluate inventories that measure career adaptability; (4) examine empirical research on career adaptation; and, (5) appreciate cross-cultural differences in career adaptability. Career adaptability is a multidimensional construct that concerns individual differences in the willingness, competence, and performance of behaviors required to negotiate work transitions. The performance dimension concentrates on five principal types of coping behaviors that constitute adaptation: orientation, exploration, establishment, management, and disengagement. The willingness to engage in these coping behaviors constitutes the personality dimension in the model. Willingness to adapt is viewed as a compound psychological trait composed by facets of flexibility, proactivity, conscientiousness, and openness. The third dimension of the model is adapt-abilities. In comparison to the psychological trait of willingness to adapt, adapt-ability is a psychosocial competence, which is distinct from the behaviors that produce adaptation and its outcomes. Career adapt-abilities include concern, control, curiosity, confidence, collaboration, and cooperation. Together the willingness and adapt-abilities shape an individual’s readiness and resources for performing the behaviors need to cope with current and anticipated vocational development tasks, job transitions, and work traumas in their occupational roles that, to some degree large or small, alter their social integration.

Career adaptability in Iceland: Test of a model and measure

VILHJÁLMSDÓTTIR, G. G. (University of Iceland), JÓNSSON, F. H. (University of Iceland), EINARSDÓTTIR, S. (University of Iceland), KJARTANSDÓTTIR, G. B. (University of Iceland)

The Icelandic economic system is undergoing a severe crisis that started in the fall of 2008. Unemployment has risen dramatically and this society of 320,000 inhabitants will have to adapt quickly to new working conditions. In this atmosphere the concept of career adaptability becomes essential. It has been defined as the individual’s readiness and resources for coping with current and imminent changes in a career, such as in vocational development tasks, occupational transitions, and personal traumas. This presentation will explain how a new model of career adaptability has been refined to fit the Icelandic context. The presentation will include results from an empirical study that evaluates the model and its usefulness. The study was conducted in two steps. First the model of career adaptability was examined relative to its use in Iceland. This resulted in minor modifications of the model. Then, the Career Adapt-Abilities Inventory (CAAI) was translated into Icelandic and expanded to include additional items that are culturally-specific to Iceland. The CAAI measures the strength of the individual in adaptive tasks that
Abstracts of the 27th International Congress of Applied Psychology

touch upon the five dimensions of career adaptability: concern, control, curiosity, cooperation and confidence. The new items did not create a further dimension of adaptability. Instead it added items to make each dimension particularly relevant to individuals in Iceland. The first study to be reported dealt with the psychometric qualities and applicability of the CAAI in Iceland. The Icelandic version of the inventory was administered to a sample of 491 Icelandic youth (285 female and 206 male). The results indicated that the inventory had sound reliability and results of a factor analysis were satisfactory. The reliability estimates of the five scales ranged from $\alpha = .83$ to $.95$. Given this initial evidence of reliability and factor analysis, a second study is now being conducted to examine the inventories concurrent validity and its validity for use in career assessment with individuals. In this study the inventory will be administered to a sample of 3000 individuals ranging in age from 15 to 65 years (5 age groups). The results of the two studies will be discussed relative to cross-cultural soundness of the new model of career adaptability, its translation into a measure, and its usefulness in the career assessment of individuals and groups.

Keywords: career adaptability, Iceland, Career Adapt-Abilities Inventory, economic system, career assessment

Career adaptability in Portugal and Brazil: Test of a model and measure

DUARTE, M. E. (University of Lisbon), LASSANCE, M. C (University of Lisbon)

The theory of career construction and life-design counseling concentrates on three domains: personality, adaptability, and identity. Adaptability, in particular, must be considered from a cross-cultural perspective that is sensitive to context and the personal experience of individuals in diverse situations. Members of an international research team have jointly constructed a general model of career adaptability. Each member heads a national research team that is examining the validity and usefulness of the model in a particular country. This presentation aims to report the results of studies of career adaptability in Portugal and in Brazil. The examination of career adaptability in Portugal and Brazil began with a conceptual evaluation of the construct in these two countries. The operational definitions of the construct were expanded to include behaviors specific to these countries. Then, the Career Adapt-Abilities Inventory (CAAI) was translated into Portuguese and expanded to include additional items that are culturally-specific to Portugal and Brazil, respectively. The CAAI measures the strength of the individual in adaptive tasks that touch upon the five dimensions of career adaptability: concern, control, curiosity, cooperation and confidence. The Portuguese and Brazilian adaptations were administered to different samples, including university students, unemployed adults, and high school pupils. The presentation and discussion of the results and its importance for career counseling illustrates this new way to “measure” adaptability. Some psychometric analyses suggest modification of the theoretical model of career adaptability and its application in different cultures and contexts. Implications for practice and intervention on the field of career construction are discussed.

Keywords: career construction, career adaptability, Portugal, Brazil, Career Adapt-Abilities Inventory

Career adaptability in Holland: Test of a model among the unemployed

VAN VIANEN, A. E. M. (University of Amsterdam), KOEN, J. (University of Amsterdam), KLEHE, U. C. (University of Amsterdam)

Unemployment can be a depressing and literally sickening experience (e.g., McKee Ryan, Song, Wanberg, & Kinicki, 2005). Most unemployed people will try to end this unfortunate state as soon as possible by searching for a new job. Reality shows, however, that the path towards reemployment is often long and does not necessarily bring a person closer to the final goal of finding a fitting job. The duration of unemployment depends on economic factors, but individual factors have been found to contribute as well (e.g., Kanfer, Wanberg, & Kantrowitz, 2001). In essence, people differ in their adaptive resources for managing transitions. That is,
they may have or lack the necessary concern, control, curiosity, and confidence for searching for and finding a new job (Savickas, 2005). Little is yet known about the precise role of people’s career adaptability in the process of finding reemployment. In this study, we examined how four dimensions of career adaptability (concern, control, curiosity, and confidence) translate into people’s job search strategies and the following (quality of) reemployment. In addition, given the importance of career adaptability for successful career transitions, research is warranted that investigates the determinants of career adaptability. In the context of (long-term) unemployment, it is particularly important to assess how people’s career concern, including the setting and pursuing of career (i.e., reemployment) goals, can be influenced. A pervasive phenomenon that unemployed people face is the many rejections in response to their applications. Moreover, they are often obliged to participate in reemployment-related interventions that do not always suit their preferences and abilities. Hence, unemployed people often experience loss of control and autonomy, which may impair goal setting or undermine the quality of their goals (for example, a focus on extrinsic rather than intrinsic goals). Thus, we examined how people’s perceptions of autonomy or control during a reemployment intervention impacted upon the setting and quality of their career goals.

Career adaptability in South Africa: Test of a model and measure

MAREE, K. (University of Pretoria)

A new social arrangement of work poses a series of questions and challenges that individuals who work in global economies must address. Life-design counselling is a concept that integrates the process of career construction and self-constructing with the unique factors that play a role in an individual’s life at a specific time and in a specific context and describe vocational behaviour and its development. Career and self-construction are characterised by the intentional integration of and the simultaneous focus on personality characteristics, developmental processes and individual stories and are therefore still related to the overall fitting of individual characteristics with possible careers. The framework for life designing is therefore structured to facilitate strategies that are lifelong, holistic, contextual, and preventive. Against the framework explicated above, this presentation will report the results from three research projects dealing with model of career adaptability and the methods of life-design counselling in South Africa. Each study will use mixed methods of quantitative and qualitative research to describe and explore the meaning and measurement of career adaptability. The study will be a case report describing the impact of life-design counselling on an adolescent from a minority group who had passed Grade 12 and experienced a need for career counselling. The second study will examine the adaptability of Grade 11 students identified as potential leaders relative to gender and socio-economic level. The third study will examine the career adaptability needs of adolescents in a psychiatric institution. Each of the three studies is using a brief biographical questionnaire and the South African Career Adapt-Abilities Inventory (an Afrikaans version). Taken together, the results of the three studies will show the reliability and initial validity of the South African version of the Career Adapt-Abilities Inventory as well as its validity for use in diverse cultural contexts. The results will also be used to suggest modifications to the theoretical model of career adaptability and its cross-cultural utility.

Keywords: life-design counselling, career adaptability, South Africa, adolescents, career counselling

Career adaptability in France: Test of a model and measure

The research to be reported aimed to consider the validity and reliability of the five dimensions of the French version of the Career Adapt-abilities Inventory (named Cady in
French) with populations of senior high-school and college students. The study explored the construct validity of the Cady using factor analysis as well as its concurrent validity by examining links between the five adapting competencies described in the Career Adapt-Abilities Inventory and more classical dimensions related to students’ adaptation to their current academic conditions. The four dimensions used to examine concurrent validity were satisfaction and adjustment to college, self efficacy beliefs, motivation, and anxiety in school context. Four scales are used simultaneously with the Career Adapt-Abilities Inventory: a French version of the Baker & Siryk’s Student Adaptation to College Questionnaire (SACQ; 1984) in order to explore various facets (academic, social, personal adjustments and academic commitment) of students’ adjustment to college. Motivation is approached with a French questionnaire (QMF-Forner, 2006) that explores three main dimensions: time perspective, fear of failure and locus of control. Perceived anxiety in school context is measured by the Future School and Career Anxiety Inventory (ANSSP-Mallet & Vignoli, 2005). High-school students’ self-regulation is dealt with a self efficacy beliefs questionnaire about their capacities to control events that affect their lives. We present the principal components analysis of the items to determine how well the factor structure fits the theoretical model of five capacities. We will also present the principal links with other dimensions and specify the differences between career adaptation and school adaptation. In conclusion, we read these results in connection with life designing perspective, and try to explore how measures of adaptation could be used in a constructivist approach.

Keywords: career adaptability, career adapt-abilities inventory, motivation, anxiety, life-designing

Career anchors: Empirical evaluations of the concept and its applications

Chair(s): ARNOLD, J. (Loughborough University), GUEST, D. (Kings College London)

Discussant(s): GUNZ, H. (University of Toronto)

Ed Schein’s long-established concept of career anchors and his method for assessing an individual’s anchor(s) have for some years been commonly used tools in practical career development workshops and career planning exercises. Although the academic literature has not entirely ignored career anchors (see for example Feldman & Bolino, 2000; Schein, 1996), they have figured less in research than in practice. This leads to two learning objectives for this Symposium. First, participants will discover more about the validity or otherwise of the career anchor concept and measures. For example, do they adequately represent the key guiding values for all or nearly all people? Second, what work/career behaviours and attitudes, if any, are anchors related to? These questions matter, because the answers will clarify the usefulness (or not) of anchors as a practical tool, as well as specifying what refinements are needed. All four papers within the symposium include large-scale data. Collectively they address the construct validity, behavioural correlates, and demographic differences concerning career anchors, as well as the utility of seeking congruence between a person’s anchor and their job. The data are collected from people in the United Kingdom, South Africa, Switzerland, and Germany. The four papers indicate that there is both good news and bad news concerning career anchors. Schein’s typology seems to work reasonably well, but it does need adjustment at least for some groups. It is linked with other related career attitudes, and also importantly with behaviours. Anchor scores differ systematically between some demographic groups, but no group can be stereotyped in a way that justifies undifferentiated HR career policies in organizations. There does seem to be some
value in using anchors as a conceptual basis for matching people to jobs. These and other themes will be brought together by our Discussant, Professor Hugh Gunz from the University of Toronto. With his distinguished contributions to the careers literature, and insightful perspectives on it, he is unusually well-placed to draw out the practical and theoretical implications of the work presented in the Symposium. He will also offer constructive critique of the papers.

**Career anchors of professional workers: extending Schein’s framework**

RODRIGUES, R. (Kings College London)

Schein’s (1996) concept of career anchors has had a major influence on career theory and career management. This line of inquiry is particularly important in times of turbulence for workers, whose careers some consider to have become flexible (Cappelli, 1997) and boundaryless (Arthur, 1994). However, Schein’s research is based on a limited sample of MBA students and it is not clear that his typology adequately captures the career experiences of other types of worker. In addition, his research has been more concerned with developing a typology of anchors than exploring their influence on people’s career choices and attitudes. There is therefore a need to broaden the empirical analysis of career anchors and to study their correlates. This paper reports the findings of two studies conducted among professional workers in the UK. Study One replicates qualitative elements of Schein’s methodology, capturing the career histories, goals and ambitions of 37 professionals. Study Two was a quantitative test of an amended measure of career anchors and an exploration of some of its key correlates drawing on a sample of 1,400 professionals. Our Study One findings suggest that Schein’s typology needs to be adapted to reflect the career anchors of non-managerial workers. In particular, we found that the ‘managerial competence’ and ‘pure challenge’ anchors reflected Schein’s focus on a managerial population. Study Two results show that our measure has good psychometric properties and that career anchors are differentially associated with attitudes (organizational and occupational commitment) and career mobility intentions. For instance, entrepreneurial and challenge oriented individuals seek career opportunities across organizational boundaries, whereas people with a managerial anchor feel more committed to their organizations and seek internal promotion. In contrast, lifestyle oriented professionals prioritize their personal and family lives over their work. Our findings highlight some of the limitations of Schein’s framework and extend the career anchor model by showing that stable career preferences are associated with specific career patterns and attitudes. They encourage further research on the correlates of career anchors and contribute to reviewing their role in the context of the changing nature of work and careers.

**Keywords:** career, schein, managerial competence, career development, career mobility intentions

**Exploring the internal career orientations and subjective work experiences of working adults in the South African organizational context**

COETZEE, M. (University of South Africa)

This research investigated the use of the research version of the Career Orientations Inventory (COI) (developed by Schein, in collaboration with DeLong, 1982a; 1982b), as a measure to determine individuals’ career orientations and a Subjective Work Experiences Scale (SWES) (Bergh, 2009) to measure subjective work experiences. A secondary objective was to investigate whether the factor structure underlying the theoretical eight-factor career anchor model developed by Schein (1978) applies equally across various ethnic groups in the multicultural South African organisational context. The tertiary objective was to investigate whether individuals’ career orientations significantly relate to their life satisfaction, job/career satisfaction, happiness and perceptions of work as a valuable activity. A quantitative survey design was used to achieve the research objectives. Responses were obtained from 2,978 participants (67% blacks including 1,592 Africans; 224 Indians; 186
coloureds, and 976 whites (33%) at predominantly managerial and supervisory level in the South African service industry. The mean age of the participants was 32, which implies well-established internal career orientations, motives and values. Exploratory Factor Analysis (EFA), Confirmatory Factor Analyses (CFA) and Structural Equation Modeling (SEM) were performed to achieve the objectives of the study. The exploratory factor analysis yielded a nine-factor structure and the confirmatory factor analysis confirmed five constructs as measures of the career orientations domain. A similar factorial pattern was observed across the African and white groups and a weaker factorial pattern across the Indian and coloured groups. Significant relationships were observed between the five-factor COI model and SWES variables. It appears from the statistical analyses that the career orientations of the participants relate to different aspects of the master career motives that underlie the general management, pure challenge and entrepreneurial/creativity career anchor constructs and that these master motives are significantly related to their life satisfaction, job/career satisfaction, sense of happiness and perceptions of work as a valuable activity. The findings of this study contribute valuable new knowledge both to practice and the field of Career Psychology.

Investigating the role of career anchor congruence

STEELE, C. (University of Worcester)

The career anchor model has been widely researched and is used in practice to support individuals in their career development. Schein (1978) believed that congruence between career anchors and the work environment would lead to positive outcomes. However, Schein also believed that you could not tell an individual’s career anchor from their job title. To date positive relationships have been found between career anchor congruence and job satisfaction (Danzi
er & Valency, 2006), career satisfaction (Igbaria & Baroudi, 1993), organisational commitment and negative with intention to leave (Igbaria, Greenhaus & Parasuraman, 1991). However, contrary to Schein’s recommendation, these studies have made assumptions about which career anchor(s) are best suited to particular jobs. For example, Bester, Phil and Mouten (2006) assumed the sense of service anchor was the dominant anchor for psychologists. The research presented here was conducted within a UK police organization. First, a commensurate measure of job anchors was developed using ratings by subject-matter experts of the anchors best suited to specific jobs in the organization. The resulting anchor profiles were compared with the career anchor scores of individual job incumbents (n = 101). Second, participants were asked to rate their perceived level of congruence between their career anchors and both their job and their organization (n = 122). Hierarchical regression analysis showed that using the job anchor measure congruence predicts 4.1% of the variance in job satisfaction but was not significantly related to organizational commitment. Individuals’ perceptions of congruence predicted 3.2% of the variance in job satisfaction and 3.7% of the variance in organizational commitment. The study demonstrates that career anchors can be successfully matched to job roles within an organization and that there are significant relationships between career anchor congruence and job satisfaction and (to a lesser extent) organizational commitment. Future research should seek further validation of the job anchor measure and explore the role of career anchor congruence in relation to work related outcomes in a variety of contexts.

Career anchors as a tool for organizational career management in the IT sector

ARNOLD, J. (University of Applied Sciences in Business Administration, Zurich)

Several studies have highlighted the potential benefits of using career anchors as a tool for organizational career management (e.g. Yarnall, 1998) and cautioned that ignoring the
variety of anchors in an organization may have negative effects, for example on motivation (e.g. Crepeau et al, 1992). However, little attention has yet been focused on the question how exactly career anchors may inform organizational career management. One important step in this direction would be a better understanding of how career anchors may be related to certain demographic characteristics or specific behaviour of individuals. Only a few studies have focused on such aspects (e.g. Mignonac & Herrbach, 2003). In a wider ongoing study of career orientations of IT professionals in Switzerland, Germany and the United Kingdom, this gap in research was addressed, based on the 25-item measure of career anchors reported by Igbaria and Baroudi (1993). Career anchors of more than 1,600 Information Technology (IT) professionals in 10 different organizations of varying size from a wide range of industries in both the private and public sector were examined. Findings support earlier studies regarding the variety of career anchors among IT professionals, refuting the cliché that IT professionals predominantly have “Technical & Functional Competence” anchors. Second, results suggest that certain career anchors may be associated with specific demographic characteristics. For example, young employees had significantly higher “Lifestyle” anchors than older ones. Third, some career anchors seem to be linked to actual behaviour. Individuals with high security anchors, for example, showed significantly lower job mobility than those with low security anchors. Fourth, certain career anchors may be related to how individuals evaluate their career success. For example, scores on the “Managerial Competence” anchor were positively associated with self-rated career success. Using career anchors to inform Human Resources Management policies and practices may be especially helpful in the IT industry where attracting and retaining adequately trained staff remains a challenge for many organizations. Our findings reinforce the need to think beyond “dual career” technical vs managerial tracks for IT professionals, and to offer Human Resources packages that meet the specific preferences of different demographic subgroups.

Challenges in psychological assessment: From temperament to metacognition and self-regulation

Chair(s): AIDMAN, E. (DSTO & Kingston University London)
Discussant(s): STANKOV, L. (National Institute of Education)

This symposium will examine the challenges faced by the modern practice of dispositional assessment. Some of them are relatively new (e.g., those flowing from the accumulating research evidence about the mechanisms and correlates of metacognition and self-regulation), while others have persisted for decades - such as temperament and biological underpinnings of individual differences, or situation-disposition dichotomy (Mischel, 1968, 2004), and the challenge of expanding the unimpressive upper bounds of predictive and explanatory power of dispositional constructs. Methodology, conceptual underpinnings and applications of multilevel dispositional assessment will be discussed. The construct of temperament will be examined in its utility to generate explanations of the observed relationships between psychophysiology, types of nervous system, personality, cognitive styles and psychopathology. Five contributions will present a range of approaches and tools to measure temperament, dispositional thinking styles and self-regulation traits. The connections between temperament, personality and mood disorders will be discussed – as well as between self-regulation and cognitive ability. General discussion will focus on the future of dispositional assessment and on the next-generation methods to improve its predictive and explanatory power.

Psychology of temperament: State of the art and links to personality

TROFIMOVA, I. (McMaster University)

Personality assessment methods typically analyse the “final product” of interactions between the social and biological factors underlying individual differences. The intermediate construct, temperament, is less well understood. The paper will examine the nature of temperament and its mediating role in the relationship between personality constructs and psychophysiology. This presentation reviews leading theories and models of temperament based on the Western European, Pavlovian and North-American traditions. Temperament is viewed here as referring to biologically based individual differences with main links to endocrinal-limbic regulation and to the morphology of the nervous system. Findings in psychophysiology, neuropsychology, personality theory and personality disorders are compared to the traits described as temperament according to various approaches. The final list of temperament traits is reviewed from the point of view of the activity-specific model, which describes the structure of temperament as involving three aspects of activity - arousal, lability and sensitivity to certain aspects of the environment – taken in intellectual, communicative and physical areas of activity. Emotionality is presented in this model as a limbic-driven endocrinal amplifier of the same three dynamical aspects. The contribution of biologically based temperament traits to the development of personality and personality disorders is discussed with reference to the adaptivity of social behaviour. Conversely, the component nature of personality traits is analysed relative to the structure of temperament.

Keywords: personality assessment, individual differences, temperament, psychophysiology, emotionality

Self-regulation traits: Factorial structure and relationship to cognitive ability

EROFEEV, A. (Moscow State University), AIDMAN, E. (DSTO & Kingston University London)

Self-control is a tiresome task: whether resisting temptation, managing impressions or suppressing emotions, it typically reduces subsequent self-regulation capacity, ranging from declined vigilance to impulsive actions we
later regret. Both cognitive load and ego-depletion literatures converge on recognising self-regulation capacity as a key influence on important life outcomes, e.g. overeating or stereotyping. Negative effects may flow from transient or chronic reduction in self-control. While transient effects can be effectively studied by experimental manipulation (Hoffman, 2008), examination of chronic effects requires valid and reliable estimates of individual differences in self-regulation. Current paper reports a series of studies examining the nature of dispositional self-regulation constructs, and their relationship with personality and intelligence. The Self-Regulation Trait Inventory (SRTI; Zverkov & Aidman, 1990) is a self-report instrument assessing individual differences in self-mastery in a range of occupational contexts. Earlier studies examined SRTI’s factorial structure and psychometric properties of its subscales. Current study investigated associations between SRTI, Wonderlic’s WPT and 16PF’s primaries on a group of 177 Russian speakers (university lecturers and postgraduates). SRTI produces estimates of emotional resilience, goal quality, action bias, impulsivity-rationality, artlessness-shrewdness, motivational locus (externally-internally driven self-regulation), her-and-now (versus strategic) bias, and communicative plasticity. Two second-order factors have been replicated in SRTI’s factorial structure: (1) persistence (strength of intention, action bias, discipline) and (2) emotional control (self-mastery), as well as a global Self-regulation factor with internal consistency (α) ranging from .74 to .80. Correlation between the two ability estimates (WPT’s general aptitude score and 16PF’s factor B) was small but significant ($r = .18, p < .05$), and both significantly correlated with SRTI. Moreover, correlations between SRTI subscales and ability estimates were stronger than those between ability estimates and 16PF primaries. Results to date confirm the validity and reliability of SRTI constructs. Their incremental validity is discussed, in view of the reported associations between cognitive ability and 16PF primaries. SRTI appears a promising addition to assessment protocols used for occupational assessment. Potential applications and future development of the tool are discussed.

**Keywords:** cognitive ability, self-regulation, impulsivity, individual differences, personality

### Temperament and mood disorders

**SULIS, W. (McMaster University)**

This study examines the interplay of depression and anxiety in comorbid subjects using nine dynamical and three emotional aspects of behavior. The focus is on the contribution of biological and temperament factors to mood disorders, based on administration of the Compact STQ-77 to healthy Canadian subjects and to clinical sample of patients diagnosed with anxiety and depressive disorders. The Compact version of the Structure of Temperament Questionnaire (STQ-77) has 12 temperament scales, including three emotionality scales (Neuroticism, Impulsivity, Self-Confidence) and 9 scales measuring dynamic aspects of activity (ergonicity, lability, sensitivity to feedback) analysed separately for physical, social and intellectual activities. Emotionality is presented in this model as an amplifier of the arousal, lability and orientation aspects of activity. Beck Anxiety Inventory, Hamilton Depression Scale and Symptom Check-List, the Clinical Diagnostic Interview and the File review were also utilised. It was found that depression was associated with self-reports of increased impulsivity and rigidity of behavior, and comorbidity of depression and anxiety worsened these reactivity aspects. The ability to sustain attention on a mental task and to learn new information was lower in depressed patients than in other groups. Depressed patients reported significantly lower physical energy, tempo of physical activity and plasticity of behavior. The presence of comorbid anxiety further worsened this effect. Comorbid depression and anxiety might be associates, decreasing adaptivity and the self-regulatory balance of behavior, leading to the development of extremes in behavioral reactivity (impulsivity and rigidity). Our results support the notion that depression, anxiety and normality lie along a continuum of self-regulatory abilities.

**Keywords:** depression, anxiety, temperament, mood disorders, impulsivity
Structure and measurement of temperament: Activity-specific approach

ROUSALOV, V. (Institute of Psychology, Russian Academy of Sciences)

To discuss the findings of the experiments related to the properties of nervous system, conducted in 1970-80 in Russia, from the perspective of the structure of temperament. EEG recording, measurement of speed of writing, speed of reading, generation of words, maximal and optimal tempo of performance in sensory-motor tasks and intellectual tasks, performance on non-verbal tasks with which subjects were unfamiliar, rigidity of perception in tactile and visual modalities, duration of the switch between one way of solving the task to another, mobility in attention, variability in line drawing, Torrance’s Nonverbal Tests of Creative Thinking, meaning attribution to neutral objects, choice of profession, adaptivity strategies in the Dembo-Hoppe Level of Aspiration experiment, 25 measures of mobility, 20 experimental measures of plasticity, high-school grades, and a number of self-report tests. The experiments found consistent between-subject differences in the amplitudes and frequencies in EEG rhythms, evoked potentials, absolute thresholds in visual, auditory, and tactile modalities, strength of excitation and plasticity in auditory and visual modalities, problem solving in deterministic and probabilistic conditions, and the speed of solving problems using a variety of cognitive tests. The Structure of Temperament Questionnaire (STQ, 1989, 1997) assesses temperament using four scales: ergonicity (endurance, the ability to keep intensive work), plasticity (the ability to effectively switch between tasks or to change parameters of performance), activity tempo, and emotionality. We also found that these four temperamental traits are activity-specific and should be analyzed separately in three areas of activity: social, physical and intellectual. A 20-year STQ validation program will be discussed. Temperament is likely to be activity-specific: the dynamic traits of energetic and lability components of behavior should be assessed separately in at least three areas of activity (physical, social-verbal and intellectual).

Keywords: temperament, emotionality, plasticity, performance, ergonicity

Metacognition, personality and dispositional thinking styles

KLEITMAN, S. (University of Sydney), STANKOV, L. (National Institute of Education)

The paper reports the outcomes of two studies in which the test-taking metacognitive processes were assessed. The focus is on confidence judgements that people assign to their answers to cognitive test items. Overall, we pursued two broad aims: (1) to determine the factorial structure which underlies a diverse selection of thinking dispositions, self-concept and personality measures (2) to examine the relationship between those measures, and cognitive and metacognitive factors. An extensive battery of different thinking dispositions/cognitive styles measures relating to the way in which people deal with uncertainty was employed together with measures of personality, self-concept and optimistic/pessimistic outlook. We also assessed several key cognitive and metacognitive constructs involved in cognitive decision-making during test-taking. Pronounced individual differences were observed in confidence judgments defining a broad metacognitive self-confidence factor. Factor Analytic techniques were utilised to provide an integrative model for thinking disposition, personality and self-concept constructs and revealed five broad factors – Need for Structure, Outward Assuredness, Rigid Thinking, Openness and Metacognitive Beliefs. Structural Equation Modelling techniques were used to provide a broad path model summarising the relationship between these, and Gf/Gc cognitive abilities and the Self-confidence factors. The Metacognitive Beliefs factor positively predicted the Self-confidence and two factors that mark Intelligence. In contrast, the Rigid Thinking factor negatively predicted both ability factors. The results suggested that Self-confidence is a genuine psychological trait reflecting metacognitive processes that take place during decision-making involved in test-taking and
shares important links with both, people’s metacognitive beliefs about the quality of their cognitive abilities their actual cognitive abilities. Overall, these results provide a solid basis for our understanding of the nature of key metacognitive processes involved in test-taking.

Keywords: meta-cognition, personality, dispositional thinking styles, self-concept, individual differences

### Chronic illness management: Changing multiple health behaviors

Chair(s): RICIARDELLI, L. (Deakin University)

Discussant(s): RICIARDELLI, L. (Deakin University)

Over the last 10 years chronic illness prevention and management have emerged as critical issues in the health of populations. It is now accepted that the management of chronic illnesses such as diabetes and arthritis requires attention to changing multiple health behaviors such as physical activity and diet (Prochaska, 2008). In this symposium we will: (1) review approaches to chronic illness self management; (2) review the evidence base for interventions that involve changing multiple health behaviors; (3) describe the protocols for our diabetes self-management interventions conducted in Australia and China; (4) report the outcomes from the interventions; and (5) discuss issues in translating chronic illness self-management interventions into different cultural settings. Learning objectives include: To understand approaches to chronic illness self-management; To be aware of the strengths of multiple health behavior change interventions and issues associated with their delivery; To understand the issues in outcome measurement of multiple behavior change interventions; and to be aware of the barriers to translation of chronic illness self management interventions in different cultural settings. The symposium will draw heavily upon research that is currently being conducted in China and Australia in the Happy Life Club initiative. The initiative involves key Chinese clinical agencies in Beijing China and Monash University and the Australian Psychological Society.

### What is chronic illness self-management and does it work?

BROWNING, C. (Monash University)

The aim of this paper is to set the context for chronic illness self-management. The paper
will discuss individual and group approaches, and focus on applications in primary health care settings. The paper is based on a systematic review of the chronic illness self management literature published in the last 10 years that has utilized randomized control trials or systematic review methodologies across key illness groups and health conditions in primary health care settings. The review process utilizes the Cochrane review methodology outlined in the Cochrane Handbook for Systematic Reviews of Interventions (Higgins & Green, 2008). The findings for the major reviews and RCT studies are presented across key different illness groups in primary health care settings. It was found that chronic illness self-management is not universally effective across all illnesses or settings. Care is needed to ensure that the program is effectively designed and implemented in order to maximize successful outcomes.

Keywords: chronic illness, self-management, primary health care settings, Cochrane Handbook for Systematic Reviews of Interventions, illness groups

Outcome measurement in multiple health behaviors

THOMAS, S. (Monash University)

The aim of this paper is to critically review outcome measurement for interventions that involve changing multiple health behaviors. The paper is based on a review of outcome measures and their psychometric and other desirable properties for inclusions in intervention studies targeted at changing multiple health behaviors. First, the differences between outcome, impact, output and process measures are discussed. A framework for assessing the utility of outcome measures is presented including a theoretical discussion of what measurement domains should be included in a measurement suite for this purpose. Engels' bio-psychosocial approach is advocated as a useful model for the selection of appropriate measurement domains within which psychometrically sound measures can be selected. An evidence-based theoretical rationale is provided for the selection and timing of outcome measures for interventions that involve changing multiple health behaviors. The psychometric properties of key measures and the suitability for this purpose are reviewed. Outcome measurement for interventions that involve changing multiple health behaviors requires a sound theoretical approach to ensure that all relevant domains are included as well as careful selection of the best measures from a psychometric viewpoint. Indicative domains and measures drawn from the chronic illness self-management literature are recommended as well as timing of measurement.

Keywords: interventions, health behaviours, Engels' bio-psychosocial approach, psychometrically sound, self-management

The happy life club: Using the trans-theoretical model and motivational interviewing to achieve behavior change.

YANG, H. (Monash University)

The aim of the current study was to describe the Happy Life Club as a model for diabetes self-management in a primary care setting and present outcomes from the intervention. The Happy Life Club was developed by Monash University’s School of Primary Health Care in conjunction with the Australian Psychological Society before being implemented in Beijing. The program’s success there prompted the Chinese Government to name the Happy Life Club its number one showcase health initiative for their 60th anniversary celebrations. The Happy Life Club uses clinical coaches trained in motivational interviewing to support patients with some types of chronic illness to better manage their condition. Twenty-one Beijing health coach clinicians were trained in motivational interviewing and health behavior change principles. The coaches have implemented the program with an initial cohort of 100 clients over a 6-month period. This paper presents the results from the initial trial cohort of 100 clients for the first 6 months. Results from the first 100 clients are presented including at the physical level, a Framingham data set, at the psychological level, a series of measures relating to readiness to change and at the behavioral level, changes in the target health behaviors and in social interaction and behaviors. The results show...
substantial program impact across these domains. The clients will be tracked for 2 years to assess program maintenance and sustainability of effects. We will model individual differences in program effects and sustainability in order to predict program effects and to identify clients with high and low probabilities of success. While the Happy Life program overall is successful, we need to better understand individual differences in outcomes. This paper provides preliminary findings as to outcome prediction for participants in a complex multiple behavior diabetes self-management intervention.

Keywords: Happy Life Club, diabetes, self-management, primary care setting, interventions

The Happy Life Club: Training issues in the translation of behavior change approaches to diabetes management in China using trained clinician coaches.

LINDNER, H. (Australian Psychological Society)

The aim of the current study was to analyze training issues for coaches in the Happy Life Club. 21 Beijing health coach clinicians were trained in motivational interviewing and health behavior change principles using a two-day workshop followed by a one-day workshop conducted in Beijing. The training was subjected to independent formal evaluation by staff from the Peking University using a structured evaluation tool. In addition, the coaches provided feedback in the one-day workshop about their experience of the training and their recommendations for its improvement. Both qualitative and quantitative data have been collected. The training was overall found to be successful but with a range of positive suggestions for improvement made by the participants. Analysis of the quantitative data shows a high degree of acceptance and impact of the training. Many participants described a paradigm shift in their approach to the clinical management of patients with diabetes. These suggestions are subjected to thematic analysis and presented with support from direct verbatim quotations from the participants. A critical analysis of MI training issues for clinicians involved in coaching of health behavior changes is provided. An evaluation framework is presented and implemented.

Keywords: training, health coach clinicians, Happy Life Club, motivational interviewing, behaviour change
Clinical applications of illness perceptions in health settings

Chair(s): PETRIE, K. J. (University of Auckland)

This symposium presents recent application of illness perceptions in health populations. Illness perceptions are the organized cognitive models patients develop about their illness or injury. Previous work has shown that patients' perceptions of their illness predict a number of important health outcomes. The work presented in this symposium shows the broad range of this recent research and how illness perceptions are a valuable way of conceptualizing patients' reaction to illness and have strong relationships with outcome.

Illness beliefs and medication adherence in stroke patients

O’CARROLL, R. (University of Stirling), WHITTAKER, J. (University of Stirling), HAMILTON, B. (University of Stirling), DENNIS, M. (University of Edinburgh), JOHNSTON, M. (University of Aberdeen), SUDLOW, C. (University of Edinburgh)

The aim of the current study was to identify factors which predict poor adherence to secondary preventative medication in stroke survivors. Longitudinal study of 180 ischaemic stroke patients. Time 1 measures were used to predict time 2 adherence, measured 5-6 weeks later. Main outcome measure was patient self-reports of adherence and measurement of urinary salicylate levels. Hierarchical multiple regression analysis tested whether patients' beliefs about their stroke and medication explained additional variance in adherence, over and above that explained by demographic and clinical variables. Self-reported adherence was generally high. The final multiple regression model predicted 24% of the variance in adherence. Three variables made a significant contribution to the prediction of poor adherence: (1) younger age, (2) increased specific concerns about medications and (3) lower perceived benefit of medication. The urinary salicylate assay failed to differentiate between patients taking and not taking aspirin. Interventions to improve adherence could usefully target patients' beliefs (concerns and perceived benefits) about their medication.

Keywords: stroke, medication, longitudinal study, adherence, beliefs

How do illness perceptions influence recovery from cardiac valve surgery?

WEINMAN, J. (Kings College London), HANKINS, M. (Kings College London), RIMINGTON, H. (Guy’s and St Thomas’ NHS Foundation Trust)

Since both illness perceptions (IPs) and depression have been found to influence outcome in cardiac patients, the present study was partly designed to examine possible interactions between patients' cognitions and emotions to gain an understanding of possible causal links between them. Thus its purpose was to assess the extent to which baseline illness perceptions predict subsequent depression, and vice-versa, in recovery from cardiac valve surgery.

Methods: The study sample consisted of 225 patients having first time cardiac valve replacements, with a mean age of 67 years. Each patient's illness perceptions (IPQ-R) and mood (HADS) were assessed by questionnaire immediately pre-surgery and 1 year later. Patients were also assessed for severity (NYHA), ambulation (6 minute walk), cardiac function and quality of life on both occasions. Pearson correlations were used to examine associations between illness perceptions and depression, and structural equation modelling (SEM), using both cross-lagged and reciprocal models, was used to examine the extent to which baseline IPs predicted 1year depression and vice versa. Both IPs and depression predicted one year outcomes. All IPs, except timeline, were concurrently associated with depression pre-op and at 1 year, with consistently stronger associations at one year. The results from the cross-logged and reciprocal models showed that baseline depression is significantly associated with patients’ 1 year perceptions of personal and treatment control as well as their emotional representation of the condition. In contrast, two baseline illness perceptions (perceived
consequences and illness coherence) significantly predicted depression scores at 1 year. These findings therefore indicate which illness perceptions could be targeted to reduce depression and improve one year outcome in cardiac valve surgery patients.

Keywords: illness perceptions, depression, cardiac patients, treatment

Differences between parental and clinical staff perceptions of high-risk newborns and their treatment

PETRIE, K. J. (University of Auckland), BROOKS, S. (University of Auckland), ROWLEY, S. (Newborn Services, Auckland City Hospital), BROADBENT, E. (University of Auckland)

We examined how the perceptions of parents of high-risk newborns concerning their baby’s illness and the effectiveness of the treatment their infants were receiving differed in relation to clinician perceptions and a standard paediatric measure of illness severity. We also examined how these related to the stress reported by parents. Parents of 102 consecutive babies admitted to the high dependency care and neonatal intensive care units at Auckland City Hospital completed illness and treatment perception ratings of their infant’s condition as well as the Perceived Stress Scale on day 3 to 5 days following admission. We also collected Neonatologist ratings and a CRIB-II assessment at this time. We compared parent and clinician ratings as well as the relationship between stress and parental perceptions of their infants’ illness and treatment. Unlike clinician ratings, parents’ illness perceptions of their infants were not significantly correlated with birthweight, gestation or CRIB-II scores. Parents held significantly more negative illness perceptions than clinicians. While clinicians illness perception ratings were significantly different for high dependency and neonatal intensive care infants, parents ratings did not show the same clear distinction. Parental stress was unrelated to objective measures of illness severity. Clinicians should be aware that parents’ views of their infants are likely to be significantly more negative than their own assessments and this may lead to misunderstandings and misinterpretations in communication.

Keywords: high-risk newborns, treatment, illness severity, stress, perceptions

Using illness perception profiles to describe patients’ response to illness

BROADBENT, E. (University of Auckland)

To develop prototypical profiles of illness perceptions for major illness groups to allow individual patient’s responses to be compared. Data was extracted from previous studies of illness perceptions that used the Brief Illness Perception Questionnaire. Profiles of illness perceptions were constructed for different illness groups and within the same illness group across time. Patients who fell outside the norms for specific illnesses were identified using cut-off scores. Illness perception profiles showed significant differences across illnesses suggesting that each type of illness has its own distinctive pattern of illness perceptions. Individuals who fell outside normative ranges differed from the main groups on illness outcomes. Within-group profiles were shown to be sensitive to change across time through the recovery period. The construction of profiles and norms in illness perception research is new and may help with the identification of individuals who may benefit from psychological interventions to improve their adjustment to illness.

Cognitive functioning of children and adolescents after abuse and neglect: A neuropsychological research program

Chair(s): TUCKER, A. (La Trobe University)

Discussant(s): PESTELL, C. (Neurosciences Unit, Department of Health, Western Australia)

Contemporary reviews of child abuse and neglect have concluded that such maltreatment is related to impairments in cognitive development and poor school performance in children and adolescents. Whilst the adverse neuropsychological effects of physical abuse involving the head are well appreciated, there is now a substantial literature indicating that psychological trauma has deleterious effects on brain development and may result in long term consequences for cognition and behaviour. The developing brain is experience dependent, that is, it requires various forms of stimulation to activate neurophysiological processes that promote growth and enhance neuronal connectivity. When these experiences are absent or adverse in nature, the brain’s developmental trajectory may be altered leading to impaired structure and function. This symposium addresses fundamental questions about the nature and extent of cognitive deficits in maltreated children and adolescents and their relationship to theoretical issues of brain development and functioning. The first of the three papers in this symposium describes theoretical and practical aspects of child maltreatment, and reports on a series of children and adolescents who have had neuropsychological assessment as part of a routine clinical assessment. The second paper describes the pattern of major cognitive deficits in a group of maltreated primary school aged children, compared to a matched control group. The third paper describes the cognitive functioning of a group of maltreated adolescents who were admitted to a secure welfare facility. Compared to matched controls, these adolescents had major deficits in a range of cognitive areas. Key learning objectives include: (a) child maltreatment and risk factors for brain development; (b) the pattern and extent of deficits in cognition for maltreated children and adolescents; (c) implications of cognitive deficits for care, clinical services and education.

Brain development, child maltreatment and cognitive functioning in a clinical sample.

TUCKER, A. (La Trobe University)

This paper reviews some key theoretical aspects of brain development through the first two decades of life and describes key risk factors to brain development for children subjected to abuse and/or neglect. Child maltreatment has been associated with poor school performance however the extent and nature of any underlying cognitive deficits is not well documented. This paper describes the nature and extent of cognitive deficits in a sample of children and adolescents referred to a clinical agency. 48 children and adolescents [6-16 years, mean 11.9 years; 37 male, 11 female], referred to the Take Two (therapeutic) service, had individual neuropsychological assessments as part of overall clinical evaluations. These assessments evaluated the child’s overall cognitive functioning (FSIQ), and specific cognitive functions including, visual and verbal memory, visuographic skills, and executive functioning. Scores were compared to normative data. It was found that 16.7% [n = 8] of the sample had FSIQs in the Intellectually Disabled range (FSIQ<70) and a further 37.5% [n = 18] had FSIQs in the Borderline ID range. Examination of the four additional WISC-4 Index scores showed that there were statistically significant differences [at .05 level] in at least one pairwise comparison of Index Scores for 5 of the 8 participants in the ID subgroup, and for 13 of the 18 participants in the Borderline subgroup. Examination of the data for those with an FSIQ in the low average or average ranges [n = 23] showed evidence of unpredicted and markedly lower scores in additional specific cognitive skills including, visuographic ability, visual and/or verbal memory, and executive functioning. This sample of clinic clients had a heterogeneous pattern of cognitive impairment. In a subgroup
the cognitive impairments were very wide ranging and substantial. The complementary subgroup had better overall cognitive resources but many had specific deficits including higher cognitive functions. Deficits in executive functioning may markedly restrict a child’s ability to utilize their cognitive strengths. Whilst this particular sample may reflect the more impaired clientele the deficits here may be attributed, at least in part, to the effects of abuse and neglect on brain development.

Keywords: brain development, risk factors, children, maltreatment, cognitive deficits

A neuropsychological investigation of cognitive outcomes in primary-school aged children with a history of maltreatment.

SCHIRMER, L. (Victoria University)

The aim of this study was to examine the neuropsychological profile of primary-school aged children with a history of maltreatment, in comparison to a group of non-maltreated peers, and to population norms. In particular, it was hypothesized that late developing brain systems, including language and executive control systems, would be impaired relative to controls. 28 six- to eleven-year-old children (22 male, 6 female) with a maltreatment history were compared to a control group of peers, matched for gender and socio-economic status. Maltreatment status was rated according to Barnett and Cicchetti’s Maltreatment Classification System; socio-economic status for each child was based on parent/carer’s occupation and educational status. Children were assessed using a battery of neuropsychological measures assessing general cognitive ability; expressive and receptive language skills; selective, sustained, switching and divided attention; working memory; and a parent/carer rating of everyday executive functioning. The study showed that as predicted, children with a maltreatment history displayed deficits in full-scale IQ and verbal intelligence; but contrary to predictions, deficits were also observed in perceptual reasoning. Effect sizes were large, and children performed on average one standard deviation below population norms. Expressive language was found to be consistently reduced amongst the maltreated group, and there was also a significant difference between groups on the receptive language measure. In addition, children displayed impairments in behavioural-executive skills, and in divided attention. Finally, lower scores were observed relative to controls in working memory abilities. The study suggests a neuropsychological basis for some of the academic and social difficulties encountered by maltreated children. The results support the hypothesis that expressive language and executive abilities are affected by maltreatment.

Keywords: neuropsychological profile, children, maltreatment, language, executive control systems

General and specific cognitive deficits in adolescents with histories of maltreatment.

RUVCESKA, V. (Victoria University)

The aim of this study was to conduct a prospective controlled study of the cognitive profiles of adolescents in short term secure accommodation. Typically, these adolescents have had involvement with child protective services since early childhood, characterized by long histories of severe abuse and neglect. A subset of participants with full scale IQs in the low average range and above (FSIQ >80) were involved in this analysis. A total of 39 participants were recruited from the Secure Welfare Service (SW; Victorian Department of Human Services) and were aged 12-16 years (M = 14.6 years). A control group (n = 43) matched on FSIQ, age, gender and SES was recruited from secondary schools. All participants were assessed on a battery of cognitive tests of, learning and memory, processing speed, executive functioning and attention, language, visuospatial function and perceptual reasoning. Measures of depression and anxiety were also taken. Despite performing comparably to controls on FSIQ, SW participants showed significant impairments in a number of specific cognitive domains. They scored significantly lower than controls on measures of working memory, executive function and attention, learning and memory, visuospatial function and processing speed. This study adds to the multiple lines of evidence which suggest that the experiences of
childhood maltreatment affect brain development, structure and cognitive performance. Theoretically, poor early attachment relationships, the neurotoxicity of stress hormones, direct physical injuries and lack of stimulation during critical periods have all been implicated in the brain changes evident in maltreated children. Under severe circumstances of abuse and neglect, as seen in adolescents who are in secure accommodation, these mechanisms appear to relate to changes in particular brain regions coinciding with specific cognitive impairments. The current study indicates that experiences of severe childhood maltreatment are associated with major cognitive deficits in working memory, executive functioning and attention, learning and memory, visuospatial function and processing speed. This lends weight to the argument that the neurophysiological mechanisms associated with child abuse and neglect alters the developmental sequences of specific brain processes that mediate particular cognitive abilities.

Keywords: cognitive deficits, adolescents, maltreatment, short term secure accommodation, child protection

Collective memory of political and natural events

Chair(s): MULUK, H. (University of Indonesia)
Discussant(s): MALIK, I. (University of Indonesia)

This symposium would address issues of collective memories in the community after experiencing social/political and natural events/disaster such as; earthquake and tsunami. Three studies representing how natural events event were being socially remembered and becoming the collected memories that would impact to the health and resiliency of the communities. Those three studies are chosen from three different countries. One study gives an example how collective memories as it was represented by historical conflict becoming obstacles to peace processes such as; conflict resolution effort or reconciliation. This symposium is intended to explore the way individual memory were intertwined with social memory and becoming represented into various form “collective memories” that would give certain meaning and impact into community life. Implication of these three studies to the communities’ health and resiliency is the ultimate goal of this symposium.

Collective memories of natural disasters

BEDAR, A. (Private consultant), RIDE, A. (University of Queensland, Solomon Islands), DI BRETHERTON, D. (University of Queensland)

The study of memory as an individual cognitive process, necessary for learning, is an important area of psychology. Psychology studies of natural disasters have tended to focus on the negative role played by traumatic memories. This paper sees a largely positive role, with some qualifications, for collective memories as communities adapt to the experience of disaster. As part of a wider international study of community resilience in the face of natural disaster, interviews were conducted after an earthquake in Pakistan. The 10 participants were aid workers, well place to reflect on
individual, community, national and international responses to the earthquake. Interviews were conducted in English or Urdu and transcribed into English. The approach was narrative, encouraging participants to tell their story of the disaster, of their own and other peoples’ responses, and then to reflect on how the disaster has changed the community. A qualitative analysis of the data was conducted. Facing a natural disaster such as an earthquake calls upon the survivor to rapidly make sense of warning signs, seek out further information, try to make sense of the situation and make decision which might have life or death consequences. After the disaster people want to talk about and share their experiences. Repeated storytelling in the community helps people to make sense of their experience and forges social bonds based on facing trouble together. While the stories told serve these positive functions they can also have features which are not adaptive, such as the transmission of stereotypes, the simplistic attribution of blame or the creation of a sense of dependence. Official commemorations of the event start quite quickly after the event, with funerals and religious services. As memories begin to fade anniversaries of the disaster ensure it is remembered. Official written reports of the disaster begin to take precedence over oral accounts and there is some loss of valuable experiential learning and community wisdom. Careful psychological study of community narratives has implications for more effective adaptation to challenging environments.

Collective memories of West-Sumatran earthquake and their relation to community resiliency

EKA PUTRI, D. (University of Indonesia)

Indonesia’s geographical conditions are in the high earthquake-prone that requires a serious effort in disaster mitigation, so that the losses inflicted disasters both physically and psychologically can be minimized. This study aims to find out the positive aspects of experiencing traumatic event in community experiencing natural disasters, in which with these memories helping the community become more resilient. In this study, interviews were conducted after an earthquake in Padang, West Sumatra. The participants were 10 adults, whom experiencing the event directly. Interviews were conducted in Indonesian language. The approach was narrative, encouraging participants to tell their story of the disaster, of their own and other peoples’ responses, and then to reflect on how the disaster has changed the community. A qualitative analysis of the data was conducted. After experiencing the event, people want to talk about their experience and share it to others. This process reveals the effectiveness of powerful kinship, and strengthening social bonds. Facing a natural disaster such as an earthquake increasingly enable religious organizations to participate in giving spiritual support for victims, so that they can accept the event more and continued life, make decision which might have life or death consequences, such as better home construction. Careful psychological study of community narratives has implications for more effective adaptation to challenging environments.

Keywords: natural disasters, resilience, traumatic events, community, adaptation

Collective memories of Acehnese survivors of the 2004 Tsunami

PELUPESSY, D. (University of Indonesia)

The word “trauma” has become part of everyday language, where people talk about experiences as having been “traumatic” or someone having been “traumatized” as a consequence of distressing life events (illness, accident, death, divorce). Apparently, trauma has also dominated discourse on psychological impact of disaster. This study aims to look at beyond trauma, but more on how people recognize the event and conceive it. In-depth interview to 12 participants who experienced near-death experience when the 2004 tsunami struck Aceh region. Among them were aid workers and volunteers, midwife, and housewife. All interviews conducted in Indonesian language. Through a narrative approach, all interviewees shared the stories what happened at the moment of the tsunami, how they and other people responded to it,
and how it remembered by the community. A qualitative analysis of the data was conducted. People make sense what happened differently. They recognized it from many resources. It influences community both in positive and negative ways. Remembrance and commemoration of the event serve as adaptive and process of healing function. Careful psychological study of community narratives has implications for more effective adaptation to challenging environments.

**Keywords:** trauma, distress, natural disasters, healing

**Collective memory and conflict resolution**

TINT, B. (International and Intercultural Conflict Resolution Graduate Program Portland State University)

This paper explores history and memory and their impact on long term, intractable conflict. Memory is strongly connected to narrative, commemoration, identity and emotions and becomes embedded in societies fraught with long term conflict. Conflict resolution literature is explored in terms of how it addresses issues of the past. This paper presents us with a deeper theoretical understanding of these issues and will offer some empirical research in this area and suggest some implications for practice. The empirical research into the study of history, memory and long-term, intractable conflict includes interviews with members of the Israeli and Palestinian communities. A variety of constructs emerge which inform conflict resolution practice. These include a strong orientation to the past, its link to identity, emotion and how past beliefs inform present perceptions. Recommendations are offered for how to integrate historical matter more fully into working with issues of peace and conflict resolution.

**Keywords:** memory, conflict, narrative, identity, conflict resolution

---

**Community psychology applications to organizational and community well-being: Research and action**

Chair(s): PRILLELTENSKY, I. (University of Miami)

This symposium presents findings related to organizational and community well-being interventions in Miami, Florida, and Melbourne, Australia. The projects in both countries follow community psychology principles to advance psychological well-being and social justice. Four community psychology principles underpin the interventions: Strengths, Prevention, Empowerment, and Community Change (SPEC). In this symposium we present a mixed-methods multi-case study of organizational change in human services in Miami, and a coalition building effort in Melbourne. We will present in four papers process and outcome findings from two waves of data collection in years one and two of the Miami project. We then present work based on a multi-agency partnership in Broadmeadows, Melbourne, to promote the development of communities for children. The five presentations will demonstrate the application of the SPEC model to work with community based organizations dedicated to the promotion of psychological well-being of children, families, and communities. The symposium contributes to two main bodies of literature. First, it contributes to the literature on organizational development. Second, it contributes to the literature on community based efforts to promote justice and well-being. With respect to the literature on organizational development, there is ample scholarly work on the generic conditions that lead to healthy organizations, but there is very little research documenting the specific organizational conditions leading to strength-based, preventive, empowering, and community change practices. With respect to the literature on the promotion of social justice and well-being, this research documents the factors inhibiting and enhancing efforts by community
based organizations. The learning objectives are to (1) understand the theory behind the SPEC paradigm; (2) understand the application of the SPEC paradigm in community-based organizations; (3) learn about methods of transformation in community-based organizations; (4) learn how to implement value-based and action research methodologies; (5) learn how to create community coalitions and their challenges.

**Necessary conditions for the promotion of organizational and community transformational practice**

PRILLELTENSKY, I. (University of Miami)

The purpose of this presentation is to introduce a framework for the promotion of justice and well-being in the lives of individuals, organizations, and communities; and to explore the organizational conditions required for transformative practice. We define transformative practice as consisting of Strength, Preventive, Empowering, and Community Change (SPEC) approaches. The SPEC model is conceptualized along four domains: temporal, ecological, participation, and capabilities. The temporal domain refers to the timing of interventions while the ecological domain pertains to the site of interventions, ranging from person-centered to community-centered. The participation domain refers to voice and choice of citizens. The capabilities domain refers to the concentration on either strengths or deficits. Multi-case study, qualitative, action research methodology with ten different health and human service organizations in two cities in the United States. The qualitative data that is the basis of this presentation was gathered through interviews, focus groups, consultations and team reflections over a period of seven years. The findings demonstrate that there are two major sets of conditions required for organizations to engage in transformative practice. The generic set of conditions includes climate-related variables such as how effective, reflective, and affirmative each organization is. A second set of generic conditions includes variables related to human and financial resources. The first set of specific conditions pertains to the level of consciousness of each organization with respect to levels of analysis of problems, and to issues of injustice and power differentials. The second set of specific conditions leading to transformative practice entails support and legitimacy from leadership, boards, and funding agencies. The model is a useful pedagogical tool for the transformation of community-based organizations. For the model to be effective, organizations must be ready to engage in serious work and invest in the creation of an affirmative, effective, and reflective environment.

Keywords: justice, well-being, transformative practice, strengths, community change

**Organizational interventions to promote community well-being: Program evaluation of the Miami SPEC project**

MCKENZIE, A. (University of Miami)

The purpose of this presentation is to evaluate the process and the preliminary outcomes of a project designed to promote Strengths, Prevention, Empowerment, and Community Change (SPEC) in the work of five health and human service organizations in Miami, Florida. The name of the project is Miami SPEC: Learning and Changing by Doing. The intervention with five organizations in Miami consists of five components: training, team development, consultation, professional development, and action research. Qualitative and quantitative methods are used to evaluate the interventions. Findings demonstrate that the intervention is having an impact in the way organizations think about social problems and the means they use to address them. It is clear from the data that organizational readiness has an impact on the pace and degree of progress towards SPEC practice. In addition, it is also clear that certain conditions must prevail within the organization prior to the practice of SPEC in the community. The significance of this work lies in the methodic implementation and evaluation of an intervention designed to make organizations more effective in their aspirations to promote justice and well-being. Despite aspirations to become agents of social change, many community organizations perpetuate the status quo by focusing on deficits and on reactive, disempowering, and individualistic approaches. This work goes...
Beyond declarations of intent to pursue social justice. This intervention tries to actually change how organizations do their work in order to align them better with their visions of social justice.

Keywords: strengths, prevention, empowerment, community change, social justice

The meaning and practice of Strengths, Prevention, Empowerment and Community Change (SPEC)

PRILLELTENSKY, O. (University of Miami)

The purpose of this paper is to describe the meaning and the practice of SPEC in five community based organizations. Data derive from qualitative and quantitative data collection with five educational, community, and human service organizations in Miami. It is evident from the data that individuals and organizations as a whole hold multiple, and at times contradictory meanings of the four concepts of SPEC. Similarly, results show that there are continua of meanings and implementation of SPEC. Whereas some organizations impose a rigorous definition of client empowerment, such as consumer representation on boards, others adopt a more lenient definition of empowerment, such as having clients fill out a customer satisfaction survey. An appreciation for the diverse perspectives and practices of organizations is required in order to align organizations better with a mission of justice and well-being. This study begins to show the multiple interpretive and implementation frameworks that organizations employ in their work. This understanding precedes effective organizational change.

Keywords: strengths, prevention, empowerment, community change, well-being

SPEC Check: A deliberative approach to quantifying alignment with SPEC (Strengths, Prevention, Empowerment and Community Change) principles in community based organizations.

EVANS, S. (University of Miami)

To present a methodology designed to assess alignment of community based organizations with SPEC principles and findings from the current study. We conducted structured group interviews on-site at the various organizations participating in the parent project. Similar to other collaborative approaches such as Empowerment Evaluation (Fetterman, 1994; Fetterman & Wandersman, 2005), the process combines individual reflection and scoring with group dialogue and consensus. We first have program personnel complete the short SPEC Check questionnaire on their own. The eight question SPEC Check questionnaire is modeled after the organizational culture inventory developed by Cameron & Quinn (2005). Participants are asked to divide 100 points between two “competing values” in each of the four SPEC domains. Early analyses suggest that the SPEC check tool and process provides a useful structure for organizational program personnel to reflect on their work. We have learned that each member of a given program may see the program in a different way, and the structured process helps them to build a shared understanding of program goals and actions. Each organization received a spider diagram of their SPEC alignment weighted by program dollar allocation, and participants decide together if the balance is consistent with their stated mission and values. Depending on the program, there are different levels of alignment with each domain of SPEC. However, this research provides us with concrete examples of how staff, teams, and entire organizations frame each of the four SPEC constructs and how these values are applicable to their work. One thing that we have heard loud and clear in this project is that community-based human service organizations do not take the time, or do not have the time, to reflect meaningfully on the process and outcomes of their programs. The SPEC Check process affords organizations this opportunity and gives them useful data that can inform action.

Keywords: strengths, prevention, empowerment, community change, well-being

Building a community for children: A multi-agency partnership in a Melbourne
TURNER, C. (Broadmeadows Care)

The purpose of this presentation is to track community services agencies working together, over a period of five years for a common purpose. Partnerships develop the strengths of a local service system, and empower the local community, which includes service providers, to work together for positive community change for families and young children. The Final Evaluation of the Communities for Children project uses an outcomes framework to consider nine key outcomes over a three year period. The framework considers progress towards outcomes for children, for families and for the community. Data was collected from 35 community projects and twenty five community agencies across three years. Data included partnership information, longitudinal information from families and qualitative journals from professionals implementing the projects. The large scale project was able to actively engage families with young children (0-6 years) to take part in social and educational activities for themselves and their children. A smaller scale longitudinal study embedded in the larger evaluation found that both parents and children had improved their social connectedness and that improvement was maintained for parents and continued to improve for parents over a three year period. The partnership also improved its range and depth over that period. It took on a larger geographic area and began to act as the strategic planning body for Children’s services within the local Government area. The process of developing a planning and advocacy body has challenged the Early Years Partnership to improve its focus on community strengths, empowerment, prevention (a particularly important principle and process for young children), and community change. The process is neither static nor complete. The SPEC principles are used within the partnership agencies to recognize each other’s strengths and to use those strengths to support community change, family change and improved social and educational results for children.

Co-morbidity between emotional and physical health: Developing early identification strategies

Chair(s): CALTABIANO, M. (James Cook University)

Discussant(s): CALTABIANO, M. (James Cook University)

Depression and other negative aspects of emotional health are often found to co-occur in individuals who have a chronic illness and other health problems, including those diagnosed with a substance use disorder. In order to develop effective models of care for patient groups with co-morbid depression, we need to first identify and understand the needs and challenges experienced by these individuals. The present symposium examines the nature and the predictors of emotional health problems among individuals in four different health contexts. In addition, the symposium highlights the need to develop early identification strategies that effectively screen for and manage these problems. The first paper examines demographic, medical, and psychological predictors of quality of life among young people with epilepsy. The main predictors of quality of life were depression and anxiety. The second paper focuses on coping resources, depression, exercise and diet as predictors of mental and physical health status among adults with a chronic illness. Poorer coping resources and depression predicted worse mental health, and depression predicted worse physical health. The third paper evaluates the importance of screening for mood disturbance in stem cell transplant (SCT) patients. Given that many SCT patients experience clinically elevated levels of distress, it is essential that these are screened for pre, during and post treatment. Patients were most at risk of 2 days prior to discharge and the most significant predictor of adjustment at 4 months was lower distress, especially depression at admission. The last paper examines the clinical profile, physical health, and family and social relationships of clients...
Co-morbid depression and chronic illness related to coping and physical and mental health status

DI BENEDETTO, M. (University of Ballarat)

The aim of the current study was to evaluate the influence of coping resources, depression, diet and exercise on mental and physical health status. A partial latent structural regression analysis was used in a sample of 113 participants (59 females and 54 males) with a mean age of 59.38 years ($SD = 10.52$). Coping resources, depression, and exercise explained 52% and 26% of the variance in mental and physical health status, respectively. Fewer coping resources predicted higher levels of depression and both predicted worse mental health. Only higher levels of depression predicted worse physical health status. There were also significant indirect effects of coping on mental and physical health status through depression. Fewer coping resources predicted higher levels of depression. These results highlight the important role of psychological factors in the care of individuals with chronic illness. The development of cognitive, social and emotional coping strategies is important for managing depression and supporting positive mental health. Additionally, the management of depression is important in maintaining positive physical health.

Psychological screening and prediction of distress in Stem Cell Transplant patients: A longitudinal study

HORNE, D. (University of Birmingham), EGGEN, J. (University of Birmingham), CRADDOCK, C. (University of Birmingham), HOWARD, R. (University of Birmingham)

Many stem cell transplantation (SCT) patients suffer from clinically elevated levels of distress which may persist after treatment ends. Identification of factors that predict post-treatment maladjustment is useful for targeted screening and individualised psychological interventions. The aim of the current longitudinal study was to identify the extent to which pre-treatment psychological variables

---

diagnosed with depression and/or anxiety and substance use disorders. The majority of clients had at least two mental health problems and was highly troubled by their health and family problems. Recommendations for developing and implementing early identification strategies will be discussed.

Anxiety and depression as best predictors of quality of life for young people with epilepsy

CLARKE, A. (Optimal Health and Performance), CHRITCHLEY, C. (Swinburne University of Technology)

The aim of our study was to assess the Health Related Quality of Life (HRQOL) of young people with epilepsy. A total of 114 young people (35.1% male), ranging in age from 10 to 24 years with a mean age of 17.92 years ($SD = 3.90$), completed a paper (60.5%) or Internet survey (39.5%) that included demographic, medical and psychosocial questions. The survey included: demographic and medical history questionnaires, Quality of Life in Epilepsy for Adolescents Scale (QOLIE-AD-48), the Family Assessment Device (FAD-GF), Adolescent Coping Scale (ACS-SF) and Hospital and Anxiety Scale (HADS). The young people were mainly recruited from community support groups in each state of Australia and New Zealand, neurologists who specialize in treating epilepsy, and Internet support groups. Using multiple regression, demographic, medical and psychological variables were used to predict quality of life. Together the variables explained 47.8% of the variance, with only higher depression (Beta = -3.06) and anxiety scores (Beta = -2.93) significantly predicting lower HRQOL. Gender, age, duration and severity of illness, family functioning, and coping style were not significantly associated with HRQOL. In addition to seizure management, clinicians can promote better quality of life for young people with epilepsy by actively screening and managing anxiety and depression symptoms.

Keywords: anxiety, depression, health related quality of life, epilepsy, adolescents

Psychological screening and prediction of distress in Stem Cell Transplant patients: A longitudinal study

HORNE, D. (University of Birmingham), EGGEN, J. (University of Birmingham), CRADDOCK, C. (University of Birmingham), HOWARD, R. (University of Birmingham)

Many stem cell transplantation (SCT) patients suffer from clinically elevated levels of distress which may persist after treatment ends. Identification of factors that predict post-treatment maladjustment is useful for targeted screening and individualised psychological interventions. The aim of the current longitudinal study was to identify the extent to which pre-treatment psychological variables
predict distress during and post SCT treatment. 62 participants undergoing SCT completed questionnaires upon admission, 2 days prior to discharge, 1 week post discharge, at first outpatient appointment, and 4 months post-transplant. Psychological assessment involved the use of validated self-report instruments assessing depression and anxiety (HADS) and mood disturbances and fatigue (POMS). Depression, anxiety and mood disturbance peaked post-treatment prior to discharge, at which time 63% of the patients reported clinically elevated levels of depression and 29% reported clinically elevated levels of anxiety. At 4 months post-treatment these percentages were 23% and 17% respectively. The most significant predictor of adjustment at 4 months was lower distress, especially depression at admission. This study shows that psychological assessment of SCT patients using simple standardised questionnaires provides reliable data about patients’ levels of distress (anxiety, fatigue and depression) at time of admission. This early assessment provides reliable prediction of distress during and after SCT. These findings have implications for psychological intervention at all stages of SCT, pre, during and post treatment. Special attention needs to be paid to patient levels of depression and fatigue.

The clinical profile and needs of clients diagnosed with substance use and depression and/or anxiety problems

RICCIARDELLI, L. (Deakin University), STAIGER, P. (Deakin University)

The aim of the study was to detail the background characteristics, clinical profile, physical health, and family and social relationships of clients diagnosed with co-morbid high prevalence mental health (HPMP; i.e., depression and/or anxiety) and substance use disorders. 49 males and 36 females from two Alcohol and Other Drug (AOD) units in a larger outpatient metropolitan service completed clinical interviews and self-report measures. Assessed were demographics; mood, anxiety and alcohol/substance use disorders; personality and post traumatic stress disorders; physical health; and family/social relationships and other main sources of social support. Clients had limited physical and social resources, and complex clinical profiles: 52.9% had not completed high school; 88.1% were on welfare benefits; 67.1% had at least two substance use disorders; 71.8% had two mental health disorders; 77.0% had four or more personality disorders, and 40.7% scored above the cutoff indicative of post traumatic stress disorder. In addition, 40.8% of males and 66.7% of females were highly troubled by their medical problems, 41.7% of males and 48.6% of females were troubled by their family problems, and 51.0% of males and 69.4% of females relied on organizations for their main source of social support. These finding highlight the far ranging clinical, health and social needs of clients with a dual diagnosis; and the need to develop early identification strategies that effectively screen for and manage these diverse issues.

Constructivist approaches to career counselling

Chair(s): MCMAHON, M. (The University of Queensland)
Discussant(s): SAVICKAS, M. (North Eastern Ohio Universities College of Medicine)

Career counselling has a long history. In recent years it has received increasing influence from constructivism, and several approaches to constructivist career counselling have been advanced. Constructivism may be regarded as a way of thinking, a set of values, or a philosophical position that may be internalised and applied by career counsellors. Common to constructivist approaches to career counselling are constructs such as agency, meaning making, and connectedness. Further, such approaches place value on the client counsellor relationship, subjectivity and the place of emotion. Despite their increasing popularity and intuitive appeal as a way of working with clients, constructivist approaches to career counselling tend to be developed and understood at a theoretical level more than at a practical level. Indeed, prescriptive approaches, sets of techniques or interview sequences are not consistent with constructivism. Career counselling in general, and constructivist career counselling specifically, has received less research attention than other aspects of the career field and there remains a gap between theory, practice and research. There is evidence that this situation is being redressed through research being undertaken in several countries. The purpose of this symposium is to present research programs from five countries dedicated to developing a better understanding of constructivist approaches to career counselling. The key learning objectives of this symposium are to: (1) develop an understanding of a range of constructivist approaches to career counselling; (2) identify constructs common to constructivist approaches to career counselling; (3) develop an understanding of research methodologies investigating constructivist approaches to career counselling; (4) consider issues and challenges facing research into constructivist approaches to career counselling.

Identity construction and career development interventions with adolescents and emerging adults

The aims are to outline a theoretical approach to identity construction, to present empirical observations made in adolescents and emerging adults, and to describe some career development interventions (education and counselling) designed in this framework. A “self-constructing” model will be outlined. Referring to the constructivist and social constructionist epistemologies, this approach to identity construction describes self-construction as a dynamic system of (past, present and anticipated) subjective identity forms (SIF). A SIF is defined as sets of ways of being, acting and interacting in relation to a certain view of oneself in a given context. The synthesis and the dynamism of this system originate in a tension between two kinds of reflexivity anchored in certain views of self in the future. The first one is a stabilizing factor (a wanting to become like this person or persona, opposed to a rejection of others). The second kind of reflexivity is a sense-making process during which individuals reflect upon the multiple possible interpretations of their past and present commitments and those they anticipate. It leads towards a never-ending self-analysis. Empirical observations made with adolescents and emerging adults show the construction and deconstruction processes of their self-anticipations in vocational figures as well as the development of some meta-reflexion processes involved in the second kind of reflexivity. Interventions methods aim to help people develop a critical sense of self, anchored in some flexible self-anticipations, that allow them to either see and grasp certain opportunities afforded by the different settings where they interact or create new ones. Such a constructivist/constructivist approach seems promising in the fields of both research and interventions. Nevertheless these
interventions are (to name them in Foucault’s words) technologies of the self aiming at the government of self. Is such an aim sufficient to help people cope with the world’s crises we have been experiencing over the last few decades?

Creating a research agenda in career counselling: The place of action theory

YOUNG, R. (University of British Columbia), DOMENE, J. (University of New Brunswick)

The purpose of this presentation is to introduce a conceptual model and research method as the basis for a research agenda in career counselling. While there is substantial research literature in the career field generally, there has been relatively little focus on the career counselling process. The perennial problem of the separation of research and practice may be one contributing factor to this dearth. Building on a systematic review of the literature in career counselling and related areas, we identify salient current issues in the discipline, and frame these issues from the action theoretical perspective to formulate the research agenda. The method also involves a review of the existing literature on action theory and its associated action-project research method. Results of the review reveal that, for over a decade, contextual action theory has been put forward and used as a framework for research in the career field as well as for general counselling practice. A corresponding research method, the action-project method has been developed and used. However, it has only recently been applied to research on the career counselling process. The advantages of using contextual action theory for this purpose include its conceptual basis, its sophisticated qualitative and quantitative research method, and the significant link it provides between research and practice. In this presentation we address how contextual action theory and the action-project method are advantageous in addressing the major issues in the career counselling field, for example, the place of emotion and the use of narrative, and propose a specific agenda to address them.

‘Telling tales’: Do narrative approaches for career counselling count?

REID, H. (Canterbury Christ Church University)

The aim of the paper will be to question the usefulness of using narrative approaches to career counselling. By drawing on a current research project (developed by the author and a colleague, Dr Linden West) the paper will argue for the importance of narrative and autobiographical-based approaches in career and educational counselling. The development of such work provides an opportunity to offer a more meaningful, ethical and sustainable approach to career counselling – for all involved. However, the paper will also discuss the wisdom of ‘mining’ from therapeutic counselling and using such techniques within an eclectic approach to career counselling. The research is autobiographical, working collaboratively with a group of eight practitioners to develop approaches and then to apply and evaluate techniques and strategies within the context of their work. This is a work in progress, but initial analysis of the work with clients has highlighted the potential usefulness of the approach, but has indicated a number of epistemological and political tensions derived from the working culture of career and educational counsellors (and researchers) in the UK. The paper will raise these affective issues for discussion. The analysis has confirmed the power of narrative approaches to help clients construct ideas about self and career futures in ways that are more personally meaningful. But it is hard work for practitioners and not all of the group have continued to use a new approach – why? The research is now in its second phase; where the autobiographical resonances of the work are being explored. Findings will be discussed.

Keywords: career counselling, narrative approaches, educational counselling, therapeutic counselling, autobiographical-based approaches

A story telling approach to career counselling: Key constructs examined
Despite the intuitive appeal and increasing influence of constructivist approaches to career counselling, the ‘how to’ of implementing such approaches is not well understood. The aim of the paper is to examine how the constructs of reflection, connectedness, meaning making, learning and agency are operationalised in a constructivist approach to career counselling, specifically the story telling approach. Theoretically guided by systems theory and the story telling approach to career counselling, a series of career counselling interviews was conducted with Black South African women. Interviews were recorded and transcribed. A coding system based on the constructs of reflection, connectedness, meaning making, learning and agency was specifically developed for the research project and facilitated thematic analysis of the interviews. A detailed description of the development of the coding system will be provided. The results provide examples of a) how career counsellors enact the constructs of reflection, connectedness, meaning making, learning and agency and facilitate the development of these constructs in their clients, and b) how clients operationalise these constructs in their dialogue with career counsellors and in their actions. Illustrative examples of client dialogue, counsellor dialogue and interview process are provided. The results also provide some evidence of the cross-cultural applicability of constructivist approaches to career counselling. The study provides insight into the conduct of career counselling informed by constructivism from which tentative suggestions about facilitating the constructs of reflection, connectedness, meaning making, learning and agency may be made. Such suggestions may be of practical use to practitioners and counsellor educators interested in using and promoting constructivist approaches to career counselling.

Contemporary use of simulation in road safety - Part 1

Chair(s): LENNÉ, M. (Monash University Accident Research Centre)

Discussant(s): SUMMALA, H. (University of Helsinki)

With advances in technology simulators have become more affordable and are being used by an increasing number of researchers worldwide. This double symposium will showcase a sample of the latest experimental research that uses driving simulation. The topics proposed will provide ICAP attendees with knowledge on key principles of simulation research with practical examples. For example, key issues of scenario design and performance measurement, including the analysis of eye movements, are core themes across the presentations. The presenters are recognised as international leaders in simulation research, and the program assembled draws upon experts from Australia, Canada, Finland, Sweden, France, New Zealand and the UK.

Five practical and useful questions about driving simulation

CAIRD, J. K. (University of Calgary), HORREY, W. (Liberty Mutual Research Institute for Safety)

A number of common practical questions or concerns are frequently expressed about driving simulators. Probably the most important question though is whether driver behavior in a simulator mimics that which is exhibited while driving in the real world. This and four other epistemological questions will be discussed. Research synthesis and analytic approaches are used to address each of the five questions: 1) What are the origins of driving simulation? 2) When using driving simulators, what special considerations should be discussed when applying to an ethics committee or institutional review board (IRB)? 3) What dependent variables can be collected using a driving simulator? 4) To what degree are the results from a simulator similar to
those measured in the real world? 5) How well do the results from simulator, on-road and more basic laboratory studies correspond with one another? The results showed: 1) The earliest citation of a system that resembled simulated driving appeared in the journal The Human Factor in 1934 (Miles & Vincent); 2) A typical list of issues that needs to be addressed when an ethics application is submitted includes: informed consent, consent to use participant image, negative transfer, simulator sickness, parental consent (if needed), screening criteria, recruiting procedures, questionnaires, experimental script or verbal protocol, payment, and debriefing; 3) The choice of dependent variables is made based on the questions being asked; 4) This multi-level correspondence problem has broadly been called simulation validation, which has been defined as the replication of simulator and on-road tests to determine the extent that measures correspond across contexts; and 5) A number of recent studies have sought to statistically compare results arising from different methods, which are discussed. How simulators are used by researchers can result in high quality research or results that are open to criticism. Threats to internal and external validity in driving simulation can, in part, be addressed by attention to a number of methodological details. Future research with driving simulators should make a difference and address important gaps in knowledge such as understanding why and how drivers are killed and injured and determining if safety countermeasures are effective.

Keywords: driving simulation, simulators, ethics

Examining the potential of modern driving simulation for enhancing human performance research

TRIGGS, T. (Monash University Accident Research Centre), LENné, M. (Monash University Accident Research Centre)

Over the last forty years there has been an explosion of capability in the technical aspects of driving simulation. As a consequence, the use of simulation in human factors studies has become widespread. Investigators have used the enhanced capabilities to conduct studies in a wide range of driving environments and scenarios while collecting data for a range of dependent variables. While much excellent work has been done, the issue remains as to whether driving simulation research has contributed substantially in new ways to human factors psychology. While simulation has been used to study performance in operational environments, it can be argued that much of the work that has been done has used simulation basically as an extension of the traditional experimental psychology laboratory. Does simulation provide a special opportunity for furthering human performance theory? In addressing this question here, we will consider how simulation might be used to promote such development. An overview will be provided of the progress that has been achieved in terms of theoretical development as opposed to the answering of applied issues from the use of simulation. As highlighted by Norman Anderson, the areas of theory and measurement are closely intertwined, so we will then consider how the use of a range of measures can contribute to basic theory questions. Concepts developed by Egon Brunswick, bearing on ecological validity and representative design, are relevant to the fact that simulation potentially allows flexibility in human performance. Meaningful removal of constraints on human performance is made possible by the use of simulation. Such considerations also bear on the question of how the level of simulation realism available can affect the type of research issue that can be explored. It will be argued that further developments in human factors methodology are needed to better exploit the true capability of modern simulation. Important issues here are task requirements, databases/scenarios, experimental measures, data analysis techniques, and procedures for integrating the outputs from various measures. Additionally, we will identify some modelling areas that are likely to benefit from the use of simulation. Areas to be considered will include trade-offs models, resource theory, expectancy theory and calibration.

Hazard perception by road and by simulator

179 | Symposia
UNDERWOOD, G. (University of Nottingham),
CRUNDALL, D. (University of Nottingham),
CHAPMAN, P. (University of Nottingham)

How should we assess the comparability of driving on a road and “driving” in a simulator? If similar patterns of behaviour are observed, with similar differences between individuals, then we can conclude that driving in the simulator will deliver representative results and the advantages of simulators (controlled environments, hazardous situations) can be appreciated. In the present study we compare hazard detection while driving on roads, while watching short film clips recorded from a vehicle moving through traffic, and while driving through a simulated city in a fully instrumented simulator with a 90 degree forward view (plus mirrors) that is under the speed/direction control of the driver. In all three tasks the primary measures of visual attention involved the recording of drivers’ eye movements, and of particular interest were differences in scanning and hazard detection between drivers with differing amounts of experience. On real roads it is not possible to create sudden hazards for clear ethical reasons, and so we relied on the extent of visual scanning as a measure of hazard detection. The rationale here is that drivers who are looking around them are looking for events to which they may have to respond. The laboratory method with video clips has been well documented elsewhere, and involves the detection of hazardous events in short movie clips recorded from a vehicle moving through traffic. A hazard is defined here as any event on the roadway that would cause a driver to take evasive action, including changing direction or braking. The responses to these movies are now part of the driver testing and licensing process in a number of countries, including the UK. In a simulated environment hazards can be introduced that correspond to those filmed for the hazard detection task, with other (simulated) road users changing direction suddenly, or moving into the path of the driver. In all three situations we find increased scanning by more experienced and especially professional drivers, and earlier eye fixations on hazardous objects for experienced drivers. This comparability encourages the use of simulators in drivers training and testing.

Driving simulators in product development and assessment

NILSON, L. (VTI)

ViP (Virtual Prototyping and Assessment by Simulation; www.vipsimulation.se) is a Swedish centre of excellence for development and application of driving simulator methodology focusing on the interaction between humans and technology (HMI). The centre aims at establishing a national platform for extended co-operation, competence development and knowledge transfer in the field of real-time simulation of vehicles and infrastructure. Collaboration with national and international actors outside the centre is foreseen. The goal is to be one decade in advance, to explore and develop future vehicles and traffic environments by today enabling the study of real drivers driving future vehicles in future traffic using simulated vehicles and a virtual surrounding world. To reach more prospective and efficient (costs, lead times) innovation, product development and assessment by driving simulators, as well as to keep Sweden in the international front-edge, ViP combines three approaches: (1) Co-ordination and development of a common technical framework for driving simulators (hard and software modules, interfaces, protocols, models; compatibility); (2) Development and use of a common simulator-based methodology framework (methods, procedures, indicators, analysis); (3) Concrete applications (projects) as basic activities. The integration of technical/methodology development and application is realised through mutual and iterative exchange of knowledge and experiences. Today 17 projects are ongoing within ViP and the 12 partners represent vehicle manufacturers, road administration, SME, and the research community.

Keywords: driving simulation, innovation, humans and technology

Putting training in motion: The importance of motion fidelity for simulation-based vehicle operator and crew training in the military
Motion fidelity refers to the extent to which any motion-induced forces experienced in the training environment reflect those experienced in the actual environment. The importance of providing motion within simulation-based driver and co-driver training remains a moot issue, with the literature available being both vague and dated. Notwithstanding this, recent research has identified motion fidelity as a fundamental training system design issue in the context of military vehicle operator and crew training. The aim of this research was to explore the importance of providing high levels of motion fidelity in the context of military simulation-based land combat vehicle operator and crew battle management system training. The Monash University Accident Research Centre’s (MUARC) advanced driving simulator was used to conduct an experiment focusing on the effects of motion on the use of in-vehicle battle management systems during driving tasks. Participant teams, consisting of drivers and co-drivers, completed two drives, one with a high degree of motion fidelity and one without motion, whilst undertaking a route planning and navigation task. Driving performance, teamwork, workload and task performance measures were taken. The results will be discussed in detail in the full conference paper; however, preliminary findings suggest that, in the context of military training at least, motion fidelity is likely to be a key consideration in training system design. Whilst the majority of the literature available is skeptical regarding the benefits of motion fidelity over and above enhanced physical fidelity, this research indicates that, if motion is a cue required to perform a particular task, then careful consideration must be given to implementing high motion fidelity within the training system itself.

Keywords: motion fidelity, military, simulation, training
on driver performance. Two candidate interface designs had already been developed based on established ergonomics techniques and best practice. These were installed and linked up with the Brunel University Driving Simulator to provide dynamic driving feedback, using outputs from the simulator’s real-time data stream. Combined with a baseline driving condition, there were three levels of the independent variable for interface design (none, interface 1, interface 2). A second independent variable examined road type, with two levels: urban and extra-urban. Twenty-five participants drove each of these conditions in a counterbalanced repeated-measures design. Dependent variables covered objective measures of driving performance and workload, and subjective metrics of usability and mental workload. There were mixed results in terms of choosing between the interface designs. Some of the objective data favoured interface 1, in terms of the desired driving behaviours. Factors such as the number of excessive acceleration events and speeding violations were reduced for interface 1. But closer inspection of the data suggests these results are not so clear-cut. Meanwhile, a secondary task to measure objective mental workload revealed that interface 2 was least demanding, and this finding was echoed in the subjective workload data. Subjective usability ratings also favoured interface 2. It was difficult to be conclusive about which interface design was preferred based on the results of this study. However, since the simulator experiments were intended to be a filtering stage in the wider human-centred design process, a choice was made based on the workload and subjective data in favour of interface 2. This choice was justified on the basis that both interfaces in fact demonstrated superior performance over baseline driving, and that one of our key objectives was to minimise driver distraction from the display. Although the on-road trials are yet to occur at the time of writing, the paper will discuss the role of the simulator tests in the wider context of the project.

Keywords: Foot-LITE, driving behaviour, distraction, driver performance

Driving without awareness: Insights into the unconscious driver

The sense of driving without awareness is an experience familiar to most drivers; a sudden realisation that you have no recollection of the past several minutes of driving, and that you have arrived at this point in the journey with little or no conscious attention to the surrounding traffic. As with many other areas of skilled performance, most aspects of driving become automated with practice. While the role of automaticity in skilled performance has been of interest to experimental psychologists for many years, little is known about the progression of automisation in driving tasks, and the timing and frequency with which drivers switch their attention between operating and monitoring processes. This research examined the development and maintenance of automatic driving habits in a high-fidelity driving simulator by maintaining a cohort of participants paid to drive a simulated road regularly over 12 weeks of testing. The simulated road created for this study was a 24 km-long section of rural road based on the surveyed 3-dimensional road geometry of a two-lane state highway in New Zealand. During each session, participants took two “trips” on the simulated road; sometimes travelling on a “to and from” journey on one half of the road, sometimes traversing the entire road in one direction. A range of measures, including driving performance, detection task performance, and eye-blink rate, were collected over the course of 24 sessions. The data show the development of stereotyped action patterns and declines in object detection performance indicative of proceduralised “driving without awareness”. This longitudinal research paradigm is a significant departure from previous studies, which have only examined drivers in a conscious (top-down) attentional mode using short, hour-long experimental sessions or cross-sectional designs comparing expert and novice performance. The changes in attentional focus and driving performance over time provide new light on a range of previous research findings and have prompted us to critically re-examine several established models of driving behaviour including the Risk
Training non-technical skills in young driver teams: Training program development and simulator-based evaluation

LENNÉ, M. (Monash University Accident Research Centre), LIU, C. C. (Monash University Accident Research Centre), WILLIAMSON, A. R. (Monash University Accident Research Centre), HOLDEN, M. (Monash University), MOSS, S. (Monash University)

Communication-based training programs have proven to enhance team performance in many settings, but have not yet been tested in a road safety setting. The purpose of the present study was to evaluate a pilot program to teach communication skills to young drivers and passengers. Data were collected from 62 young male drivers. Half of the participants were randomly allocated to attend a two-hour training session. The trained group participated in a two-hour facilitated discussion session, which was led by experienced facilitators. The training session emphasised ideas such as the risks involved in driving, the responsibilities of drivers and passengers, and various strategies for effective communication in a vehicle. In the simulator, participants were tested in pairs (all pairs were friends). Trained participants drove more safely in the simulator as measured by speed and reaction times to detect hazardous events. Trained groups also exhibited more safe communication than did untrained participants. There were also differences in real-world driving behaviour, as revealed by use of the Driver Behaviour Questionnaire developed by James Reason. In particular, a greater number of trained participants reported reductions in the frequency of mistakes and violations. The present results reveal an alternative view of adolescent passengers: rather than being a negative influence on drivers, adolescent passengers may be trained to become a positive influence. Nonetheless, the present results do not diminish the importance of continued supervision of young drivers, including the enforcement of passenger restrictions.

Simulation research for Powered Two Wheelers (PTW): Research challenges and progress

ESPIÉ, S. (INRETS)

Current statistics show that Powered Two Wheeler (PTW) users are over-involved in fatal crashes. The risk to be killed in an accident is about 24 times higher using a PTW than using a car. The disproportionately high rate of motorcycle-related deaths and injuries stems primarily from riders’ and drivers’ errors. While car driver behaviour has been studied in depth for more than 20 years, very few efforts have been made for PTW riders. Understanding the motives that underlie PTW riders’ decision process is, however, the basis for designing relevant and efficient countermeasures. Despite their numerous limitations car driving simulators are now commonly used to investigate driver behaviours. Used carefully, and by researchers aware of the limits of the technology and of the question of the transferability of data acquired using this tool, driving simulators are quite relevant. There is now a market for car driving simulators, and several companies sell “off the shelf” products. PTW riding simulation is much more challenging and less advanced than car driving simulation. The dynamics are more complex, and contact with external elements such as wind and rain is fairly impossible to recreate. There are still very few riding simulator prototypes and they each have a limited domain of validity. At INRETS we conduct research on a PTW riding simulator prototype dedicated to PTW riders’ behaviours. This prototype is enhanced iteratively and used for studies. In this paper we will first present information on existing riding simulators. We will then describe the INRETS PTW riding simulator and its current status. We will then discuss its use to study various IVIS systems within the framework of a European research project. Finally, we will discuss the future of such a tool and the way we plan to use what
we learned designing this prototype to design next generations of PTW riding simulators.

Counselling international students: New directions for practice and research

Chair(s): ARTHUR, N. (University of Calgary)

Discussant(s): MCMAHON, M. (Queensland University)

The mobility of students between nations provides unprecedented opportunities for academic and cultural learning. Counsellors need to be informed about international student transitions and be prepared to deliver relevant interventions. In this symposium, we intend to expand dialogue about the nature and scope of international student transitions, and emphasize theoretical perspectives that inform both research and practice. This symposium will target the following learning objectives: (1) Examine key aspects of international student transition experiences; (2) Review concepts that counsellors may use to understand and appreciate the nuances of international students’ transition experiences; (3) Present original research and a synthesis of research perspectives evident in the literature; (4) Outline guidelines for strengthening counselling approaches to service provision; and (5) Provide recommendations and directions for future research. The first presenter will provide an overview of the research pertaining to counselling international students. This presentation will identify gaps in the literature related to the client, the therapist, the process, and the outcome. The first presenter will also highlight selected concepts for understanding three phases of international student transitions. In the second paper, the presenter will discuss original research on international student successes and failures. Her emphasis on interpersonal relations will demonstrate the integral connections between the academic and social realms of international student experiences. The third paper focuses on the latter stage of cross-cultural transition and re-entry. The presenter will provide a synthesis of research on the re-entry transition, to illustrate the state of our current knowledge, and the
implications for counselling international students. The fourth paper focuses on the transition from university to employment and permanent immigration in the host country. The presenter will describe influences on international students’ career development, including perceived barriers and facilitators in the decision-making process. The symposium brings together five experts who are working in four different countries. The papers together will provide a forum for advancing knowledge about international student transition experiences. The presenters will emphasize the implications for counselling international students and provide suggestions for future research.

Counselling and psychotherapy with international students: What do we know? What do we need to know?

LEONG, F. (Michigan State University)

As international sojourners, many international students in the United States experience a whole range of adjustment problems including culture shock, language problems, isolation and loneliness of living in a strange country for extended periods. The purpose of the current paper is to provide a critical review of the literature related to counseling and psychotherapy with international students from two perspectives: (a) What do we know? (b) What do we need to know? By addressing the first question, guidelines will be suggested about counseling and psychotherapy with international students who are experiencing such psychological problems. A review of the literature on counseling international students will be based on the framework developed by Bergin and Garfield (1994) in their classic Handbook of Psychotherapy and Behavior Change with their four components: the client, the therapist, the process, and the outcome. In using this framework, we will be discussing the client variables with regards to counseling international students, the therapist variables, and we have combined the process and outcome variables into one section since they are highly interrelated. The second question is aimed at identifying potential directions for future research. While there are many important gaps in our knowledge-base on counseling and psychotherapy with international students, for the current paper I will cover only three specific dimensions that I personally think are promising directions and covers different phases of their sojourn: (a) Exploring how Leung and Bond’s program of research on Social Axioms may help us understand the psychological problems experienced by international students in the United States in the early phases of their sojourn since these are the cultural beliefs that they have brought with them, (b) Using Michele Gelfand’s research on situational constraints (i.e., tight vs loose cultures) to understand the adjustment problems of international students in the middle phase of their sojourn, and (c) Applying John Berry’s acculturation model to understanding and helping international students and scholars with their re-entry adjustment upon return home.

Keywords: students, psychotherapy, culture, counselling, beliefs

A relational perspective of international student successes and failures

POPADIUK, N. (Simon Fraser University)

In this study, I examined (a) unsuccessful international students who were required to withdraw from a Canadian university, and (b) successful international student alumni who successfully navigated their Canadian university and post-graduation careers. Given the importance of relational issues highlighted, but not explored in quantitative studies in the field, this in-depth interpretive study attempted to better understand the nature of interpersonal relationships and how they impacted international student transitions. I used Relational-Cultural Theory to underpin this work as a way of conceptualizing how relational connections and disconnections might be implicated in students’ emotional well-being and academic success. Given that only a handful of feminist studies exist in this field, I used the Feminist Biographical Method to explore international student narratives of their difficulties and failure, as well as their strengths and successes. I conducted semi-structured interviews with current university students and alumni who fit the inclusion criteria for the study from a Western Canadian
university. I analyzed the results by using thematic coding and a feminist lens to focus on issues of diversity, power, and privilege (e.g., gender, ethnicity, social class, sexual orientation). Results demonstrated that the nature and quality of interpersonal relationships in the home and host countries strongly influenced international student transition, adjustment, and decision-making post-graduation. When students were able to feel connected to others, when they felt supported and cared for, and when they knew that they were important and mattered to others, they reported being able to face life’s challenges, find a way out of a negative downward spiral, and experience a sense of emotional health and well-being. On the other hand, when students felt disconnected from others in the home and/or host countries, they reported feeling alienated, marginalized, and psychologically vulnerable, which often led to feelings of anxiety and depression. Positive and negative experiences with others influenced international student well-being, which often directly impacted their studies and ability to succeed. Understanding the contextualized and nuanced accounts of international students’ relational connections and disconnections can help counsellors, advisors, and researchers conceptualize transition and adjustment issues from a holistic, meaningful, and in-depth perspective.

Keywords: international students, relational-cultural theory, interpersonal relationships

Counselling international students: Re-entry, re-acculturation, and life re-alignment

LEUNG, A. (The Chinese University of Hong Kong)

This presentation aims to accomplish four objectives. First, theoretical and empirical work related to the re-entrance of international students to their home cultures is reviewed. A number of conceptual perspectives are examined and discussed, including cultural value conflicts perspective, stage perspective, and acculturation perspective. Second, counselling interventions to prepare and facilitate the re-entrance of international students to their home countries are discussed. These intervention strategies would be classified into (a) information (e.g., provide information about re-entry difficulties), (b) psycho-educational (e.g., engage returning international students in a short course to help them learn about re-entry), (c) role model, mentoring and interpersonal support (e.g., help students connect with mentors in home culture), and (d) group and individual counseling (e.g., support group for international students who are planning to return to home culture). Third, core cultural, professional, and individual-identity issues that are salient to the personal and professional development of returning international students are discussed. Fourth, directions for future research and theoretical work on the re-entry of international students to their home cultures are proposed and examined. The literature related to the re-entry of international students to home culture is reviewed. The literature will be organized, synthesized, and presented systematically in this presentation. This presentation is not based on one empirical research study, but results from relevant empirical studies are examined and reviewed. Efforts are made to include literature from diverse locations so that diverse perspectives, voices, and findings are synthesized. Several conclusions are drawn: (a) international students returning home are often confronted with an array of issues, some of them are somewhat unanticipated, including their occurrence and severity. Second, diverse theoretical perspectives allow counsellors and clients to understand the complexity of issues they faced and to identify client’s areas of growth and development, c) counselling intervention as developmental and preventive measures are often helpful to returning students, and (d) the transition is very challenging but many students become more mature in the process and are able to move toward a higher level of functioning personally and professionally.

Keywords: international students, cultural value conflicts, culture, acculturation, counselling

Career planning influences of international students who pursue employment and permanent immigration

ARTHUR, N. (University of Calgary)
There is limited literature on the career development of international students. International students have traditionally been viewed as temporary sojourners who live and learn in another country and then return home. Changing immigration policy in Canada and in several other countries recasts the view of international students as highly desirable human capital and a source of skilled labour. With shifting immigration policies to attract more international students, this study sought to include the perspectives of international students who are completing their studies as temporary immigrants and who are embarking on the career journey of employment and permanent immigration. The intent of the research is to determine key influences on their career decisions, and the types of formal and informal support systems that enhance their success in securing employment and implementing plans for permanent immigration to Canada. This research project examined the career planning experiences of international students at one university in Western Canada who are making the transition from school to full-time employment in Canada. The main question that was explored through this research follows: What are the key influences that international students perceive to be facilitators or barriers to pursuing employment and permanent immigration to Canada? To pilot this research, an on-line survey was developed to focus on key influences and to test this medium as a way of collecting critical incidents from international students regarding their career transition experiences. In-depth interviews were also conducted with individual international students to gain more details regarding the influences on their career planning and decision-making. The results from this study suggest that the career development needs of international students are integrally related to cultural influences from their home countries but also to the perceived barriers and opportunities in the host country. Influences on their career decision-making often pose strong challenges for students in reconciling perceived conflicts of values, relationships, and employment opportunities. Although many international students wish to remain in the host country, their decisions are confounded by cultural influences that often lead to a complex and difficult process for students. Changing immigration policy requires a corresponding shift in policies pertaining to institutional programs and services in higher education, and in institutional linkages with employers. Comprehensive career counselling approaches are required to addressing the career development needs of international students, including the option to work and live in the host country following graduation. Implications for counselling and future research will be summarized.

Counselling psychology: Voices across the Pacific

Chair(s): DENHAM, G. (La Trobe University)

Counseling psychology is a specialist scope of practice in Australia and across the globe. However, like any specialty, counseling psychology takes on particular forms and appearances in different locations, and what binds us together and what marks us out as being different is part of an ongoing dialogue. This symposium compares and contrasts the contemporary practice of counseling psychology in three countries straddling the Pacific Ocean, Australia, New Zealand and the US. That distinctive forms of our practice occur in different locations says something about our commitment to dialogue and relationship and our refusal to adopt a ‘one size fits all approach’, among other things. The papers in this symposium examine the recent activities and professional identities of those engaged in counseling psychology in the US, New Zealand and Australia, and looks for confluences in the streams and currents in counseling psychology in these regions. Learning Objectives include: Introduce contemporary counseling psychology teaching practice in three countries, the US, Australia and Aotearoa, NZ.

Counseling Psychology in the United States: Challenges for a mature sub-discipline

HEPPNER, P. (University of Missouri)

The aim of this presentation is two-fold: (a) to briefly describe the maturation of counseling psychology in the United States, and (b) to discuss past and most importantly current challenges that have affected our development. The presentation will be informed by the author’s thirty years within Counseling Psychology as a: researcher, educator, editor (The Counseling Psychologist), and president (Society of Counseling Psychology), professional writing (chapters and books) on the history of United States Counseling Psychology, and Series Editor of Lifelines which documented the oral history of many pioneers in counseling psychology. Many events have transpired within and outside of counseling psychology over the last 100 years, and the profession has changed in many ways, in some cases profoundly. The maturation of counseling psychology in the United States will be visually depicted from 1909-2010, highlighting major event and defining moments. The profession has not progressed in a vacuum, but rather through a range of social (e.g., Women’s Rights Movement), cultural (e.g., multicultural and social justice issue), economic (e.g., the great depression), governmental policies (e.g., national defense), global forces (e.g., the shrinking of time and space), as well as national (e.g., training standards) and global professional issues (e.g., cross cultural collaboration) have shaped our profession. All historical analyses of the counseling psychology profession have revealed numerous challenges, both within the profession as well as external social forces. The presentation will discuss twelve critical challenges across four major domains: (a) within our professional associations, such as maintaining unity within a broad and varied discipline, (b) maintaining an active research and social policy agenda that addresses major societal needs, (c) integrating cultural diversity throughout our research, training and practice, and (d) developing culturally sensitive and meaningful international collaboration with the increasing shrinking of time and space. Although “we have come a long way baby”, it will be concluded we have much further to go to reach our ever changing goals as the world changes rapidly around us.

Keywords: counselling psychology, United States, cultural diversity, professional issues, training

Counselling psychology in Australia: Present and future.

DENHAM, G. (La Trobe University)

The aim of the current study was to introduce the work in counseling psychology in Australia. In providing psychological therapy in Australia counseling psychologists have focused on the compelling empirical evidence that the therapeutic alliance predicts a much larger part
of the outcome variance than specific models or techniques of therapy. Using a range of informing models including cognitive behavioural, psychodynamic, process-oriented, family systems - to name a few, counseling psychologists in Australia have recognised the contributions made by clients to their own well-being as critical aspects of therapeutic work, and have not strayed from acknowledging the collaboration required in effective this work. A person or patient-centric focus has remained a key element in this approach, addressing the problems that a diverse range of clients present across the lifespan. In reviewing the research conducted by Australian counselling psychologists in the last ten years, the expression of the basic features of counselling psychology in this country are illustrated: challenges to the notion of the ‘passive client’ of psychotherapy; the importance of making the therapist visible; a process and integrationist orientation to psychotherapeutic work; a critique of the intra-psychic deficits idea; a recognition of the importance of not making the client’s distress worse.

Keywords: counselling psychology, Australia, well-being

Counselling psychology in Aotearoa, New Zealand?

RODGERS, N. (University of Canterbury)

The aim of the current study was to introduce the contribution of counseling psychologists in New Zealand and the recent attempts to establish a scope of practice for counseling psychology. Examined here is the contribution of counselling psychology in New Zealand. There is no scope of practice for counselling psychology in Aotearoa at the present time, and the impact of the specialty relies on the teaching and professional work of ‘imports’ from overseas, in the form of counselling psychologists from Australia, South Africa, and the UK. The recent history of attempts to establish a counselling psychology scope of practice in New Zealand are outlined, and the impact of counselling psychology in New Zealand is described.
Creation and experiences of family by lesbian women, gay men, and bisexual people

Chair(s): RIGGS, D. (Flinders University)

This symposium features cutting-edge research on the creation and experiences of family by lesbian women, gay men, and bisexual people. Focusing on such diverse topics as foster care provision by lesbian women and gay men and the experiences of family of young bisexual people, and presenting findings from large studies on the lives of Australian lesbian and gay parents, this symposium represents an important opportunity for psychologists to better understand the specific needs and strengths of these populations. The findings presented in the symposium will contribute significantly to the current body of knowledge on lesbian- and gay-parented families, and will usefully extend this by introducing a further focus on the experiences of non-heterosexual youth and those young people in multiparent families. Participants can expect, through attending the symposium, to come away with a clear understanding of 1) some of the common routes to family formation used by lesbian and bisexual women, 2) the ways in which lesbian and gay parents negotiate the work/life balance within their families, and 3) how bisexual young people and those in multiparent families negotiate their families. This information will be highly useful for practitioners working with non-heterosexual families, both by recognizing the challenges that they face living in a heteronormative society, and the resistances and resiliences they display in the face of this.

Experiences of Australian lesbian and gay foster carers and those who work with them

RIGGS, D. (Flinders University)

While a growing number of Australian foster care agencies actively recruit lesbians and gay men as potential foster carers, few agencies have guidelines for working with this population. Similarly, whilst there is a growing body of research on the experiences of Australian lesbian and gay parents, little of this research has focused on the experiences of lesbian and gay foster parents. The research project reported here sought to address these two shortfalls in existing research and practice by exploring the support needs and experiences of lesbian and gay foster carers and those who work with them. Interviews and focus groups were conducted with lesbian and gay foster carers and the agency workers who support them across four Australian states. A survey was also designed for each group (workers and carers) to elicit both basic demographic information and opinions on a range of topics related to support and care provision. Survey data were analysed using non-parametric methods to ascertain differences between the two groups and also differences within the groups across states. Interview and focus group data were analysed using thematic analysis. Findings suggest that support experienced by lesbian and gay carers was largely restricted to the ‘luck’ of having a good worker. Some carers felt adequately supported by foster care agencies whilst others found the foster care system in general to be antagonistic and homophobic. Agency workers reported overall a relative lack of information or training in working with lesbian and gay carers. Awareness of existing guidelines or policies amongst both carers and workers was patchy, and the utility of the guidelines for increasing support for both groups was considered limited. Whilst guidelines are essential for providing a policy framework for working with lesbian and gay foster carers which protects their wellbeing, agencies need to go beyond the production of guidelines so as to 1) challenge heteronormativity, 2) move beyond a liberal inclusive model, and 3) recognize the broader social contexts in which both carers and agency workers operate, which function to constrain the lives of lesbian and gay carers and the children in their care.

Keywords: foster carers, lesbian, gay, guidelines

Gay and lesbian parents ‘do work/family balance’
BROWN, R. (Deakin University)

This research aimed to critically examine same-sex parents’ egalitarian ethic and practices underpinning the arrangements they make in balancing work and childcare commitments, and to better understand actual and ideal choices underlying work and family arrangements. A population of 460 Australian and New Zealand same-sex parents, including those who identified as gay male (n = 66) and lesbian (n = 341) parents responded to a self-report questionnaire administered in an online (electronic) format. The survey contained over 100 items, some with Likert scales and some open-ended questions that required thematic coding. The findings presented here are based on 419 participants’ responses to open-ended questions asking: Can you describe the way in which you organise paid work and childcare commitments in your family?; Can you describe the reasons why your family organises work and childcare commitments in this way?; and What would be the ideal situation for you regarding the organisation of work and childcare commitments in your family? Around half of all reasons offered were directly related to the desire to maximise time with children. One in four reasons cited were pragmatic grounds such as financial need, earning potential and availability of government pensions for choices behind which parent worked longer hours in paid labour and who would devote more time to childcare. Only 15% of reasons included the intrinsic value and pleasure in work as a reason underpinning arrangements. The major motivation underlying work/family arrangements lay not solely in egalitarianism per se, but relied on a depth of ingenuity around making arrangements that enhanced — for each parent if they were in partnership, and for sole parents too — their opportunities to spend time with their children. A desire to each maximise time with their children was the significant motivator and the significant ideal behind these parents’ attempts to achieve work/family balance in their daily lives. It was noteworthy too that one-third of all same-sex parents in the study reported that the balance they had created between work and family was actually already ideal.

Keywords: same-sex parents, lesbian, gay, work-life balance

Border sexualities, border families

PALLOTTA-CHIAROLLI, M. (Deakin University)

School policies, curricula and student/family welfare systems, particularly in relation to health and sexuality education, are increasingly affirming and supporting gay and lesbian students, and gay and lesbian families. Yet despite this, there appears to be minimal acknowledgment and few social and mental health strategies which call for sexual and family diversity to be recognised in relation to students and families beyond and on the borders between the gay/straight divide, and beyond and on the borders of the monogamous heterosexual or homosexual couple framework. Framed by queer, social deconstructionist, post-colonial and feminist theories of gender, sexuality, health, and education, this paper reports qualitative research conducted between 2000 and 2007 in Australia and the United States with 100 individuals who identified as bisexual students or as members of multisexual, polyamorous or multipartnered families. Findings suggest that these groups employ three main strategies in order to manage their location ‘at the borders’: 1) passing or normalization and assimilation in school settings; 2) bordering or negotiation and navigation between the private world of home and public world of school; and 3) polluting or non-compliance and resistance, thereby outing their sexualities and families within the school world. Recommendations for policies, pedagogy and pastoral care are discussed as well as presenting the strategies these ‘border sexualities’ and ‘border families’ use in order to minimize discrimination and harassment.

Keywords: border sexualities, border families

Conceiving the family: Australian lesbian women’s accounts of conception decisions in relation to known and unknown sperm providers, and of relationships (or lack thereof) with these men

SHORT, L. (Victoria University)
Decisions related to the type of sperm provider (known or unknown), and the types of relationships that lesbian women and their children have with sperm providers vary. The aim of this research was to analyse aspects of the family life of lesbian women in Australia, including how the varying legal, public policy, social and discursive contexts affect and shape conception decisions, and subsequent relationships and experiences with sperm providers. The research aimed to analyse the effects of the recent significant legal changes in Australia to recognise both women in a female couple as legal parents of children conceived via assisted reproduction. Sixty-eight participants from three States and Territories of Australia were interviewed (56 lesbian mothers or intending mothers and 12 service providers or community organisers). The data were analysed using a contemporary grounded theory approach, and contextualised with analysis of legal, public policy and other documents. It was found that decisions about, and experiences of, conceiving with the assistance of sperm from a known or unknown donor, and subsequent family life, are shaped by the varying levels of legal recognition accorded to same-sex couples as parents and of access to assisted reproduction services across Australia, and the understandings and discourses about families, genetic relatedness, fatherhood, and the best interests of children that are in circulation. Considering the findings in the context of related Australian and international research further illuminated the ways in which these decisions, relationships and experiences vary across time and place, in relation to the legal, public policy, social and discursive context. A range of strategies are reported to be used by lesbian women to plan and navigate family life in relation to sperm providers, and both positive and negative experiences are common. The findings provide important information for psychologists and others who work with members of lesbian-parented families, as well as for public policy makers and legislators. It contributes to our knowledge about the diversity of family life in contemporary Australia and elsewhere, in particular in relation to the significant legislative changes to parentage that are now being made in a range of countries.

**Keywords:** lesbian-parented families, sperm providers
Cross cultural studies of children’s temperament

Chair(s): DINCA, M. (Titu Maiorescu University Bucharest)
Discussant(s): OAKLAND, T. (University of Florida)

The purpose of this symposium is to discuss the results and implications of three cross-cultural studies that examine the development of children’s temperament. All studies used a common instrument, Student Style Questionnaire, which is based on Jung’s theory enhanced by Myers and Briggs that includes four bipolar qualities: extroversion-introversion, practical-imaginative, thinking-feeling, and organized-flexible. This symposium is the first to bring together in one forum, four research teams from Australia, South Korea, Romania, and Zimbabwe together with the author of the Student Styles Questionnaire to discuss this research. This symposium will discuss the results of studies of the development of temperament among similar age children, discuss the implication of these data in light of children’s learning styles, and examine the feasibility of acquiring similar data using Rasch and Differential Item Functioning (DIF) methods.

The study designs for the acquisition of these data are the same. Temperament data were acquired for 75 to 100 children at each of the following four age groups: 9-11, 12-13, 14-15, and 16-17 years; 50% were boys. Data from a comparable study of children in the United States were used as a comparison group. Children’s temperament preferences from the four countries display considerable similarities as well as some difference. Australian children generally prefer extroversion to introversion styles, imaginative to practical styles, thinking to feeling styles, and organized to flexible styles. South Korean children generally express preferences for extroverted, imaginative, feeling, and flexible styles. Romanian children generally express preferences for extroverted, practical, thinking, and organized styles. Zimbabwe children generally prefer extroverted, practical, feeling, and organized style. Females generally prefer feeling styles while males generally prefer thinking styles. Construct validation results will be discussed along with the merits of using Rasch modeling methods.

Utilising insights from research and professional practice on the Student Styles Questionnaire (SSQ) in Australia

FAULKNER, M. (La Trobe University)

Temperament qualities are often overlooked as significant influences in family and classroom life, and, in the contribution temperament can make to student learning style diversity. Teachers, parents, and school psychologists need to be more aware of temperament quality variations, and learn how to be more enabling with any student irrespective of his / her individual temperament qualities. The aim of the study was to discuss the temperament development of Australian children and youth and to discuss possible implications of the data in reference to their learning styles and other behavioral Individual case examples drawn from a study of gifted children in regional Australia also will be summarized. Data from more than 300 children and adolescents were gathered using the Student Styles Questionnaire (SSQ), with approximately equal numbers of males and females. The presentation will selectively draw on the following Australian sources: (i) Regional Australian data collected on the SSQ (N = 308) in 1999-2000; (ii) Individual case examples drawn from a study of gifted children in regional Australia in 2003-2004 (N = 33); (iii) Individual case examples drawn from the presenter’s psychology practice; and (iv) Use of the SSQ with a year 8 classroom group (2007). The presentation will include discussion of data obtained from research and case illustrations from both research and professional practice. In general, children from Australia prefer extroversion to introversion styles, intuitive to practical styles, thinking to feeling styles, and organized to flexible styles. As expected gender differences exist on thinking-feeling and organized-flexible styles. The SSQ, for which there is a growing research base internationally, offers good diagnostic insights as part of the psycho-educational assessments of Australian children and adolescents with respect to seeking to achieve
a better interface between an individual student and his/her school program.

Keywords: temperament, children, Student Style Questionnaire, psycho-educational assessments, learning strategies

Temperament styles of children in South Korea and the United States

LEE, D. H. (Pusan National University), OAKLAND, T. (University of Florida)

The purpose of this proposal is to describe temperament style preferences of South Korean children and to explore possible gender and age differences among them. The current study also compares the temperament preference of children from South Korea and the US. Some scholars believe temperament and personality must be understood in light of local culture (Triandis, 2002) while others believe personality is largely independent of cultures (McCrae & Costa, 1997). This research on South Korean children's temperament will add to this literature and may help resolve this difference in opinions. Temperament styles of 4,628 South Korean children, ages 9-17 years, are compared with those of 3,200 U.S. age peers in the light of Jung’s theory of temperament as modified by Myers and Briggs. The SSQ is a self-report measure. It was found that South Korean children strongly prefer extroverted to introverted, imaginative to practical, feeling to thinking, and flexible to organized styles. In contrast to South Korean males, South Korean females are more likely to prefer extroverted, feeling, and organized styles. Age differences are seen on all four styles, with children generally expressing a greater preference for introverted, practical, feeling, and flexible styles with age. In contrast to U.S. children, South Korean children are more likely to express preferences for extroverted, imaginative, feeling, and flexible styles. These preferences also are more frequent in South Korean than U.S. males and females as well as all four age groups. Our findings regarding South Korean children are generally consistent with previous literature (Bassett & Oakland, 2009; Myers, McCaulley, Quenk, & Hammer, 1998). South Korean children were more likely to prefer introverted, practical, feeling, and flexible styles as they became older. The cross-cultural findings are unexpected in light of presumed cultural differences between Korea and the U.S. (Jung & Stinnett, 2005), results from previous studies of temperament among South Korean and U.S. adults (Hammer & Mitchell, 1996).

Keywords: temperament, children, personality, culture, South Korea

Validating predictions for children’s temperament styles

ILIESCU, D. (SNSPA University), DINCA, M. (Titu Maiorescu University)

The Student Styles Questionnaire (SSQ) (Oakland, Horton, & Glutting, 1996) is based on Jung’s theory of personality types and as such bases predictions mainly on theoretical assumptions which sound logical and convincing but have up to date received little attention in terms of validation. For example, when speaking about pitfalls in the classroom, is it really more possible for Extraverts to distract other students in the classroom, or for Organized students to be anxious or to become frustrated when their schedule is being changed? A total number of 627 students (44% males) aged 14 to 18 years ($M = 16.1$, $SD = 1.3$) completed the SSQ. A teacher (usually the regular class supervisor) completed for every child a list of 83 behaviors, evaluating on a 5-point scale the probability for the respective child to engage in that specific behavior. The behavior list is compiled from predictions suggested in the SSQ Technical Manual as being typical for every one of the 8 concepts (the poles of the 4 bipolar scales) measured by the SSQ. Correlations and factor analyses show a picture of great coherence for the predictions suggested for Extraversion and Introversion, good confirmation for Flexible-Organized and a somewhat not so strong confirmation for Practical-Imaginative and Rational-Emotional. Multi-dimensional scaling suggests also other interactions between the concepts measured.
and the list of classroom behaviors. The data appear to support most of the descriptions and suggestions which are recommended based on the scores of the SSQ, adding important validation information and empirical support to some of the theory-driven assumptions Jung-type temperament measures are usually based upon.

Constructing interval scale temperament style measures

MPOFU, E. (University of Sydney), OAKLAND, T. (University of Florida), MHAKA, M. (Schools Psychological Services), GWIRAYI, P. (Midlands State University)

The structure of temperament styles was investigated using Rasch and Differential Item Functioning (DIF) methods with data from 397 (46% males) early adolescents. The students completed the Student Styles Questionnaire (SSQ) (Oakland, Horton, & Glutting, 1996), a 69 item children’s self-report measure of temperament styles that uses a forced choice item format. Each item was scored as a dichotomous Rasch scale variable. Principal component analysis of the standardized residuals yielded unidimensional latent temperament variables for extroversion-introversion (EI), practical-Imaginative (PM), thinking-feeling (TF), and organized-flexible (OL) styles. Higher endorsements were found for extraversion (E) than introversion (I) styles, for practical (P) than imaginative (M) styles, for feeling (F) than thinking (T) styles, and for organized (O) than flexible (L) styles. TF style indicators seemingly were targeted more appropriately to the Zimbabwean adolescents than were EI, OL, and PM styles. Rasch modeling methods appears to have merit when constructing and using interval scale measures of temperament styles from forced choice data.

Keywords: temperament, adolescents, Student Styles Questionnaire, Rasch modeling, extroversion-introversion

Cultural competence: Working with Australian Aboriginal and Torres Strait Islander People

Chair(s): DUDGEON, P. (University of Western Australia)

Discussant(s): GRIDLEY, H. (The Australian Psychological Society)

This symposium overviews the current developments, programs and issues in developing a culturally competent profession in Australian psychology. International and Australian studies have shown relationship between social disadvantage and health, including mental health. In order to improve health and wellbeing, social disadvantage and its effects, particularly among the disenfranchised needs to also be addressed. There have been widespread calls for new approaches to Indigenous mental health that identify and acknowledge the distinctive circumstances of Indigenous Australians — the resilience of Indigenous cultures; the collective experience of racism, and the disempowerment of colonisation and it’s legacy Traditional mainstream mental health approaches have failed Indigenous people and interventions have little understanding of their realities. Genuinely transformative approaches require Culture Competence across systems, organisations, professions and individuals. There is an urgent need for mainstream service providers who work with Indigenous people to offer services in more culturally secure and appropriate ways. This has become an important issue for psychologists working with Aboriginal and Torres Strait Islander peoples. The National Practice Standards for the Mental Health Workforce require all Australian psychologists to demonstrate an understanding of culturally appropriate assessment instruments and techniques and the way cultural issues can impact on the appropriateness of their assessment and treatment of Aboriginal and Torres Strait Islander people. As well as understanding and respecting Aboriginal and Torres Strait Islander definitions and concepts of
emotional health and wellbeing and the impact of social, cultural and linguistic factors on mental health, psychologists are expected to use language and communication styles that are culturally and linguistically sensitive and to regularly evaluate their practice in relation to cultural appropriateness in Indigenous settings. This symposium addresses cultural competence in the discipline of psychology. Presentations overview how the professional body is providing cultural competence training to practicing psychologists, examine the key dimensions of cultural competence using case studies from curriculum-based and applied research, discuss why cultural competence needs to be positioned from a space that recognizes the continuing effects of colonization; cultural difference and power. The issues and challenges that Aboriginal and Torres Strait Islander psychologists confront in the profession are also addressed.

Cultural competence workshop developed by the Australian Indigenous Psychologists Association

The National Practice Standards for the Mental Health Workforce require all Australian psychologists to demonstrate an understanding of culturally appropriate assessment instruments and techniques and the way cultural issues can impact on the appropriateness of their assessment and treatment of Aboriginal and Torres Strait Islander people. One of the goals of the newly formed Australian Indigenous Psychologists Association (AIPA) is to lead the change required to deliver equitable, accessible, sustainable, timely and culturally safe psychological care to Aboriginal and Torres Strait Islander peoples in urban, regional and remote Australia. To further this goal AIPA has developed a Cultural Competence workshop using the framework provided by the National Standards for the Mental Health Workforce. The workshop is not a general cultural awareness course. Rather, it is a specialised training designed to provide psychologists with the skills, knowledge and attitudes they need to deliver effective and culturally competent care to Aboriginal and Torres Strait Islander people. We aim to assist psychologists to comprehend key cultural values and also to recognise the limits of their knowledge and competence. Targeting our training to meet the Aboriginal and Torres Strait Islander specific components of the National Standards for the Mental Health Workforce will not only strengthen the overall competency of non-Indigenous psychologists but will improve the accessibility and quality of care provided at every phase of the social and emotional wellbeing and mental health care continuum for Indigenous Australians, which in turn can be expected to contribute to closing the gap in mental health outcomes between Indigenous and non-Indigenous Australians. However, at the same time we recognise that on its own, culturally competent psychological care cannot—and should not be expected to—eliminate all social and emotional wellbeing and mental health disparities. To achieve this, we also need to address the key social determinants (including socioeconomic status, discrimination, employment, education and housing) that contribute to Indigenous disadvantage and psychological distress. This presentation will provide an overview of the workshops undertaken and highlight the main issues and needs arising from the project.

Keywords: Australian psychologists, Australian Indigenous Psychologists Association, mental health, well-being, discrimination

Extending cultural competence through critical praxis: What does that really mean?

WALKER, R. (Telethon Institute of Child Health Research), SONN, C. (Victoria University)

Cultural competence (CP) has been promoted as key concept for addressing health inequalities in Australia and other countries. In this presentation we overview some key dimensions of cultural competence, but warn that CP can’t be an idealized end state. Using case studies, we argue that developments in critical social science can extend the notion to avoid unintended colonialisms. Central to social science work writing is the notion of power and the need to be attuned to power in
working across cultural boundaries – that is reflexivity. We draw on ethnographic data taken from case studies of curriculum-based research and applied research that aimed to promote cultural awareness and education for anti-racism. Based on these case studies we offer a framework for promoting CP that is illustrated with case data. Using the case studies we argue that cultural competence can be extended and enhanced through critical praxis. This is often a difficult and emotional process, but vital for disrupting dominant theories held about mental health, which can often result in victim blaming and other negative outcomes for Indigenous clients, families and communities. We argue that the relations between the disciplines and professions, and between those professions and Indigenous people, are part of the context that has given rise to new ways of working in ways that are empowering, respectful and ethical. In our view, cultural competency is a dynamic that is contingent and all about ensuring sensitive, just and transformative practice.

Keywords: cultural competence, Australia, power, reflexivity, critical praxis

Institutional racism within allied health practices: An Indigenous perspective.

SCHULTZ, C. (Australian Indigenous Psychologists Association)

Examining the institutionalised racism in Australian professional health and mental health practice, particularly psychological services, may be a confronting topic. However I suggest that this form of racism not only exists within our profession but that it also impacts on Indigenous Australians pursuing or continuing their careers in the field of psychology. There is an increasing demand for practitioners to become culturally competent. This has resulted from recognition that traditional western mainstream public health approaches have failed Indigenous people due to interventions having no relationship or understanding of Indigenous people’s realities. As well as increasing the cultural competence of non-Indigenous psychologists, an important goal is to increase the number of Indigenous psychologists. Indigenous psychologists themselves need to be supported and encouraged to develop culturally appropriate interventions, programs and services. This presentation will outline the challenges and issues that Indigenous psychologists confront in creating spaces that enable culturally appropriate service delivery. Stokely Carmichael coined the phrase ‘Institutional racism’ to explain ‘the collective failure of an organization to provide an appropriate and professional service to people because of their colour, culture, or ethnic origin’. Covert racist practices within an organisation not only impact on the organisation’s clientele but on its own employees. Indigenous employees within mental health services too often report not receiving ‘an appropriate and professional service’ from their employers. It is important for managers of such services to be culturally competent and sensitive, to ensure that Institutional racism experienced by our Aboriginal and Torres Strait Islander mental health professionals, such as psychologists, mental health workers, mental health nurses and social workers, is minimised. By limiting this form of racism in the workplace, and thus creating culturally safe and empowering spaces, we may increase the number of practicing Indigenous mental health professionals. In turn, this will increase the likelihood that Aboriginal and Torres Strait Island community members have the opportunity to access Indigenous-facilitated, focused and culturally appropriate assistance.

Developing cultural competence across the health sector in Western Australia

WALKER, R. (Telethon Institute of Child Health Research), DUDGEON, P. (University of Western Australia)

Research was undertaken to identify and develop appropriate cultural competence assessment tools, resources and strategies to progress maternal and infant outcomes for Aboriginal women and their families. This was done by improving communication and decision-making protocols and practices in relevant health sectors. Reviews were
undertaken about definitions of cultural competence and related concepts; existing assessment tools—their construct validity, reliability and effectiveness; and, relevant national and state policy and action frameworks. Cultural Competence assessment tools were adapted and developed in consultation with relevant stakeholders. This would ensure cultural responsive antenatal services to enhance maternal and perinatal outcomes for Aboriginal women and their babies. Two hospitals trialled the assessment tools and examined mechanisms and processes to integrate Cultural Competence into their organisational continuous improvement and professional development practice.

Comprehensive qualitative interviews were held with hospital staff, Aboriginal Medical Services’ practitioners and Aboriginal families further confirmed that both staff and families believe that poor communication and cultural misunderstandings impact negatively on outcomes and decisions and the overall emotional wellbeing of Aboriginal women and their families when faced with critical care needs—highlighting the need for cultural competence at all system levels. There are four dimensions of cultural competence—system, organisational, professional and individual. These dimensions interrelate so that cultural competence at an individual and organisational level is driven and motivated by systemic and organisational commitment and capacity. Integrating cultural competence into the organisation and workforce can improvements in the care and outcomes for Aboriginal families.

**Cultural diversity in organisations: Towards informed HR practices of recruitment and climate**

Chair(s): VAN DE VIJVER, F. (University of Tilburg; North-West University), SANDAL, G. (University of Bergen)

Globalization and changing demographic patterns are making it more important for leaders to understand how to influence and manage workers with different values, beliefs, and expectations. Cultural diversity offers both potential benefits and costs for organizations. On the positive side, a greater variety of perspectives increases creativity and full utilization of a diverse workforce will increase the amount of available talents for filling important jobs. However, diversity can also result in more distrust and conflicts, lower satisfaction and higher turnover. The presentations in this symposium focus on these topics. What are the determinants of employees’ trust in multicultural organizations? How do companies’ approaches to managing diversity influence satisfaction and feelings of inclusiveness and belonging of minority employees? How can cultural differences in self presentation tactics among job applicants impact on the efficiency of personnel recruitment? The answers to these questions may have important implications for human resource management. The key learning objective of the symposium is to provide a better understanding of the processes that influence the outcomes of diversity at the workplace, and ethnic bias in personnel recruitment.

**Personality characteristics and expressions of social trust. A survey among minority and majority members**

VAN OUDENHOVEN, J. (University of Groningen)
The workplace is a major factor for integrating first and second generation immigrants and majority members. Individual factors may play an important role in creating trust at several levels, which enhances integration in organizations. The influence of a selection of key personality factors on indicators of trust is examined. Distinctions are made between employees of the majority group, and first generation and second generation minority groups. A Group of over 500 employees from three different groups (majority and first and second generation minority groups) filled out a questionnaire. Key personality characteristics are: secure attachment, self-esteem, and multicultural personality dimensions (Open-mindedness, cultural empathy, flexibility, social initiative, and emotional stability). In addition a new instrument to measure tacit knowledge has been developed. Dependent variables are: trust in coworkers, trust in leaders, trust in organizations, trust in society, and identification with the organization, work satisfaction, and feelings of exclusion. Comparisons between groups of employees are made via MANOVA’s. In addition, multiple regression analyses within each group will establish the variance in trust measures explained by the personality measures and some demographics (gender, age and educational level). In general personality characteristics explain a considerable amount of variance in trust measures. So does educational level. Both minority groups members do not differ from majority members in their level of organization trust, but they do have lower level of trust in the society. Interestingly, second generation minority members have as much trust in their coworkers and leaders, are equally satisfied with their work, identify to the same degree with their organization, and feel equally included as majority group members. First generation minority employees, however, show lower scores on these indicators of trust. Important predictors of trust are a secure attachment, a high self-esteem and cultural empathy. Intercultural competencies are important, but, interestingly, it depends on the type of group how much variance they explain. They explain most variance in the first generation minority groups who experience most intercultural stress on a daily basis. The tacit knowledge measure shows a large difference in perceptions of power distance: minority members are much more preoccupied about their relation with their supervisor, and are more anxious to show respect to them. The study shows a considerable impact of personality on general levels of trust of employees. Intercultural competencies are important, but their impact varies across groups. They are more important for newcomers who are more exposed to cultural differences.

Keywords: integration, social trust, personality factors, minority groups, attachment

Diversity in (organizational) perspective: The impact of company policy and climate on the outcomes of cultural diversity at work

VAN DER ZEE, K. (University of Groningen)

Cultural diversity at the workplace is on the increase, which is not a matter of course, as companies still are reluctant to hire minority employees. Moreover, their turnover is high. In general, minority employees feel best if they are able to identify with their organization and maintain aspects of their original culture at the same time (e.g. Van der Zee, Atsma, & Brodbeck, 2004). Based on a human need to belong, they like to be part of their organisation and team; based on a need to be unique, they wish to bring in their original culture and be recognised for that (Brewer, 1991). However, in their policies, organizations tend to put strong pressure on cultural minorities to assimilate to the dominant culture. Negative outcomes of diversity often seem to result from this mismatch of the needs of the organisation and those of cultural minority members (Bourish, Moise, Perreault, & Senecal, 1997). In the present paper data will be presented that suggest that this mismatch may be resolved when organizations manage to adopt more colourful approaches towards diversity. Many current organizations are highly concerned not to discriminate between categories of employees and monitor and adjust their policies to ensure that this is the case. They adopt a colour-blind approach, stressing similarities and disregarding the relevance of cultural identities. Such an
approach fosters pressure towards assimilation. Feelings of belongingness and recognition are better served by more colourful approaches to diversity that focus on the value of diversity for example as a means to gain access to a diverse market or as a resource that provides strategic advantage to the company. Relying on the theoretical framework of Ely and Thomas (2001), data from a variety of companies will be presented showing that colourful approaches towards diversity are indeed associated with more positive organizational outcomes amidst diversity. Moreover, colourful diversity approaches stimulate an organizational climate that radiates acceptance and appreciation of diversity. Such an open climate is associated with higher work satisfaction and feelings of acknowledgment among minority employees. The implications of these findings for HRM-practice are discussed.

Intended self-presentation tactics in job interviews: A 10-country study

VAN DE VIJVER, F. (University of Tilburg, The Netherlands and North-West University, South Africa)

Impression management may be understood as a conscious or unconscious attempt to control the images that are conveyed in communication. It is often associated with dissimulation, including deceiving others, faking, and lying. During job interviews, self-promotion can entail entitlements (claims of responsibility for positive events), enhancements (claims that the event for which one is responsible is more positive than it is), and descriptions of how obstacles were overcome. Defensive tactics focus on repairing one’s image when it has been damaged by offering excuses, apologies, or justifications. We were interested in cross-cultural differences and similarities in self-presentation tactics. Self-presentation strategies in job interviews were examined among university students in 10 countries (Germany, Ghana, Hong Kong, Iran, Italy, Malaysia, Norway, Russia, Turkey, and the U.S.A; total N = 3,509). The Cultural Impression Management Scale was administered, which measures self-presentation strategies in job-oriented domains (Emphasizing Organizational Competencies and Emphasizing Individual Achievements) and relationship-oriented domains (Pointing out Obstacles and Self-Effacement). All subscales showed structural equivalence. Cross-cultural differences were larger for relationship-oriented tactics than for job-oriented tactics. Samples from less affluent and more hierarchical countries showed higher scores on all scales than samples from more affluent and less hierarchical countries, with the exception of the American sample that showed relatively high scores on all subscales. The latter is interpreted in terms of the relatively large importance attached in American culture to “selling oneself” in job interviews, whereas in countries with comparable levels of affluence, authenticity and humility are relatively more valued. Analysis of differential item functioning identified culture-specific norms regarding communication conventions such as maintaining eye contact and a proactive attitude during the interview. Results regarding these country profiles will be presented. The use of self-presentation tactics in job interviews is presumably universal; however, this universality is combined with relatively large and meaningfully patterned cross-cultural differences in mean scores. Students from less affluent countries (which typically have higher unemployment rates than more affluent countries and where jobs may be more difficult to attain) are more likely to display self-presentation tactics, notably relationship-oriented tactics.

Keywords: self-presentation, job interviews, communication, defensive tactics, cross-cultural differences

Making a favourable impression during job interviews: Immigrants and ‘mainstreamers’ self-presentation tactics

SANDAL, G. (University of Bergen)

Non-Western immigrants in Norway have an unemployment rate far above the native population and immigrants from other Western countries. One possible contributing factor is the widespread use of interviews in
hiring processes which might be biased against these groups. This study examines whether there are ethnic differences in what people evaluate to be a favourable self-presentation during job interviews. Native-born Norwegians and immigrants to Norway from four different ethnographic regions (Horn of Africa, South-East Asia, Middle-East, and Sub-Indian Continent) \((N = 1200)\) were compared. Also, the intended self-presentation of immigrants were compared with the judgments of Norwegian managers \((n = 436)\) concerning how to make a favorable impression during job interviews. The Cultural Impression Management scale (CIM) was administered. CIM measures three self-presentation tactics: ‘Emphasizing organizational competencies’, ‘Pointing out obstacles’, and ‘Emphasizing individual excellence’. The immigrant groups indicated more use of self-presentation tactics than the native Norwegians. ‘Pointing out Obstacles’ showed the largest difference. The magnitude of difference between immigrants and the native population was influenced by the immigrants’ employment status, number of years living in Norway, length of education, and preferred acculturation strategies. Immigrants from less affluent and more hierarchical countries of origin intended to use most self-presentation tactics. While there were variations between immigrants from different countries of origin, a general tendency was that they emphasize organizational competencies less than what the Norwegian managers considered to be favourable. The results demonstrate ethnic differences in how job applicants present themselves during job interviews, and suggest that such variation may have implications for hiring decisions that could easily disfavor candidates with a minority background.

**Current issues in diagnosis focused on the revision of ICD-10**

Chair(s): RITCHIE, P. L. J. (University of Ottawa)

The World Health Organization (WHO) is currently developing ICD-11, scheduled for approval in 2014. The ICD is the international standard for assessment and monitoring of mortality, morbidity, and other health parameters. It exerts enormous international influence on clinical care, public health, health care education, research activity, health care administration, and health care policy. The technical work of developing the classification of mental and behavioural disorders is being led by WHO’s Department of Mental Health and Substance Abuse, and is for the first time in history being directed by a psychologist. Dr. Pierre Ritchie, symposium chair, will provide a historical account of the work with WHO on the part of organized psychology that has led to this unprecedented opportunity. Dr. Geoffrey M. Reed, WHO Senior Project Officer for the mental and behavioural disorders revision, will provide an overview of WHO perspective and work program related to the revision, and their potential implications for global psychologists. The Department is assisted in the task by an international Advisory Group, which includes several psychologists, including an official representative of the International Union of Psychological Science (IUPsyS). Dr. Ann D. Watts, IUPsyS’s representative to WHO’s Advisory Group, will discuss opportunities for involvement by psychologists and national psychological associations in the ICD revision process. One of WHO’s key strategies for the revision is a series of systematic field studies focusing on clinical utility and global applicability. Dr. Michael C. Roberts, member of WHO’s Formative Field Studies Coordinating Group, will describe this program of research and present preliminary results from a study of how international clinicians think about categories of mental disorders. Given its global mission, WHO is attentive to the key role of...
culture in how mental disorders are experienced, presented, and defined. Universality of mental disorders and their symptoms is an inherent but unproven assumption of existing classifications. Dr. Rees Tapsell, a Maori psychiatrist who is working with WHO on the ICD revision on behalf of the New Zealand government, will describe a conceptual framework and program of work for addressing cultural applicability as a part of the classification.

**Deception, deviance and devaluing others at work: are employees really “bad to the bone”?**

Chair(s): RESTUBOG, S. L. (The Australian National University)

Discussant(s): GROTH, M. (The University of New South Wales)

This symposium consists of four papers that examine the interconnections between deviance and employee outcomes. Deviance (e.g., lying, rumour spreading) leads to negative consequences for employees such as revenge-seeking, sexual harassment, and social undermining. The first paper examines the dynamic process of lying that can escalate over time and result in a corporate culture where lying is viewed as legitimate. The second paper integrates research on psychological contract breach, revenge cognitions and rumour spreading as a form of employee deviance. The third paper reports on target vulnerability of sexual harassment in the nursing profession. The fourth paper examines the effects of associating with a devalued individual. Finally, our discussant focuses on the implications of the research papers in advancing theory and practice in studying the dark side of organisational behaviour. In particular, this symposium enhances participants’ knowledge in three specific areas: (1) Participants will be exposed to a process model of deviance that explores how interpretation of behaviours such as lying shift from “deviant” to “legitimate” over time. By linking the process model of interpreting deviance (Presentation 1) with examples of a specific form of deviance (rumour spreading – Presentation 2) the symposium extends understanding of how organisational cultures of lying and mistrust arise, are perpetuated, and become accepted as the norm. (2) Much research on employee devaluation narrowly conceptualises it as being perpetrated by a co-worker on the basis of an employee characteristic (e.g., race). This symposium takes
a novel approach by considering the role of individuals who are not members of the organisation. By contrasting employees who undertake paid (presentation 3) and unpaid (presentation 4) care, the symposium provides a broader and more thought provoking perspective on role of organisational “outsiders” in employee mistreatment. (3) Employees who experience negative behaviours have lower commitment and are more likely to turnover. This symposium enhances our understanding of how mistreatment is interpreted by exploring how the affected employee’s cognition (i.e., psychological contract breach, revenge cognitions – Presentation 2) mediates the relationship between mistreatment (i.e., harassment – Presentation 3; social distancing – Presentation 4) and organisational withdrawal.

**Going down the slippery slope: A preliminary process model of organisational lying**

CHAN-SERAFIN, S. (The University of New South Wales)

Despite the pervasiveness of lying in organisations and its likely deleterious effects, the temporal character of lying is an understudied phenomenon in organisational research. As revealed by recent corporate scandals, lying is not static; rather, it is a dynamic process that escalates over time. Drawing upon psychological and philosophical literatures, I theorize how the process of lying unfolds in organisations. During Phase 1, lying occurs at an individual level, whereby after telling one’s first lie, an organisational member tends to go down the slippery slope and lie again when given opportunities to do so (i.e., domino lying). If no attempts were made to halt such individual lying, Phase 2 is initiated and domino lying metastasizes into a culture of lying. In such a culture, acts of lying are carried out by multiple organisational members, become embedded and are viewed as legitimate behaviours within the organisation. The presentation will focus on theory development for Phase 1 and some preliminary experimental data supporting such a phase will be provided. Individual differences such as integrity and psychological mechanisms such as individual’s role conflict, escalation of commitment, and reinforcement traps will be discussed to explain why liars go down the slippery slope. The theoretical arguments that will be presented suggest that the notion “one lie perpetuates many more” is part of human nature. This theoretical model is a preliminary step towards understanding the dynamics of how lies spread, an occurrence that, when left unchecked, can be very damaging to organisations. In terms of practical implications, understanding the process of lying and its escalation can better equip organisational psychologists, as well as management, to minimize this damaging practice in organisations.

Keywords: lying, research, organisational psychologists, management, organisations

**An eye for an eye, a tooth for a tooth: investigating the role of revenge and individual differences in predicting rumor transmission**

KIAZAD, K. (The University of Melbourne)

Psychological contract breach occurs when employees perceive that their organization has failed to fulfil its promised obligations. This paper represents an initial effort to integrate research on psychological contract breach, revenge cognitions, and rumor spreading conceptualized as a form of employee deviance. Specifically, we test the notion that breach triggers a desire for revenge which in turn precipitates willingness to spread a damaging rumor about the organisation. The hypotheses were tested using a 2 x 2 between groups factorial design. Participants were randomly assigned to one of four conditions that manipulated psychological contract breach (no breach vs with breach) and source credibility (low vs. high). A contrasting vignette was designed to manipulate the independent variables. The use of an experimentally manipulated vignette enabled greater control over the independent variables and can eliminate the potential ethical problems associated with manipulating the actual experience of broken promises. In Study One, data were collected from 100 Australian retail employees, while data from Study Two were collected from 82 Australian retail workers. Study One revealed a main effect of breach on
rumor transmission intentions, with only a partial mediation of revenge cognitions in this relationship. Study Two also found a main effect of breach on transmission intentions, but full mediation of revenge cognitions in the relationship between breach and rumor transmission intentions. Study Two also found that negative reciprocity and trait anger moderated the relationship between breach and revenge cognitions; the positive relationship was stronger for those with high levels of negative reciprocity and trait anger compared to those with low levels of these traits. Overall, findings suggest that psychological contract breach precipitates rumor transmission, and that the likelihood of an employee reacting as such is influenced by revenge cognitions and individual differences.

Keywords: psychological contract, revenge cognitions, rumor spreading, employee deviance, ethical issues

Sexual harassment in nursing: Understanding target vulnerability

COGIN, J. (The University of New South Wales)

This study aims to assess the prevalence and determinants of sexual harassment in the nursing profession. The effect of a nurse’s socio-demographic characteristics and aspects of their daily work environment (the sex of their supervisor and harasser and job gender ratio) are investigated. Drawing on a variety of theoretical models and addressing a limitation of a previous study, the experiences of male and female nurses are compared. Five hundred and thirty eight questionnaires were collected from qualified and student nurses working in eight different hospitals across metropolitan and rural areas in Australia. Sexual harassment in nursing is high with more than 60% of female nurses and 34% of male nurses reporting a sexual harassment incident in the 48 months prior to this study. Patients were identified as the main perpetrator. The effect of a nurse’s socio-demographic characteristics and job gender ratio were important in determining the likelihood of sexual harassment. Findings also indicate that aspects of a nurse’s daily work environment, gender and age combine to influence harassment severity levels. Differential effects for sex of supervisor, education and other variables were uncovered. A focus upon outcomes of sexual harassment have led to a concentration on reactive measures to deal with it (such as complaint processes and reporting mechanisms) and the neglect of new initiatives for preventing harassment occurring in the first place. Rather than just acknowledging the prevalence of sexual harassment, this study identifies some of the core organisational facilitators of it which heighten an individual’s vulnerability to being harassed. Understanding the determinants of sexual harassment allows for more effective allocation of resources to managing this growing problem.

Keywords: sexual harassment, nursing, organisational facilitators, socio-demographic characteristics, work environment

The cost of caring: Stigma by association

BAINBRIDGE, H. (The University of New South Wales)

Researchers have focused on the experience of those who possess devalued characteristics such as race, disability, age, and social class. Each devalued individual operates within a broader social context and consequently each is likely to establish social relationships with people who do not possess these characteristics. For these associated people, studies suggest that the relationships can have unfavourable effects (e.g., Birenbaum, 1992; Mehta & Farina, 1988; Neuberg, Smith, Hoffman, & Russell, 1994). While a growing literature comments on these negative outcomes, a significant barrier to ongoing research has been the lack of carefully developed empirical measures. This paper reports on the development of two empirical measures pertaining to the effects of associating with a devalued or stigmatised other. Stigma by association and valuation by association items were developed via two approaches. The first approach to item development consisted of an extensive review of published research relevant to associates of the devalued. The second approach consisted of 32 interviews with individuals (caregivers) who provide unpaid, informal assistance to people with a disability. The purpose of these interviews was to elicit instances of stigma by
association or valuation by association. These instances were utilised to develop stigma by association and valuation by association items for inclusion in the two measures. Survey data was then collected to allow examination of the content validity, internal consistency and construct validity of the stigma by association and valuation by association measures. Evidence is provided in support of the content validity, internal consistency, and construct validity of the measures. The stigma and valuation by association measures were demonstrated to be distinct from one another. The development of the two measures in this study is an important step towards a better comprehension of the extent to which people are affected by the relationships they maintain with the stigmatised. These measures will enable a better understanding of stigma by association and valuation by association effects by allowing researchers in this field to utilise well constructed measures of the concepts under study.

Keywords: stigma, valuation, caregivers, stigma, devalued characteristics

Determinants, catalysts, and barriers to sustainable behavior: Psychological influences and financial incentives

Chair(s): BOLDERDIJK, J. W. (University of Groningen)

Most researchers agree that in order to effectively tackle environmental problems, we need to reduce current consumption behavior, as well as develop and adopt new energy-saving technologies. Reliance on either strategy alone is widely recognized to be inefficient. For instance, new technologies will only help to reduce environmental problems if they are widely adopted and used properly. This symposium discusses how both social psychological processes and financial incentives can be employed to change current consumption patterns and to promote the adoption of new technologies. In this symposium, we explore and identify factors that determine individuals’ willingness to curtail their current consumption practices, as well as those that influence individuals’ willingness to accept new, energy-efficient technologies. Furthermore, the symposium will discuss the extent to which normative influence and financial incentives can be used to change behavior. The presented research is conducted via different methodologies, ranging from surveys to field experiments, and the interplay between these methodologies will also be discussed.

The effects of pay-as-you-drive vehicle insurance on driving volume and style

BOLDERDIJK, J. W. (University of Groningen)

Technological innovations may help increase fuel efficiency and reduce emissions, but their effects are limited if car users do not change their driving behavior simultaneously. Thus, persuading drivers to increase the fuel efficiency of their driving style (for instance by maintaining the speed limit), as well as to
reduce their travel volume, may prove crucial in achieving significant cuts in CO2 emissions. Our aim was to determine if financial incentives can be an effective tool in changing driving behavior. In collaboration with five Dutch car insurance companies, we tested how a pay-as-you-drive vehicle insurance would affect driving style and driving volume. In total, 157 young drivers, aged between 18 – 27 years could save 50 Euros on their monthly insurance premium when by driving less and keeping speed limits. Driving behavior was monitored through GPS technology during one year. Analyses show that, relative to the control group, participants that received the financial incentive committed significantly less speed violations, but not did not reduce their mileage. It was concluded that financial incentives reduced driver speed, but did not reduce mileage.

**Keywords:** fuel efficiency, driving behaviour, financial incentives, car insurance, speeding

### The effectiveness of prompts and models on food composting by restaurant patrons

**SUSSMAN, R. (University of Victoria)**

Composting of biodegradable waste is an effective means of reducing landfill garbage and improving the state of our environment. The widespread adoption of this behaviour by community members is subject to various social psychological processes, and our aim was to determine whether social norms could be used to encourage use of a compost bin in public eateries. Table top signs outlining a pro-composting injunctive norm, and models demonstrating the behaviour (descriptive norm) were employed in two shopping centre food courts and a fast food restaurant to attempt to increase the use of public compost bins. When diners viewed models composting ahead of them, they were more likely to compost as well. However, the signs had no effect on composting rates, either alone or in combination with the models. Results support the idea that behaving in a pro-environmental manner around others can have an influence on them to behave pro-environmentally as well.

**Keywords:** composting, biodegradable waste, environment, social norms, fast food restaurant

### Factors influencing household energy use

**VAN DER WERFF, E. (University of Groningen)**

Various studies reveal that household energy use is mainly related to socio-demographic variables, such as income and household size, while motivational factors play only a minor role (e.g., Abrahamse, 2007; Gatersleben, Steg & Vlek, 2002). However, most studies on household energy use did include a few motivational factors only. In this study we tested to what extent a comprehensive set of motivational factors derived from the theory of planned behavior and the norm activation model influence household energy use. We will test the predictive power of both models separately and in combination in a survey of households in the Netherlands (N = 500). Besides total household energy use, we examine how these motivational factors affect specific energy-related behaviors, including showering, energy efficient driving style and meat consumption. The results will show whether the theory of planned behaviour, the norm activation model or a combination of both models will predict different types of household energy use best. We will discuss the main results and the theoretical and practical implications of our study.

**Keywords:** household energy use, motivational factors, theory of planned behavior, norm activation model, Netherlands

### Psychological influences on the acceptance of new energy technologies: An investigation of the Plug-in Hybrid Electric Vehicle (PHEV)

**KORMOS, C. (University of Victoria)**

Historically, consumers have been reluctant to adopt new technologies, especially those that appear to be radically different (Nye, 1998). And yet, technological innovation is essential for mitigating climate change. For instance, new transportation technologies, such as the plug-in hybrid electric vehicle (PHEV), hold the potential to eventually render transportation-related petroleum use obsolete (Denholm &
Short, 2006); but so far most research has mainly focused on the technical barriers to PHEV technology (Sanna, 2005; Sovacool & Hirsh, 2008). Therefore, this study aims to identify the psychological factors that influence acceptance and adoption of new energy technologies, and to rank these factors in terms of their relative importance. A community sample of 120 rural and urban drivers will view an online commercial for an upcoming PHEV, as well as details about its financial, technical, and behavioural aspects. Next, participants will indicate their perceptions of, and willingness to adopt, the technology via a series of quantitative and qualitative questions. Then, questionnaires will assess potential psychological influences on the acceptance of this new technology, including (1) anticipated changes to QoL (Poortinga et al., 2004), (2) barriers to sustainable behaviour, such as habit and social norms (Gifford, 2008), and (3) five types of product risk perception (Mitchell, 1998). Finally, participants will report their expected annual fuel savings and time anticipated to recover cost of the vehicle via fuel savings, and then will choose between various tax credit incentives. Data collection is currently ongoing. It is expected that those who perceive a higher degree of psychological barriers will be less willing to consider investing in this new technology. Decreased reliance on the internal combustion engine will result in various benefits, most importantly the mitigation of climate change. Research on the social factors that influence the acceptance of such technologies is both essential and timely. Without it, technical barriers may be resolved only to find that social issues still thwart widespread acceptance of climate change-relevant technologies.

Keywords: climate change, plug-in hybrid electric vehicle, transport, sustainable behaviour, new technologies
our increasingly complex world. Key learning objectives will include: A brief overview of emerging models of leadership that are both informed by developmental psychological theory, complex adaptive systems theories and positive; An understanding of the role of executive coaching in helping to create shifts in the developmental complexity of leaders’ meaning making and systemic understanding; and the practical application of the emerging mindfulness and wisdom literatures in positive psychology for leadership development. The results of ecologically valid research conducted in a range of organisational settings across a range of industries will be presented to support these conclusions drawn in this symposium.

The four factor model of leadership: Empirical foundations and practical application

CAVANAGH, M. (Sydney University, Sydney)

This paper presents a new model of leadership, the Four Factor Model of leadership, and reports preliminary results of a large scale longitudinal study into developing leaders for high stress workplaces based on this model. This three year study represents the largest study yet conducted into developmental coaching and leadership. For leaders to be successful, they need the ability to select and organise behaviours into coherent responses sensitive to the systemic features of the situations they face. Building on the work of constructive developmental theorists we contend that the ability to do this relies on the complexity of the leader’s ability to understand, critically consider and integrate multiple competing perspectives into higher order perspectives in order to guide effective action. We call this ability Perspective-Taking Capacity (PTC). In order to support and implement these new perspectives, leaders need skills associated with self regulation, the identification of systemically useful purpose and the ability to create positive patterns of communication. The study is a three year longitudinal study involving 270 participants drawn from two industries. Health and Law. Participants were medical, allied health and general staff in a Network of five Sydney based hospitals and partners, senior associates and support staff from a major Australian law firm. Both of these settings represent high stress complex workplaces undergoing significant change. 6 cohorts of participants were randomized into two treatment groups and a waitlist control group. The first treatment group participated four day workshops aimed at identifying and developing perspective taking capacity, mindfulness, strategic purpose and positivity. The second treatment condition involved 8 sessions of developmental executive coaching in addition to attendance at the developmental workshop. Preliminary results from qualitative and quantitative data will be presented identifying changes in subjective well-being, productivity, engagement, mental health and perspective taking capacity among participants. While analysis is still be undertaken, preliminary findings suggest that developmental coaching is perceived by participants as highly valued and useful in enhancing leadership performance, team engagement and the development of more effective perspectives on the leadership challenges faced by participants.

Keywords: leadership, four factor model of leadership, longitudinal study, coaching, perspective taking

Multi-perspective analyses of complex organizational changes and coaching

GREIF, S. (Institute of Business Psychological Research and Counseling, Osnabrueck)

Based on an integrative theory, change management is seen as managing the challenges associated with complex self-organizing interactions between multiple system levels (e.g. individual, group, organisation, national and international economies). Differing views of internal stakeholders contribute to this complexity. The paper shows how it is possible to analyse multiple stakeholders’ perspectives and use the results for coaching CEO’s and project managers. The Change Explorer process is a theory-based method that combines interviews data from the internal stakeholders at all levels of the organisation (CEO to lowest level) and data drawn from standard questionnaire scales. Differing from typical evaluations, this method not only assesses the
results of the changes, but also subjective causes of concrete positive and negative results, using presentation cards and structure diagrams of the individual’s subjective theories of the changes. Accompanied by coaching, the individual interviews and suggestions for improvements are analysed and utilized in a common evaluation workshop with all interview partners. Here change improvement groups are implemented. Their results are evaluated in follow-up workshops. Change Explorer methodology has been applied both in an international study of 432 successes and failures of organisational change projects and in a series of case studies, aimed at improving the success rates of near failure change programmes via coaching of the CEO and the project manager. Implementation of the Change Explorer process in change programmes which were on the brink of failure, led to strong improvements in the success rate of these programmes. The coaching of the CEO and project manager and the facilitation of the evaluation workshop focuses on a mutual showing of respect to different perspectives and contributions. In so doing, it activates the change readiness of the participants and liberates self-organized cooperation in improvement groups even when strong resistances and conflicts exist between leadership levels. This paper shows that the combination of multi-perspective interviews, workshops with stakeholders and targeted coaching seems to be a promising tool for an improvement the success of difficult change programs.

Keywords: leadership, change management, multiple system levels, change explorer process, coaching

Validation of a standardised measure of self-construal and Perspective Taking Capacity (PTC) for leadership effectiveness

ATKINS, P. (Australian National University, Canberra)

This study aimed to develop and validate a standardised instrument to measure an evolving sense of self in relationship to experience. The Developmental Stage Inventory (DSI-10) was developed using ideas from Kegan’s (1982; 1994) theory of adult development and self-determination theory (Deci & Ryan, 1985). It measures intrapersonal, interpersonal and cognitive elements of an individual’s self-construal by inviting people to assess their own capacity to stand back from their own self-interests, beliefs and assumptions in particular situations and adopt a systemic, dynamic and inclusive view of themselves, others and the world. Such mature perspective taking is arguably becoming increasingly important in modern workplaces but previous measures have either been narrowly focused or too time consuming and labour intensive to allow broad empirical testing. The DSI-10 contains scenarios and response items designed to target each of the 4 adult stages of development articulated by Kegan (1982; 1994). The instrument was administered to 120 professional staff working in a law firm and a hospital, along with a battery of other measures of personality, cognitive style, wellbeing and leadership as part of a larger intervention study involving coaching and leadership training. This study focuses on the cross-sectional elements of that broader study by assessing the factor structure of the instrument together with convergent and divergent validation evidence derived by comparison with other individual differences measures including Ardelt’s (2003) 3D-Wisdom Scale, the Multifactor Leadership Questionnaire (ref xx) and other measures of cognitive, emotional and social functioning. At the time of writing, the analysis is in a preliminary phase. Early results suggest that the instrument provides useful information on leader PTC that has not previously been measured by other instruments, and is likely to predict unique variance in a range of dependent variables relevant to leadership functioning. Having an instrument to quickly, easily and accurately assess self-construal and PTC is an essential step towards the development and refinement of theories and interventions focused on how leaders make sense of their leadership. This study highlights one potentially valuable approach to such an instrument and provides useful indicators for further research.

Keywords: standardised instrument, Developmental Stage Inventory, self-construal, perspective taking, leadership
Mindfulness, Leadership and the 4-Factor Model

SPENCE, G. (Sydney University, Sydney)

This paper discusses the relationship of mindfulness to leadership, using the conceptual framework provided by the 4-Factor Model. Mindfulness is an awareness process. It involves the purposeful, flexible deployment of attention towards momentary experience and an accompanying acceptance of it. Given increasing evidence that mindfulness enables more objective observation of cognitive, affective and behavioural processes and promotes intentional (rather than reactive) behavioural responses, it appears to be essential for effective leadership. As such, mindfulness represents the self-regulatory component of the model and captures an aspect of mental functioning that is central to all human development and growth. The data to be presented in this paper was collected from a 3-year longitudinal study involving 270 participants drawn from two industries (public health and law). Six cohorts of participants (3 per organisation; 45 per cohort) were randomly assigned to either a training only, training + coaching, or wait list control group. Mindfulness was measured using the Philadelphia Mindfulness Scale (PMS), a 20-item self-report instrument that measures the construct across two dimensions: present moment-awareness and acceptance. Whilst quantitative data analysis is still to be finalized, the design of the study will permit results from both cross-sectional and longitudinal analyses to be presented. As such, preliminary results will be presented to help clarify the relationship between mindfulness and other components of the 4-factor model (i.e. perspective-taking capacity, purpose & positivity). In addition, between-subjects repeated-measures analyses (i.e. pre, post & follow-up) will be conducted to assess the impact of the leadership intervention and its primary ingredients (i.e. leadership training and developmental coaching informed by the 4-Factor Model). Based on the theoretical relevance that mindfulness has for effective leadership, along with anecdotal feedback obtained from participants, it is expected that mindfulness will correlate strongly with the other factors of the theoretical model, thereby confirming its centrality to the model. Whilst it is also expected that leadership training and developmental coaching will enhance mindfulness over time, it is currently unclear to what degree this might occur. The nature and application of mindfulness training within executive coaching contexts will also be discussed.

Keywords: mindfulness, leadership, attention, mental functioning, 4-Factor Model
Developmental health psychology: Emerging themes and contemporary research

Chair(s): ZIEGELMANN, J. P. (Freie Universitaet Berlin; German Centre of Gerontology)
Discussant(s): ABRAHAM, C. (Maastricht University)

This symposium takes a distinct developmental perspective on health and aging. Four presentations from diverse backgrounds of health and aging present contemporary findings as well as emerging themes as applied to different phases of the life cycle. The present symposium highlights the application of advanced theoretical approaches to the study of health self-regulation and successful development across the lifespan. The overarching goal of the symposium is to apply a self-regulation perspective on health behaviors, health goals, and resources in the framework of successful development. The first contribution focuses on a high-profile health-related behavior (i.e., ecstasy use) in younger adults as a developmentally salient group and gives insights into the dynamics underlying starting, maintaining and ceasing ecstasy use. The main objective of the second contribution is to examine some contributions from psychology on the field of positive aging coming from a set of longitudinal, cross-sectional and cross-cultural research on optimal aging. Contribution number three employs a parallel-process, longitudinal evaluation of decline in physical health and functional ability on age-comparative self-rated health, and focuses on the adaptive use of enhanced social downgrading in older adults. The last empirical contribution posits that selection, optimization and compensation strategy use can be a central resource in health behavior change across the lifespan. This study aims to develop an intervention fostering strategy use and investigates whether the increase in strategy use explains intervention success. Finally, the discussant will discuss the various findings and theoretical approaches.

The audience will be given the opportunity for feedback. The three key learning objectives of this symposium are the following: First insights will be given how health self-regulation is functioning over the adult lifespan. Second this symposiums aims to present implications for designing intervention in an age sensitive way. Finally the aim is to illustrate how to translate theory into practice in the field of developmental health psychology.

The wild years: Young people passing in and out of ecstasy use

PETERS, G. J. (Maastricht University), ABRAHAM, C. (Maastricht University), KOK, G. (Maastricht University)

Ecstasy use is potentially damaging, but remains a poorly understood phenomenon. Health promotion efforts could be enhanced by a better understanding of the dynamics underlying starting, maintaining and ceasing ecstasy use. We aimed to identify and map determinants of a series of ecstasy-use behaviour patterns. Based on a meta-analysis of 11 studies and a narrative review of 22 studies, we designed and conducted a qualitative interview study in the Netherlands, gathering data in both focus groups and individual interviews (N = 32). We then combined the insights from all these studies in a quantitative longitudinal survey, which we administered to several samples through the internet (N = 6174). This survey assessed participants at three time points measuring determinants of (and reasons for) 15 ecstasy use and use-related behaviors. Most quantitative research into ecstasy use has examined determinants of using ecstasy, rather than, for example ceasing use. Our quantitative online survey also shows that there are different determinants of starting and ceasing ecstasy use. This means that models of ecstasy which predominate in the quantitative literature may not be good guides to the processes through which people cease using ecstasy. Our qualitative and quantitative data both suggest that for most people ecstasy use is a phase that ends without intervention as goals and lifestyles change through maturation. The results suggest that health promotion interventions may most effectively
target harm reduction rather than abstinence. Therefore, results characterising determinants of “chilling out”, an important harm reduction practice, will be reported. Determinants of ecstasy use do not necessarily provide a good guide to the modifiable determinants of other ecstasy-use behaviour patterns such “chilling out” or ceasing use. Behaviour-specific analyses such as those presented here are required. It appears most ecstasy users cease ecstasy use autonomously after a period of use. This implies that health promotion may be best focused on harm reduction, rather than abstinence, messages.

Keywords: ecstasy use, health promotion, harm reduction

Healthy aging: Some empirical results

FERNÁNDEZ-BALLESTEROS, R. (Universidad Autonoma de Madrid), ZAMARRÓN, M. D. (Universidad Autonoma de Madrid), LÓPEZ, M. D. (Universidad Autonoma de Madrid), MOLINA, M. A. (Universidad Autonoma de Madrid), SCHETTINI, R. (Universidad Autonoma de Madrid), SANTACREU, M. (Universidad Autonoma de Madrid)

From an evidence based point of view, it has been during the last decades of XX Century, when from the fields of biomedicine and social sciences emerged the so called “new paradigm” or “revolution” on the field of ageing and in a broad sense in the science of aging: a positive view. The core of this new paradigm is a new construct: healthy, successful, optimal, active or positive ageing. The main objective of this presentation is to examine some contribution from psychology on the field of positive ageing coming from a set of longitudinal, cross-sectional and cross-cultural research on optimal aging. Results from three research Projects will be presented. First of all a cross-cultural study (ten countries from Latin American and Europe with comparisons with Japan and USA) about the “pop” concept of “aging well” will be presented. Secondly, a cross-sectional study about active aging (ELEA) assessing independent elders from 55 to 75 years old through anthropometric measures, bio-behavioral and psychophysiological characteristics, health and life styles, cognitive functioning, affect and personality traits and social relationships will be synthesized. Finally, a longitudinal study conducted with nonagenarian (90+ project) will be also presented examining the importance of behavioural and psychological factors for mortality and survival. A multidimensional concept of aging well emerged in which psychological factors are relevant. Also, psychological functioning seems to be an important predictor for healthy aging as well as psychological factors predict mortality. Finally, a multidimensional empirical concept of active aging distinguish between those older than 90 who die and who do not. Active and healthy aging is an extraordinary important concept for psychology and psychologist because psychological factors seem to be central components for aging well.

Keywords: ageing, positive ageing, healthy aging, mortality

Adaptive use of enhanced social downgrading in older adults: A parallel-process, longitudinal evaluation of decline in physical health and functional ability on age-comparative self-rated health

SARGENT-COX, K. A. (Australian National University), ANSTEY, K. J. (Australian National University), LUSZCZ, M. A. (Flinders University)

We tested the development view of enhanced social downgrading buffering self-evaluations from age-related health decline and loss, against a cognitive-constructivist contrast-identification model that hypothesises that severe frailty reduces reserves and resources for using coping strategies such as enhanced social downgrading. We examined how an accumulative and irreversible health threat (changes in self-reported physical and functional health) affects the trajectory of age-comparative self-rated health item (“How do you rate your health compared to others your own age?”) over 12 years (4 waves) in a large (N = 2087 at wave 1; 50.6% males) population-based sample of older adults (age 65 to 103). Parallel process latent growth models reveal that initial health threat, as measured by greater number of medical conditions and functional disabilities (ADLs), increase the use of enhanced social downgrading in older adults.
in the following measurement occasion (medical conditions, Beta=0.02[0.01,0.02]; ADLs, Beta=0.05[0.01,0.09]). However, with increased physical and functional loss over time, the likelihood of older adults rating their health as ‘better’ than others significantly declines (medical conditions, Beta=-0.23[-0.46,-0.01]; ADL, Beta=-0.75[-0.75,-0.22]). Results suggest that accumulative and irreversible health decline may place limitations on older adult’s ability to cognitively construct a ‘worse’ off reference group and subsequently use social downgrading in an adaptive and functional manner.

Keywords: social downgrading, self-evaluations, coping strategies, health threat

Developing a selection, optimization, and compensation intervention to foster lifelong autonomy and resources (FLARE)

ZIEGELMANN, J. P. (Freie Universität Berlin & German Centre of Gerontology), GELLERT, P. (Freie Universität Berlin & German Centre of Gerontology)

Selection, optimization and compensation strategy use can be a central resource in health behavior change. The aim of this study is to develop an intervention fostering strategy use and investigate whether the increase in strategy use explains intervention success. A sample of 400 individuals aged 60 to 85 completed an intervention to increase physical activity. The primary goal of the intervention was to foster physical activity and participants were randomly assigned to a standard treatment (i.e., planning of health behavior change) or to a treatment with a specific focus on strategy use (i.e., planning and strategy use). Questionnaires assessed key concepts of successful aging, strategy use and the amount of physical activities performed pre-intervention and one month thereafter. Compared to the standard treatment group there was a significant increase in strategy use as well as physical activity. Strategy use emerged as mediator of intervention success in terms of physical activity. The amount of physical activity was an important predictor of successful aging indicators. This study shows that strategy use can be trained in interventions focusing on older adults and that it is an important component in interventions fostering the adoption and maintenance of physical activity.

Developments in measurement technologies

Chair(s): BARTRAM, D. (SHL Group Ltd)
Discussant(s): HATTIE, J. (University of Auckland)

Measurement technologies have changed in many ways in the past decade. The present symposium can do no more than present a sample of the advances that have taken place. The symposium brings together leading exponents in the field of measurement to describe how technologies have developed to increase the efficiency of assessment methods. The symposium will provide attendees with insights into the latest developments in the application of multi-dimensional IRT models to forced-choice personality assessment item formats; the growth of structural equation modelling (SEM) and developments that have taken place in the application of SEM and the design and application of new item formats. Some insights into future developments will be provided by the discussant.

Application of a multi-dimensional IRT model to scoring the OPQ32

BARTRAM, D. (SHL Group Ltd)

Item Response Theory has been widely applied in the area of ability and attainment testing. It has been less commonly applied to the development of scoring models for personality assessment. In this presentation alternative item formats for use in personality assessment – forced choice versus single stimulus – will be discussed and the development of a multidimensional IRT scoring model for use with the OPQ32’s forced-choice format items will be outlined. This development is significant in that it makes possible the production of normative scale scores from item formats that in the past always produced ipsative scale scores. The benefits of this are discussed. In particular, the paper will focus on the value of forced choice normative instrument construction on reducing systematic biases in testing associated with high stakes assessment settings and cultural differences. We are now able to realise these benefits without the disadvantages associated with ipsative scale properties.

Keywords: Item Response Theory, personality assessment, testing, systematic biases

The evolution of structural equation modeling as a measurement technology

BYRNE, B. (University of Ottawa)

The growth of structural equation modeling (SEM) over the past 35 years or so is nothing short of phenomenal! Within the framework of psychological research, at least, it has evolved from being a mere whisper in the early 70’s, a curiosity in the late 70’s, a practice of questionable repute in the early 80’s, a “hot” statistical procedure in the late 80’s, through to its current status as a powerful and sound methodology capable of providing answers to a broad spectrum of research questions. Indeed, a review of the social science literature across this time span reveals an ever-increasing number of journal articles in which SEM applications have been used to address an array of substantive, as well as methodological issues. An interesting offshoot of its popularity has been the equally expanding, albeit somewhat more subtle growth of computer software capable of handling the statistical rigors demanded by the SEM methodology. In combination, each component of this symbiotic pair serves as a stimulus for the other in advancing the practice of SEM methodology. As substantive researchers increasingly seek more comprehensive answers to their research questions, statistical researchers are challenged to further advance the capabilities of SEM methodology, which in turn, necessitates further development of existing SEM software programs. Importantly, the relevance of these important challenges extends across a broad range of enterprises, from the hallowed halls of academia to the hard core business world of large scale testing and development. In this symposium, I present a brief glimpse into a few of the past challenges in using SEM methodological strategies, followed by an overview of present
New multiple choice format enhances measurement quality, security and fairness

FOSTER, D. (Kryterion Inc)

The multiple choice item type has not varied significantly since the early 1900s. Usually the item stem is presented followed by several options, one of which is keyed as the correct one. Examinees select one option from those presented. This format has worked well on paper-and-pencil exams and has performed similarly when exams were converted to computer administration. However, with computerization, it is possible to vary the presentation format leading to significant advantages over the traditional format. One such variant is the new Discrete Option Multiple Choice (DOMC). In its simplest version, after displaying the stem, the DOMC item type presents the options one at a time and asks examinees to declare if each is the correct one or not. With this method not all of the options need to be displayed, significantly reducing content exposure. In addition to this security advantage, measurement quality is enhanced by reducing content-irrelevant variance associated with particular “test taking skills” that exploit the simultaneous presentation of options and which have nothing to do with content knowledge or skills.

Keywords: multiple choice item type, paper-and-pencil exams, computer administration, discrete option multiple choice, content-irrelevant variance

Different flexible work arrangements, accounting for contextual and individual diversity

Chair(s): DETTMERS, J. (University of Hamburg)
Discussant(s): RIGOTTI, T. (University of Leipzig)

In the face of globalisation, changing markets and increased customer needs the requirement to act promptly and flexibly on demand are ever more pressing issues for companies. Companies try to cope with these requirements by using flexible work arrangements. Reilly (1998) describes various forms of flexibility on the establishment level, including numerical, functional, temporal, locational, and financial flexibility. With the rise of flexible employment arrangements, also scientific interest increased for studying underlying processes, relations, and protective factors that help to cope with stress related to flexibility-demands. However, research has produced conflicting findings on the psychological impact of flexible employment arrangements. This symposium on flexible work arrangements brings together experts in the field from different countries who investigated the effects of different forms of flexibility on workers in terms of well-being, motivation, performance and work-life-balance. Results of recent studies will be presented regarding different employment schemes, such as on-call work, “flexitime”, fixed-term contracts, temporary work and others. All contributions to the symposium take a consequent interactional perspective, honouring the underlying complexity of factors, including multilevel and longitudinal approaches in order to better understand mixed findings.

On-call work and well-being

DETTMERS, J. (University of Hamburg)

24h-availability of service and generally unsteady workloads require flexible working
hours. One form of flexible working hours in standard employment contracts is on-call work which combines spatial and temporal flexibility. On-call work as a background duty, which covers the work demands beyond regular working hours, has grown in importance over the past few years. As employees who are on-call must expect to be called at home during their free time, in the evening or at night, in order to complete work on-call work may affect recovery processes and work-life-balance. There is, however, considerably little research concerning whether, and in what way this form of work influences health and well-being. This study addressed this gap by investigating the impact of on-call work on well-being. 31 employees of an information-technology service organization aged between 40 and 49 years on average participated in the study. The study comprised two parts: In the first part, employees were initially subjected to a medical check and were asked to complete a questionnaire covering personal variables, evaluation of on-call work and work characteristics. The second part consisted of a diary study. Participants filled out a short questionnaire concerning indicators of well-being, leisure time activities and control variables on four work days with on-call duty and on four work days without on-call duty. Multilevel analyses including 248 days of 31 employees reveal significant effects of on-call work on well-being indicators at the day level (level1). Personal evaluation of on-call work and other personal variables (level 2) moderate the effects. Moderating effects of work characteristics are inconsistent. The results of the presented study point at the importance of personal evaluations in terms of perceived legitimacy and strain attributed to on-call work. The inconsistent moderating effects of theoretically important work characteristics suggest further research including larger samples and more variance in work characteristics.

Keywords: employment, on-call work, work-life balance, well-being, stress

Impact of contextual factors on organizational level for attitudes and well-being of temporary work force

Temporary employment has become one of the primary human resource instruments to promote organizational flexibility. Research on temporary employment contracts so far have been mainly focused on comparisons between temporary and permanent employees and looked for potential moderators on the individual level. The aim of this study is to test the impact of organizational level factors on job attitudes, and well-being of temporary workers. The initial cross-national sample used in this study includes data from 207 organizations from seven countries (Sweden, Germany, UK, Spain, Netherlands, Belgium, Israel) with overall 5288 employees, including 1981 participants on non-permanent employment contracts. The sample covers three different sectors, namely retail, education, and food-industry. On the organizational level, size of organisation, and the share of temporary workers are used as controls. Additionally certain human resource practices and equal treatment of different members of the workforce were assessed on the organizational level. On the individual level, besides of sociodemographic controls, self-reports on job characteristics are included as predictors in multilevel-models. Hierarchical linear models partition the within- and between-subjects variance of the dependent variable at the simplest level by fitting random intercept terms for each company. So, compared to standard regression techniques, they allow examination of within-subjects and between-subjects variance separately. Organisational commitment, job satisfaction, fairness, irritation, and sick leave were used as dependent variables. We tested for main effects, and cross-level interactions. First of all, it can be stated, that there is substantial variance between organizations in both the dependent and independent variables of this study. While many of the organizational characteristics, and individual variables showed main effects, also a set of significant cross-level interactions could be revealed. We conclude that organizational context plays a relevant role, over and above important individual level variables in predicting job attitudes, and well-being of employees. Certain features of human resource practices seem to be evaluated differently by the core, and
temporary work force, which leads to recommendations towards a differential human resource management strategy.

Keywords: temporary employment, organizational flexibility, job attitudes, well-being, job satisfaction

Motives to work as “temporary”: Deepening in the heterogeneity of temporary workers

GRACIA, F. (University of Valencia)

As temporary work is a characteristic of the landscape of current employment relations in Europe, there is an urgent need to better understand this collective of workers. In order to get this goal, research should consider more complex models able to understand the heterogeneity of temporary workers. In this sense, some authors proposed a theoretical model to classify temporary workers into four groups based on their preference for temporary work and their perceived employability. This model has obtained empirical support in two studies. Differences have been found among the four groups of temporary workers, on a broad set of variables, including demographic, job context and content variables, job insecurity, job and organizational attitudes and performance-related variables. The aim of the present paper is to deepen in this model by analysing in a sample of temporary workers their motives to work as temporaries. The sample was composed by 1956 temporary workers of seven different countries. It was hypothesized that the four groups of temporary workers would differ in the motives to work with a non-permanent contract. Eight motives were explored: difficulty in finding a non-permanent contract, fit to my present needs or situation, a higher salary, more freedom, a stepping stone to a permanent contract, to get extra money, to acquire experience and practical knowledge, and not able to get another kind of contract. Descriptive analyses showed that “fit to my present needs” was the main motive for “boundaryless career” and for “career” temporaries. The main motive for “transitional” temporaries was “a stepping stone to a permanent contract”. Finally, “not able to get another kind of contract” was the main motive for traditional temporaries. Furthermore, one-way ANOVA tests were performed and significant differences were obtained for each of the eight motives. On the basis of these findings, it is concluded that heterogeneity of temporary workers should be considered in future research in order to understand to this group of workers. In this sense, the taxonomy of temporary workers that is proposed in this paper and that has obtained empirical support can be a useful framework.

Keywords: temporary work, employability, job insecurity, job attitudes, performance

Consequences of flexible employment under different employment conditions

GUEST, D. (King’s College, London)

British pharmacists have enjoyed distinctive opportunities in the labour market due to a shortage of qualified pharmacists. Consequently, many have an opportunity to choose the type of employment arrangements that best suit them. This raises the question of whether those who have chosen flexible employment arrangements are more or less satisfied with their employment than those on standard employment. The recent international recession has affected all labour markets, raising the question of whether flexible employment becomes less attractive for workers under these circumstances. The aim of this study is therefore twofold. First, to compare key outcomes of those in standard and flexible employment and secondly to determine how far these comparisons are affected by the changing economic and employment climate. Data were collected from stratified random samples of pharmacists in 2004 and 2009 (n = 1532 and 1400). Three types of flexible employment were examined: part-time working, temporary contracts and multiple job holding. Part-timers formed 38% of the 2004 sample and 31% in 2009; in 2005, 11% were in temporary contracts rising to 23% in 2009 and in 2005 24% had multiple jobs compared with 19% in 2009. In 1995, after controlling for a large number of relevant background variables, the results revealed very few differences between those on any kind of flexible contract and those on standard
contracts suggesting that employment flexibility was not disadvantaging pharmacists. The only significant differences were that part-time workers reported lower stress and lower work-life conflict and higher commitment and temporary workers reported less work overload. In 2009, in the context of recession, part-time workers reported significantly lower job satisfaction and occupational commitment; temporary workers reported lower job satisfaction and lower organisational and occupational commitment while multiple job holders reported higher general job satisfaction. On the basis of these findings, we conclude that reactions to the experience of flexible employment are determined to a significant extent by the wider economic context. At the same time, we note that different types of employment flexibility have different consequences. Both findings should be taken into account in considering the impact of employment flexibility.

Keywords: flexible employment, employment, pharmacists, occupational commitment, job satisfaction

Career uncertainty and well-being of young scientists

HOEGE, T. (University of Innsbruck)

Academic careers are often a risky and uncertain journey. For example, in most countries temporary employment contracts are more the rule than the exception for young scientists. With respect to flexibility demands and career uncertainties scientific careers are to some extent prototypical for careers in general (Baruch & Hall, 2004). Against this background the presented study investigates the relationship between career uncertainty, job insecurity as well as conflicts between career goals vs. private life goals and general well-being among young academics before they have reached full professorship. The sample of the reported web-based questionnaire study consists of 702 scientists from Austria, Germany and the United Kingdom. Participants work in different academic disciplines. Results from multivariate statistical procedures (ANCOVA, SEM) give evidence that career uncertainty and conflicts between career and private life goals are affected by the employment relationship (temporary vs. permanent). Moreover, career uncertainty, goal conflicts and impaired well-being are strongly related. The relationship between career uncertainty and impaired well-being is partially mediated by the experience of an effort-reward imbalance. Furthermore, the effect of actual job insecurity on impaired well-being is mediated by the more long-term and future-oriented career uncertainty. Controlled for age, country and academic discipline, results show that female participants reported a higher level of career uncertainty and goal conflicts than their male colleagues. It can be concluded that career uncertainty and conflicts between career goals and private life goals are significant problems among young scientists. National policies and academic institutions should provide clearer and more transparent career paths - including more stable employment relationships - and focus even more on gender differences. In general we argue that the concept of career uncertainty as well as consequences for individuals’ “personal projects” including the work and private life domains should be more strongly considered in research on the possible detrimental effects of contingent employment.

Diversity matters: New findings regarding team performance and health

Chair(s): WEGGE, J. (TU Dresden), STAMOV-ROSSNAGEL, C. (Jacobs University Bremen)

Numerous researchers have posited that diversity constitutes a potential for enhanced performance in teams due to a broadened range of task-relevant experience and perspectives. However, empirical research has yielded mixed findings. Given that high levels of diversity are often inevitable for organizations, this is a disappointing state of affairs. Thus, there is an urgent need for more research that helps us to better understand how different types of team heterogeneity affect important organizational outcomes. In this symposium, we offer new theoretical and empirical insights into how age and gender diversity are related to various organizational outcomes, such as creativity, innovation, health disorders, and performance.

In the first contribution, empirical findings are presented showing that age diversity is only positively related to innovation under two conditions: when there is a high appreciation of age diversity and when levels of burnout are low. In the second contribution, the authors emphasize the importance of considering team climate and the salience of age diversity when examining the relationship between diversity and burnout. In the third paper, an important nuance is introduced that has often been neglected in previous research: the proportion of males and females. Results show that female employees report more disorders as their numerical dominance in the team increases, while males’ health disorders remained unchanged. In a similar vein, the fourth contribution reports results from a set of studies that indicate the importance of diversity faultlines and gender composition for group problem solving. In the last presentation, the authors offer new insights regarding the importance of diversity beliefs for effective teamwork, including diversity beliefs of supervisors. Together, these five contributions broaden our understanding of the effects of both age and gender diversity on organizational outcomes. While confirming that diversity holds potential to enhance performance, all presentations make clear that caution, rather than undiscriminating praise, is warranted when levels of organizational diversity increase. Negative effects are just as likely as positive outcomes. Ensuring that demographic heterogeneity will be an asset rather than a liability requires informed steps that are rooted in a sound knowledge of the complex nature of diversity’s effects.

Age diversity and innovation: The moderating role of diversity beliefs and burnout

WEGGE, J. (TU Dresden)

Based on previous research, it can be argued that age diverse teams do possess a variety of perspectives and knowledge that can be beneficial for both team performance and innovation. However, since negative effects of age diversity are often found, it is obvious that age diverse teams might be not willing or able to communicate and share knowledge accordingly. The present research tries to extend prior approaches to explain this observation by examining two new moderator variables – appreciation of age diversity in teams and burnout. More specifically, based on the diversity and burnout literature we propose that age diverse teams show only high innovation if diversity beliefs are positive and levels of burnout are low (ensuring enough emotional power and flexibility in thinking). The effect of age diversity (SD) in teams (archival data) on innovation was investigated within a sample of German pension offices, composed of 459 officers working in 67 groups in a cross sectional study. We developed a new scale assessing appreciation of age diversity (α = .93). Burnout was assessed with five items from the MBI (α = .92) and innovation was measured with 7 items drawn from Janssen (2004; supervisor judgments, α = .96). Aggregation of the appreciation and burnout scales to the team level was justified (Rwg-values > .70). As expected, appreciation of age diversity moderated the relationship between age diversity and innovative behaviour as age
diverse teams showed higher levels of innovation only when appreciation of age diversity was high. Furthermore, as expected, it was found that high levels of burnout in teams resulted in lower levels of innovative behaviour. Moreover, the expected three-way interaction was significant as the innovation enhancing effect of age diversity was most pronounced under the condition with high levels of appreciation of age diversity and low levels of burnout. Taken together, these findings extend the literature on age diversity and innovation. The results suggest that both appreciation of age diversity and burnout play a significant role in predicting and explaining effects of age diversity on team innovation.

**Keywords:** age, performance, burnout, diversity, innovation

### Multilevel analysis of main and interactive effects of team climate, age diversity and salience on burnout and job satisfaction

**DIESTEL, S.** (Leibniz Research Centre for Working Environment and Human Factors)

The present study focuses on cross-level effects of age diversity and team climate on experience of job strain as well as on employee’s affective job attitudes. Previous research on the effects of age diversity revealed emotional exhaustion and job satisfaction as relevant outcomes being considerably affected by age diversity, social and cognitive intragroup conflicts (Blachnik et al., 2009). However, all analyses were conducted on group level and, thus, empirical evidence on cross-level effects on individual outcomes is largely absent. Moreover, team climate has been also neglected in the literature on diversity. Indeed, recent findings indicate that high team climate fosters elaboration of diverse information and acts as a moderator on the relationship between group characteristics and outcomes of the group (Eisenbeiss et al., 2008). Consequently, we tested whether age diversity as a group-level variable exerts direct effects on exhaustion and job satisfaction and whether team climate as a group-level moderator buffers the adverse effects of age diversity and salience on both individual outcomes. Participants were employees of a large supply institution of a federal state in Germany conducting administrative and service work. A total of 408 participants completed a questionnaire and all respondents were assigned to 66 teams. In order to test the primary hypotheses, hierarchical linear models (HLM; Raudenbush & Bryk, 2002) were specified to predict exhaustion and satisfaction using salience of age diversity as an individual predictor and team climate as well as age diversity as a group-level predictor. Restricted Maximum Likelihood estimations revealed significant main effects of team climate on exhaustion and on satisfaction. Furthermore, age diversity and team climate significantly interacted in the prediction of exhaustion in that the relationship between age diversity and exhaustion was positive when team climate was high. Finally, team climate also moderated the association between salience and exhaustion in that the effect of salience on exhaustion was positive when team climate was low. The present study clearly indicates that team climate is an important factor influencing the effects of age diversity on individual strain experience. Further studies should also introduce other relevant outcomes, like performance.

**Keywords:** age diversity, job satisfaction, team climate, diversity, exhaustion

### Men’s and women’s health disorders as a function of gender composition in work teams: A multilevel examination

**SHEMLA, M.** (TU Dresden)

Past research investigating the relationship between gender and occupational health has been inconclusive, providing evidence for both the idea that men and women differ in regard to amount of health symptoms (Guppy & Rick, 1996), as well as to the claim that women experience decreased health status (Matud, 2004). In our opinion, previous studies had one main impediment, namely the examination of the relationship between gender and health as a single-level phenomenon, hence ignoring the notion that both attain their meaning from their surrounding context (Kanter, 1977). Therefore, we scrutinize the cross-level influences on the relationship between gender and health. We suggest, as an explanation to
the inconsistent findings in the literature, that gender differences can be attributed to the specific gender composition in teams. Particularly, we expect team gender composition to moderate the relationship between employees’ gender and self-rated health disorders such that women’s health disorders increase with increasing proportions of women in a team, but men’s health disorders remains uninfluenced by team gender composition changes. The study consisted of 3,078 females and 1,460 males working in German tax-offices. Since the data were hierarchical in structure, with participants nested within 222 teams that were, in turn, nested within 8 cities, we used hierarchical linear modeling to test our hypotheses. As expected, we found that individual-level gender was not related to health disorders but that team gender composition moderated this relationship. Specifically, we found that women reported more health disorders as the proportion of female employees in the team increased, while men’s self-reported health disorders remained invariant with team gender composition changes. The finding that gender composition exerts a differential influence on health disorders of men and women offers a possible explanation to the inconsistent findings in the literature. The results are in line with the notion that women’s health-related behaviors are a context-dependent phenomenon and support the claim that male employees maintain male-like behaviors both in minority and in majority.

Effects of diversity faultlines, task motivation, and diversity beliefs on group complex problem solving

MEYER, B. (Universitaetht Zuerich)

Prior research shows that faultlines – the convergence of diversity attributes in groups splitting the group into homogeneous subgroups – can decrease group performance. Studies based on the categorization-elaboration model (CEM; van Knippenberg et al., 2004) show that faultlines can be bridged by pro-diversity beliefs and that this effect is mediated through the elaboration of task-relevant information. The CEM also assumes that task motivation can lead diverse groups to high levels of performance, but this assumption has not been tested yet. We thus examined whether task motivation can overcome the negative effects of faultlines on group performance and whether such an effect is contingent on the diversity beliefs of the group members. We also tested whether such effects are mediated by information elaboration. We carried out an observational laboratory study with 42 groups that worked on a computer-simulated complex problem solving scenario. Group diversity was operationalized as diversity faultline strength based on gender, age, and educational background. Measures for information elaboration were obtained by coding the videos of the group interactions and from the computer simulation. Task motivation and diversity beliefs were surveyed with questionnaires at different measurement times. Diversity beliefs alone were unable to attenuate the observed negative effect of faultline strength on group performance. However, the three-way-interaction of faultline strength, diversity beliefs, and task performance was statistically significant: Groups with pro-diversity beliefs working under weaker faultlines profited from task motivation, as did groups with pro-diversity beliefs that worked under stronger faultlines. Groups with pro-similarity beliefs that worked under a strong faultline also profited from task motivation. These observed effects on task performance were not mediated by information elaboration, which did explain a significant amount of variance of group performance. Task motivation can attenuate the negative effects of diversity faultlines on group performance, if the group’s diversity beliefs match its level of actual diversity. Diversity beliefs alone can be insufficient for bridging diversity faultlines. Future studies should examine other mediators of diversity on group performance besides information elaboration. In organizational practice, interventions targeting diversity beliefs should also target task motivation.

Fit for performance? Diversity belief fit and age-diverse team performance

STAMOV-ROSSNAGEL, C. (Jacobs University Bremen)

Age-diverse work teams might show performance superior to more heterogeneous teams given a larger pool of knowledge resources the former have available. However, age-diverse teams may also experience higher levels of interpersonal conflict that lower cooperation and counter the beneficial knowledge resources effect. Recent research has therefore focused on identifying moderators of the age diversity-performance relationship. From this research, it appears that diversity mindsets building on group members’ beliefs about and understanding of the effects of team age diversity might be such a moderator. Relatively little research has yet addressed the role of supervisors’ mindsets. In the present study, I therefore looked at the relationship between supervisors’ diversity mindsets and team performance. In an on-line survey, 258 workers (18-65 years old) from 44 teams of a company in the manufacturing sector and their supervisors rated leader-member exchange, the quality of interpersonal relationships, their diversity beliefs, and aspects of contextual and core task performance. Supervisors’ diversity beliefs were positively associated with leader-member exchange (LMX) initiated by supervisors. Differential effects of LMX emerged, however, depending on the type of fit between supervisors’ and team’s diversity beliefs. Positive supervisor beliefs only went with lower levels of relational conflict and higher performance if teams held positive diversity beliefs. Also, supervisors’ negative diversity beliefs were partly buffered by positive team diversity beliefs, whilst negative team beliefs were associated with lower performance regardless of supervisors’ beliefs. Consistent with previous research, it appears that diversity beliefs exert a substantial influence on the relationship between age diversity and team performance. More specifically, the fit between team’s and supervisors’ beliefs is of importance, as different types of fit produce different performance outcomes. Most importantly, equipping supervisors with positive beliefs might not be sufficient to overcome negative effects of age diversity as negative beliefs on the team level might cancel the effects of supervisors’ beliefs. Further research in this direction might help conceptualise age diversity trainings.

Driver stress and fatigue: From theory to intervention

Chair(s): MATTHEWS, G. (University of Cincinnati)
Discussant(s): SUMMALA, H. (University of Helsinki)

This symposium addresses recent developments in psychological understanding of driver stress and fatigue, and their implications for safety interventions. A theme of the symposium is that both stress and fatigue are multi-faceted constructs. Thus, a detailed theoretical understanding of these psychophysiological states is needed to support practical countermeasures. The first presentation, by Ann Williamson, provides an overview review of recent research on fatigue and performance. Although the adverse impact of fatigue on safety is widely accepted, a number of research issues remain to be resolved. Key issues are the lack of detailed understanding of fatigue effects, the need to discriminate different causes of fatigue, the role of individual differences, and the problems of transitioning simulator-based research into the real world. Next, Gerald Matthews et al. report on a study investigating the interplay between fatigue, stress and vehicle automation, in which the opportunity to use automation was manipulated. Results are consistent with previous findings suggest that automation may actually exacerbate fatigue, and alternative approaches to intervention that enhance driver task engagement may be needed. Simon Smith addresses perhaps the most dangerous manifestation of fatigue, sleepiness during driving. Fatigued drivers are often advised to rest, but there has been little research in support of more specific recommendations. A simulator study showed that a nap break was more effective in countering sleepiness than an active break. Benefits were evident in EEG and subjective measures, and in a behavioral measure of hazard perception. In the final presentation, Dwight Hennessy describes a study of the relationship between trait driver stress and preferences for “personal space” around the driver’s vehicles. It was found that stress relates to a greater space preference, especially in congested conditions, and in older drivers. This finding is interpreted in terms of needs for a safety buffer around the vehicle, rather than a need for perceived control. Heikki Summala will act as discussant. Learning objectives for the symposium include elucidating the role of psychological theory in supporting practical safety interventions, highlighting recent empirical findings on driver stress and fatigue, and comparing different methods for evaluation of driver competence and safety.

Fatigue and performance effects: What do we know and what do we need to know?

WILLIAMSON, A. (University of New South Wales)

This paper presents a review of current knowledge of fatigue effects on driver performance. Fatigue is identified as a serious problem for safe and efficient performance in many settings, but especially transportation. The main object of our concern about fatigue is the evidence that it has adverse effects on safety. For example, higher fatigue has been linked with increased crashes on the road and especially crashes with higher severity, resulting in deaths. Underlying these adverse safety outcomes are fatigue-related changes in performance. Understanding these changes is a key to preventing the harmful effects of fatigue. Unfortunately, our knowledge of the effects of fatigue is lacking in a number of notable areas and this includes having a clear view of the nature and range of performance effects of fatigue. This paper will summarise current knowledge of the effects of fatigue on performance, and focuses on some of the areas of research need. First, there is little consensus on the actual effects of fatigue on performance. Are some performance functions more affected than others? For example, there is debate on whether fatigue affects simple or more complex functions. Second, there has been no review of different causes of fatigue: whether fatigue that is sleep-related, time of day related or task related, produces similar effects on performance and whether and how these different causes interact to affect performance. Third, individual differences in the effects of fatigue
are clearly important and there is evidence that they account for a large amount of variability in performance effects, but is this the most important issue and in any case, does it signify temporary individual state or a more trait-related phenomenon? Finally, much of the research on the effects of fatigue on performance involves laboratory or simulator studies where the implications of poor performance are not so dire so the effort directed to the task simply will not be the same as in real world conditions. Unfortunately, there have been few attempts to link laboratory and simulator evidence to the effects on real-world performance.

Fatigue, stress and the automated vehicle

MATTHEWS, G. (University of Cincinnati),
NEUBAUER, C. (University of Cincinnati),
LANGHEIM, L. K. (University of Cincinnati), SAXBY, D. J. (University of Cincinnati)

Technological advances are increasingly supporting automation of vehicle operation, but the impact of automation on the fatigued and/or stressed driver has not been adequately explored. Previous studies in our driving simulator lab suggest two relevant conclusions. First, a study of stress showed that automation reduced workload but not distress induced by threats to vehicle control. Second, fatigue responses take different forms, and ‘passive fatigue’ induced by prolonged monotony appears to be especially dangerous. Automation may induce passive fatigue, leading to loss of alertness when the driver must resume full control. This study aimed to extend these previous findings by investigating whether the choice of using automation or not is related to the driver’s state of fatigue. 190 drivers (mean age: 20.2) participated in a simulated drive lasting 35 minutes, which was configured to induce fatigue rapidly. Half the sample were given the option of assigning vehicle operation to an automated system, for five min intervals, whereas the remainder drove normally. In the last five minutes, all participants drove normally, and were required to react to an emergency event, a vehicle pulling out unexpectedly in front of the driver.

Various scales were employed to assess the driver’s personality, and states of stress and fatigue before and during the drive. The study largely replicated previous findings that automation may accentuate subjective fatigue symptoms and reduce alertness to traffic events. It was found also that having the choice available tended to elevate fatigue and stress, and that pre-drive fatigue was associated with using automation, when permitted. Systematic individual differences in fatigue response were also observed. Findings add to concerns about providing automation to fatigued drivers. Data suggest a possible vicious cycle whereby fatigue encourages use of automation, which in turn exacerbates fatigue, distress and loss of alertness. Automation may encourage the reactive, effort-minimizing strategies typically adopted by fatigued drivers, lowering driver safety. Designers of in-vehicle systems need to address how to maintain driver engagement and active regulation of personal safety.

The effect of sleepiness on hazard perception skill when driving

SMITH, S. (Queensland University of Technology)

Sleepiness when driving is a major contributor to road crashes, with a high fatality and injury cost. We have shown previously that sleepiness impacts on hazard perception latency, a critical driving skill. Having a nap is one potential countermeasure to sleepiness. Further, ‘taking a break’ after two hours of driving has become a public policy strategy to reduce sleepiness-related crash risk. The benefits for hazard perception performance of either a nap opportunity or a break have not been demonstrated. Twenty young-adult drivers completed a three-hour simulated drive on a hazard perception task. They did this on two occasions, one week apart. The test sessions began either at 9am or at 1pm (fixed within individual), with all participants arising at 5am on the test day. After 2 hours on the task, they had either a nap opportunity (25 minutes in total) or an ‘active break’ opportunity (that included a 10-minute standard walk test). The order of the two
conditions was counterbalanced across the participants. Participants then completed the third hour on the task. Sleepiness was assessed with EEG by standard criteria and by self-report on the Karolinska Sleepiness Scale. The primary dependent variable was mean hazard perception latency during each hour on the task. Sleepiness increased across the initial two-hour simulated drive. Both the nap opportunity and the ‘active break’ resulted in decreased sleepiness during the third hour of driving when compared to the second hour of driving. The reduction in sleepiness (by both EEG power spectrum criteria and on self-report) was significantly greater after the nap opportunity. There was substantial inter-individual variation in sleepiness, capacity to nap, and change in sleepiness. A nap break appears to have greater benefit for reducing sleepiness, and improving hazard perception latency, during a sustained drive than does a break without a nap. It remains possible that an active break could reduce other aspects of ‘fatigue’ that can occur during longer drives. The capacity for individual drivers to take a nap when sleepy, and potential strategies to improve this capacity, needs to be further investigated.

Keywords: sleepiness, road crashes, hazard perception, fatigue

Drivers’ space preferences: Effects of stress proneness, age and congestion

HENNESSY, D. (Buffalo State College)

More than 20 years ago, Marsh and Collett argued that personal space extends beyond the physical boundary of the vehicle, which can impact on the nature and outcome of interactions with other drivers. Personal space “preference” may be manifested as a desire to have other vehicles remain at a distance from the drivers’ own vehicle. The aim of the present study was to examine the possibility that drivers develop a preference for a degree of “driver space” around their vehicles and that this is related to a trait of driver stress susceptibility. A simulation method was used to subjectively measure space preference in front of and behind the vehicle. Using a paper and pencil simulation (a vehicle was shown from an aerial perspective in a 2 lane roadway), participants were asked to indicate how far from their vehicle they generally prefer other vehicles (in front and behind) in either low or high congestion conditions (using random assignment for congestion condition). They also provided trait stress, desire for control, and demographic information through self-report questionnaires. The size of driver space preference was measured as the distance indicated by the participants from the front and rear of the simulated vehicle. Trait driver stress x age and trait driver stress x congestion level predicted driver space preference both in front of the behind the vehicle. Specifically, both older stress prone drivers and stress prone drivers in high congestion indicated greater space preference in front of and behind the vehicle. Desire for control did not predict driver space preference. Given the link with trait driver stress and the lack of relationship with desire for control, it appears that driver space preference is not as much a function of control as a safety buffer issue. Stress prone drivers may be focused more on others and perhaps prefer more buffer space to minimize stress/danger from other drivers.

Keywords: driving, stress, simulators, personal space
Drivers' hazard perception

Chair(s): VELOIKHOVSKY, B. (Dresden University of Technology)
Discussant(s): PRECE, M. (The University of Queensland)

An important cognitive component of driving is drivers’ hazard perception. Drivers’ hazard perception is the ability to anticipate potentially dangerous traffic situations. Hazard perception is the only driving-specific skill that has been found to relate to drivers’ crash risk across studies; drivers with poorer hazard perception have more crashes on average. Traffic psychologists have long been engaged in researching this important aspect of driver skill as an avenue for improving road safety. This Symposium will include speakers from 5 of the leading hazard perception research groups. As the speakers come from several countries (namely, the United Kingdom, Germany, Turkey, Japan, and Australia), the Symposium will cover research undertaken in a range of traffic environments. The speakers’ individual presentations will discuss: (1) which groups of drivers are at most risk for having poorer hazard perception (Paper 1: Novice drivers, Paper 4: Older drivers, Paper 5: Learner drivers); (2) what cognitive mechanisms underlie hazard perception (Paper 2: Spread of search, gaze duration; Paper 3: Eye movements to differentiate stress, fatigue and mode of visual attention); (3) how drivers appraise risks when driving (Paper 1: Self-reported perceived risk; Paper 2: Failure to correctly appraise risk; Paper 4: Classification of potential risk in driving scenes); (4) different approaches to assessing hazard perception skill (Paper 1: Videos of real driving scenes and self-assessment; Paper 2: Videos of real driving scenes and eye tracking; Paper 3: virtual reality driving simulator, dual-task paradigm, and eye tracking; Paper 4: On-road driving test, driver head movements, and videos of real driving scenes; Paper 5: Videos of real driving scenes). Attendees at this symposium will gain a broad overview of current research in hazard perception, with specific attention to the four themes presented above.

Discriminating novice and experienced drivers using actual driving hazard videos in specific risk domains

BERFU, A. (Middle East Technical University)

Novice drivers are particularly vulnerable to road crashes because of their poor hazard perception skills (HPS). The type of hazards drivers are exposed to may change depending on a number of factors, such as road conditions, and novices have heightened vulnerabilities to specific hazards, such as the ones occurring in a distance. Therefore, assessment of HPS in specific hazard domains is critical for effective training. We aimed to compare novice and experienced drivers in four domains: moving hazards joining from the left and right sides, hazards in the opposite and own lanes, using moving hazard scenes from actual traffic environment. We also investigated if self-reported HPS and driving skills predict video-based hazard perception latencies in these domains. 185 Turkish drivers were administered video-based real-life hazard perception test developed by researchers, and short measures of self-reported HPS and driving skills. Results revealed that novice drivers performed significantly worse than experienced drivers in hazards especially occurring in the right side of the road and opposite lane, but not in the those occurring in the own lane, after controlling for age. The pattern of the correlations between self-reported HPS and video-based HP latencies in four hazard domains yielded mixed results suggesting that self-reported assessment do not have an accurate basis in predicting HP latencies, especially for experienced drivers. Previous findings suggested that novice drivers have undeveloped scanning strategies and they fail to search for the sides of the road, especially when the hazard is developing from the left. Our results were consistent with the earlier findings in terms of the hazards occurring in the opposite lane. However, inconsistent with the earlier findings, right-side hazards were more dangerous for Turkish novices. This study suggests that along with poor scanning strategies, low levels of perceived risk is also crucial for labelling hazardous situations, and we predict that
opposite lane and right side hazards were more underestimated by novices.

Why do car drivers pull out in front of motorcyclists? Using hazard perception clips to assess whether car drivers look at, perceive and correctly appraise approaching motorcycles at t-junctions

THÖRNELL, E. (The University of Nottingham)

The primary cause of car-motorcycle collisions in the UK is a car pulling out of a side road onto a main carriageway in front of an approaching motorcyclist with right-of-way. Do these errors occur due to a failure to look at the motorcycle, a failure to process the motorcycle, or a failure to correctly appraise the risk presented by the approaching motorcycle? It is our aim to assess the relative contributions of these 3 potential causes in such scenarios. Hazard perception clips representing nearly 180° of forward view were recorded from a moving vehicle and edited with mirror information inset. These clips were presented to three groups of participants (novice drivers, experienced drivers and dual drivers who both drive and ride motorcycles) across three large screens. Participants undertook a combined hazard perception task and a sanctioning manoeuvres task, where the latter required participants to press a button when they thought it was safe to pull out a t-junction. T-junction clips were presented with either an approaching motorcycle, an approaching car, or without a conflicting vehicle. Participants’ eye movements demonstrated group differences in the spread of search on approach to the junction. Current analyses will also determine whether some participants were faster than others to spot approaching vehicles, and how this relates to their decision times to sanction the manoeuvre. Time to fixate the approaching vehicle relates to whether participants look, the subsequent gaze durations on target indicate whether the approaching vehicle was then perceived, while the button response to pull out reflects their appraisal of the risk. Crucially we will be able to say whether these behaviours differ for approaching cars and motorcyclists. Initial results suggest differences in the way drivers scan junctions, while subsequent results should identify more precisely where the driver’s behaviour breaks down with an approaching motorcycle. On the basis of these results we will propose training interventions for drivers.

Keywords: car-motorcycle collisions, hazard perception, eye movement, group differences, risk

Hazard perception and mental workload in simulated driving: From eye movement analysis to neurocognitive mechanisms

VELICHKOVSKY, B. (Dresden University of Technology)

Experts in human factors engineering and applied cognitive research are in search for a reliable methodology for an on-line assessment of attentional state of persons working in hazardous environments. We present data from an ongoing research project on the cognitive, emotional and neuropsychological bases of human risk behaviour. The main aim of this project is to build a model of risk behaviour in hazardous conditions, so that we will be able to predict decisions made in the face of uncertainty and risk. The objective of the present study was to look for individual differences in hazard perception during a static driving simulation and their relationship with driver functional states as related, on the one hand, to fatigue and to different modes of attention, on the other. Participants were tested in the SIRCA static driving simulator and behavioural measures were obtained during different potential hazard situations applying a singular and a dual task paradigm. A mental workload test was administered as a subjective rating of driver state. Eye movement parameters were measured using Eye Link II (500 Hz) video-based eye tracking system. The results show that the analysis of eye movements, and in particular the temporal aspects of saccades and fixations, can provide rich information about driver’s attention and the course of behaviour in hazardous situations. In particular, eye movement data do differentiate stress, fatigue and mode of visual attention. Based on these findings and earlier results
related to diagnostics of different modes of visual attention (ambient vs. focal – see Velichkovsky et al., 2002, 2005), we are now trying to develop an ‘early fatigue-and-distraction warning system’ in order to reduce the risk of accidents by the fast assessment of driver’s functional state in real traffic conditions. In a more general vein, we plan to assess the possibility of generalization of this approach to other hazardous situations and professions.

Investigation of elderly drivers’ hazard perception and driving performance

RENGE, K. (Tezukayama University)

The present study focused on the relationship between elderly drivers’ skill for perceiving traffic hazards and their driving performance. The investigation was conducted in three driving schools in Japan. Participants totalled 95 drivers (mean age of 71.7 years, 68 males and 27 females), who were divided into younger-elderly (from 65 to 70 years old), middle-elderly (from 70 to 75 years old), and senior-elderly (over 75 years old) groups. The participants completed a driving circuit and then a hazard perception test. The frequencies of drivers’ head movements were counted as a measure of drivers’ searching behaviour. The fifteen traffic scenes and one training scene were videotaped by a high-definition camera (Victor JY-HD10). After viewing each scene, the participants answered questions about possible hazards in each scene. The hazards were divided into three types: obvious hazards (OH), potential hazards (PH), and hazards relating to prediction of other road users’ behaviour (BH). A total of 57 hazards were included in the test, of which 12 were classified as OH, 28 were PH, and 17 were BH. Hazard perception scores demonstrated a significant effect of age group ($p < .05$). The senior-elderly group had lower scores than other two age groups. The main effect was especially shown for potential hazards ($p < .01$). The significant relationships were found between frequencies of head movements and hazard perception scores ($r = .425, p < .01$). Senior-elderly drivers could have deficits in perceiving potential hazards such as crossing cars, bicyclists and pedestrians from dead zones of roads. The participants with lower hazard perception scores had lower driving performance (fewer searching head movements), which means that the participants who do not understand the importance of potential hazards could show less searching behaviour on intersections.

Keywords: elderly, hazard perception, driving performance, head movements

The development and validation of a hazard perception test for use in driver licensing

WETTEN, M. (The University of Queensland)

Drivers’ hazard perception skill refers to a driver’s ability to identify dangerous situations on the road ahead. Designing a test that is able to distinguish between drivers of different levels of hazard perception ability is not a trivial matter, as demonstrated by a number of tests that have failed to detect differences between high risk (young novice) and low risk (older experienced) driver groups. Hazard perception tests are currently in use in a number of countries to assess drivers for licensing purposes though some have low reliability as measures of hazard perception skill. The pilot study and main study in this paper detail the development of a new hazard perception test used for driver licensing purposes in Queensland, Australia. In the pilot study, licensed drivers with English as a second language were assessed on their comprehension of the video-based instructions for the Queensland Transport Hazard Perception Test. Drivers completed two response time measures, were shown the test instructions, then asked to complete a shortened version of the Queensland Transport Hazard Perception Test. Drivers’ understanding of the instructions was then assessed and three standardized measures of English comprehension were administered. In the main study, a learner driver group and experienced driver group completed two response time measures followed by the Queensland Hazard Perception Test. The pilot study results showed that the video-based
Drugs, fatigue and driving: assessing risk and developing new methods for detecting driver impairment

Chair(s): STOUGH, C. (Brain Sciences Institute, Swinburne University)

Discussant(s): SWANN, P. (Vicroads/ Brain Sciences Institute, Swinburne University)

Traffic accidents are the single largest cause of deaths by injury worldwide and around 20% of traffic accidents result from driver sleepiness and falling asleep at the wheel. Increases in shift working and trends for reduced sleep length are increasing risk factors for these sleep related accidents, with the young and truck drivers representing particularly vulnerable groups. Drivers are relatively poor predictors of their imminent sleep onset indicating a need for driver warning systems, but effective commercial systems are still some years away. Sleep related vehicle accidents will be reviewed together with potential countermeasures. Research studies will be presented leading to recent developments in providing effective warning systems and countermeasures. Our laboratory simulator studies have shown the impact of sleep loss on performance, with night driving showing impairment that can be worse than driving with alcohol levels above the UK legal limit (0.08 g/dL BAC). A series of research studies has developed a method of categorising driver alertness and sleep status based on psychophysiological measures. The initial system involved ambulatory recording of psychophysiological measures including electroencephalogram (EEG), electrooculogram (EOG) and electromyogram (EMG) measures that provides a way of categorising waking arousal levels from alert to sleep onset and is continuous with standard polysomnographic (PSG) sleep recording. The system has been tested in simulator, controlled track and road driving environments which have demonstrated the sensitivity and reliability of the method. Recent developments have included neural
network and other computer-based automated analysis approaches with a view to providing real-time monitoring and warning systems. Arousal status is determined using simple mastoid placement of EEG electrodes with a view to developing a practical and simple device for monitoring driver sleepiness (for example, incorporated into a pair of glasses or Bluetooth headset). Future steps are to provide a system based on an inbuilt vehicle computer to monitor alertness and other driving parameters. Each driver will have a ‘smart card’ that holds a unique driver ‘fingerprint’, including EEG, associated with their normal alert driving and arousal profile. The system will incorporate a warning system to help prevent sleep related accidents.

---

**Early intervention and co-morbidity – How do we intervene early with young people presenting with comorbid mental health and alcohol and other drug problems?**

Chair(s): RICKWOOD, D. (headspace ACT; University of Canberra)

This symposium considers the issue of how to intervene early with young people presenting with comorbid alcohol and other drug and mental health problems. Intervening early to treat young people with mental health problems, particularly when comorbid with alcohol and other drug problems, is a major focus of current Australian mental health policy. This is in response to recognition of the high level of mental health problems in adolescents and youth and the urgent need to provide early treatment to prevent the development of long-term mental disorders. The learning outcomes for attendees of this symposium are that they will develop: an understanding that the major well-established methods of treatment for alcohol and other drug problems and mental health problems are generally inappropriate in an early intervention context; that service providers are unsure of how to identify and respond to early presentations involving comorbidity; that cannabis, amphetamine-type substances, and alcohol are the main substances of concern for young people presenting early with mental health problems; and that new ways of working effectively with young people around these issues are being developed across Australia, through adapting traditional approaches and using brief interventions and holistic and targeted early treatment approaches.
Early intervention for young people with comorbid mental health and alcohol and other drug problems

RICKWOOD, D. (headspace ACT; University of Canberra), KELLY, L. (headspace ACT)

The established methods of treatment for alcohol and other drug problems (AOD) may not be appropriate in an early intervention context, and in the context of co-occurring mental health problems, particularly for young people. The lack of knowledge in this field had been acknowledged by the Australian Psychological Society, noting that models of early intervention for young people with mental health and AOD problems are not well developed, yet essential to the work of headspace and other innovations in youth mental health service provision. This paper presents the findings of a study investigating the types of therapeutic interventions that are being implemented to intervene early for AOD and mental health problems for youth and adolescents at headspace ACT and other services that intervene early with youth experiencing these problems. Service providers from a range of backgrounds, including youth work and clinical psychology, from headspace ACT and similar services were interviewed to determine the types of interventions they were using with young people presenting with comorbid AOD and mental health problems, the perceived usefulness of these interventions, and the gaps they identified in the knowledge and practice base in this area. The interviews identified a lack of clear understanding of what comprised early intervention for AOD use and that many current therapeutic approaches were inappropriate for experimental and emerging AOD problems in young people. Clear differences were evident in the types of approaches used by service providers with different training backgrounds. However, clear trends were evident in the needs of young people presenting with comorbidity and what were perceived as potentially the most effective models of early intervention. The outcomes of this study identify major gaps in the evidence base regarding effective early intervention for young people presenting with comorbidity, and also indicate future directions to improve our understanding of the best ways to intervene early in harmful alcohol and other drug use for young people with comorbid mental health problems.

Brief interventions for young people with comorbid cannabis and mental health concerns

HOWARD, J. (National Cannabis Prevention and Information Centre, NDARC, UNSW), BATTISTI, R. A. (National Cannabis Prevention and Information Centre, NDARC, UNSW), COPELAND, J. (National Cannabis Prevention and Information Centre, NDARC, UNSW)

Brief interventions (BIs) have proved to be effective for some adults with problematic cannabis use and, more recently, with young people. However, many young people present to psychologists, other allied health professionals and medical practitioners with significant comorbidities – anxiety and depressive disorders and psychoses. For young people who have comorbid mental health difficulties, their cannabis use can impact on many aspects of their lives, including medication/treatment adherence, social and vocational efficacy, symptom severity and increased admissions to hospital. Given that young people may not readily engage with longer-term interventions, the development of effective brief interventions that address both substance use and mental health are necessary. This presentation will draw on recent work of the National Cannabis Prevention and Information Centre in developing both interventions to address the problematic cannabis use of young people and those with comorbidities. Some of this work has been in collaboration with Orygen Youth Health, a NCPIC partner, and the Brain and Mind Research Institute, and the latter will be used to illustrate the current research and preliminary outcomes. These brief interventions aim at increasing insight into how cannabis use affects the young person’s life, as well as enhancing motivation to change cannabis use behaviours, whether decreasing or cessation of use, or increasing control over
current levels of use. A further aim is to increase the young person’s willingness to discuss their cannabis use in the context of their mental health difficulties, particularly with health professionals from whom they receive ongoing care. Such interventions are therefore intended to serve as adjunct treatments to treatment as usual and are a conduit for discussion of cannabis use within regular sessions.

Keywords: brief interventions, cannabis use, young people, comorbidity

Can earlier intervention with amphetamine users prevent an escalation of use or relapse following treatment?

MAGOR-BLATCH, L. (University of Canberra), COPELAND, J. (National Cannabis Prevention and Information Centre, NDARC, UNSW), HOWARD, J. (National Cannabis Prevention and Information Centre, NDARC, UNSW), PITTS, J. A. (Odyssey House McGrath Foundation)

From 1993 to 2007, Australia saw a dramatic and significant increase in the use of Amphetamine-Type Stimulants (ATS), rising from 5.4% in 1993 to 9.1% of the Australian population in 2004. While the figure had decreased to 6.3% in 2007, this still represents 1.1 million Australians, or 7.7% of males (0.7 million) and 4.9% of females (0.4 million) over 14 years of age. Use of Ecstasy continued to increase over the whole reporting period, from 3.1% in 1993 to 8.9% in 2007. Increased use of ATS, and especially methamphetamine, is especially worrying since the use of ATS has been shown to have serious consequences for both physical and mental health, including increased heart rate, blood pressure, sleeplessness and reduced appetite. Mental health issues include aggression, violence and accidents resulting from unsafe behaviours, such as unsafe driving. In view of the high dependency properties of ATS and the physical and mental health effects which may result from its use, early intervention is suggested to prevent an escalation of use or relapse following a period of treatment. Extensive consultations in Australia and New Zealand during 2008-2009, revealed considerable concern by treatment agencies in accessing evidence-based treatment interventions to work with this population group. An ATS-specific treatment protocol resulted from these consultations and an outcome study is currently being conducted with 10 agencies across Australia. The treatment protocol is part of a comprehensive package including clinical assessment, together with tip sheets and worksheets to accompany the seven session intervention. It is aimed at increasing awareness of the effects of ATS use, assessing motivation for change and providing understanding of the mind-body connection and increased mental health problems, such as anxiety, which result from ATS use. This presentation will provide early information from the study. It is believed the intervention will have applicability as an early intervention with ATS users to prevent uptake with both outpatient and residential treatment populations.

Keywords: amphetamine-type stimulants, ecstasy, methamphetamine, early intervention, treatment agencies

Family therapy and cognitive-behavioral therapy for youth with depression, anxiety and substance disorders

BERTINO, M. (Deakin University), LEWIS, A. (Deakin University), TOUMBOUROU, J. (Deakin University), RICCIARDELLI, L. (Deakin University), KNIGHT, T. (Deakin University)

The aim of this study was to compare the efficacy of two psychological treatment modalities for youth depression, anxiety and comorbid AOD problems; to discuss issues of treatment design, training, recruitment, early intervention, and retention of participants as factors within a high quality clinical trial; and to introduce a new assessment protocol developed within the study. Preliminary data from a randomized controlled trial (RCT) will be presented, investigating the treatment efficacy of CBT and Family Therapy for youth with comorbid mental health and AOD problems. The RCT will recruit 100 families and is being conducted across service agencies and at Deakin University, in Melbourne and Geelong. Overall, there is some initial support for the use of these therapeutic modalities as early interventions for youth with comorbid mental health symptoms and AOD use. A review of the
current literature suggests a lack of RCTs to date, evaluating these approaches for youth and families. Discussion of the preliminary results from this RCT will be compared to existing findings. Discussion will focus on research design and time challenges of implementing high quality studies within existing adolescent service provision. CBT and Family Therapy appear to be efficacious treatments for youth mental health, but require more rigorous evaluation. Randomized controlled trials are desirable, yet difficult to implement with this population in ‘real world’ settings. A team of Deakin University researchers funded by beyond blue: the national depression initiative are currently implementing such a trial. Preliminary results are promising and innovative methods have been devised for assessing and engaging youth with comorbid mental health and AOD problems, and their families.

Keywords: family therapy, cognitive behavioural therapy, randomized controlled trial, comorbidity, alcohol and other drug problems

Economic decision making:
Rationality and moral aspects

Chair(s): TYSZKA, T. (Kozminski University)
Discussant(s): WEARING, A. J. (The University of Melbourne)

The focus of this symposium is understanding economic behavior and in particular the psychology of decision making. One of the most cited models in this field is prospect theory. The first two papers of the symposium deal with this theory. One of them concerns a possible extension of prospect theory from monetary to non-monetary dimensions like pain, waiting time, life expectancy, etc. Results indicate that the theory is also valid for these non-monetary dimensions. Another component of prospect theory, the probability weighting function, was studied in the second paper. Findings show that the shape of the probability weighting function is related to the format that probabilistic information is presented to the decision maker. There seems to be several advantages of using the experience-based format for communicating probabilistic information. Taken together, these results once again demonstrate theoretical advantages of prospect theory. The two other papers are focused on how people make economic decisions associated with moral questions. Studies seem to show that the strength of emotions evoked by violating a moral norm influences both moral judgments and moral choices. Under strong emotions moral judgments become consistent with deontological position, while under weaker moral emotions they become consistent with the consequentialist position. Stronger moral emotions evoked by a violation of a moral norm make people less sensitive to changes in the values of outcomes and probabilities of material consequences. The sensitivity to outcomes and probabilities of material consequences indicates the decision maker applies a compensatory decision rule, while insensitivity to these parameters indicates applying a non-compensatory decision rule. Moral aspects in economic decision making are also studied in experimental games. Research shows that very
young children (between three and four years) are generally selfish. However, older children (seven years old) develop a sense of what is fair and what is not. The results of the research presented here show that one of the determinants of fairness in children’s choices is the structure of the game. The three key learning objectives are: decision making, rationality, and moral aspects.

Keywords: prospect theory, money, economic behavior, psychophysical functions, non-monetary dimensions

Determinants of the probability weighting function

IDZIKOWSKA, K. (Kozmnski University)

According to prospect theory, when making decisions under risk people overweight low probability events and underweight high probability events. However, recent studies show that the probability weighting function may be dependent on the format of probabilistic information. The first purpose of this research was to find out whether the inverse S-shaped weighting function becomes more linear when the experience-based (instead of numerical) probability format is used. The second purpose of the study was to check whether the shape of the probability weighting function is related to other studies of frequency judgments which show that rare events are overestimated and frequent events are underestimated. The experiment was completed under two formats of probabilistic information. Under the so-called experience format, participants observed a series of outcomes and learned about the payoffs and chances of obtaining them. Then they judged the probability connected with a higher outcome of the lottery. Under the description format, participants just learned the numerical value of probability. In the last stage subjects in both groups chose certainty equivalents for the lotteries. The probability weighting function was estimated according to the CPT model and nonlinear least squares regression was performed. Additionally, the probability weighting function under experience condition was estimated with the respondents’ subjective probabilities instead of objective ones. The results confirm the hypothesis that probability weighting function is more linear under the experience than under the description-based probability format. For instance, the curvature parameter of the one-parameter probability weighting function under the experience condition equals 0.64, whereas under description it equals 0.51. Moreover, the parameter becomes even higher (0.76) when instead of objective, the judged probabilities are computed. It was
confirmed that that the probability weighting function depends on what format probabilistic information is used. Moreover, we found that overweighting low probabilities is mainly due to the misperception of probability.

**Keywords:** prospect theory, probability weighting function, probabilistic information, description-based probability, nonlinear least squares regression

### Moral emotions, moral judgments, and moral choices

MACKO, A. (Kozminski University)

The main purpose of the research was to discover how people make economic decisions associated with moral questions. First, we investigated whether people are consequentialists or deontologists in their moral judgments. In particular, the relationship between the strength of an affective reaction to the violation of moral norms and the nature of moral judgment was studied. Then, we focused on the relationship between the strength of an affective reaction to the violation of moral norms and how people resolve conflicts between moral sentiments and economic self-interest. In a series of experiments both process- and outcome-based methods were used. Respondents were presented with scenarios associated with moral questions and were asked to make (moral) judgments and choices. Respondents’ decision time and information searching were also registered. We found that people tend to take the deontological position when violating moral norms that evoke strong negative emotions, and they tend to take the consequentialist position when violating moral norms that evoke weaker negative emotions. We also found that people were more sensitive to changes in the values of outcomes and probabilities in those scenarios where violating moral norms evoked weaker negative emotions than in scenarios where violating moral norms evoked more intense negative emotions. An additional hypothesis is still being tested to find out if respondents in scenarios associated with stronger emotions are searching for less information about the choice situation than in scenarios associated with weaker emotions. Generally, our findings are consistent with the choice model where the decision maker first tests the strength of the moral sentiment associated with violating a given moral norm. When it is not very strong, trade-offs between moral and materialist consequences of the alternative are examined and the decision maker follows the compensatory decision rule. On the other hand, when the moral sentiment associated with violating a moral norm is strong and the material consequences do not produce a significant temptation, the lexicographic rule with primacy of moral values is applied.

### Selfish and social preferences in young children: The role of gender and socialization

MACKO, A. (Kozminski University)

The main goal of this research was to examine selfish and social preferences in two groups of children (6 and 11 years old). We also examined whether gender differences in social preferences found in adults are also present in choices made by children. The experimental procedure from the research by Fehr et al. (2008) was used. Each child participated in three sessions and was paired with another anonymous child. In treatment one (‘prosocial’), the participant could choose between two allocations: (1,1), i.e., one for the participant and one for the other child, and the allocation (1,0). In treatment two (‘envy’), the choice was made between the allocations (1,1) and (1,2). Finally, in treatment three (‘temptation’), participants made choices between the allocations (1,1) and (2,0). Children played for real payoffs (various stickers). The results obtained can be summarized in the following way: (1) Children tended to make fair choices in two of the three treatments, i.e., the ‘prosocial’ treatment and the ‘envy’ treatment. However, in the ‘temptation’ treatment, the choices became more unfair. (2) We found that children were aware they made unfair choices in the ‘temptation’ treatment. Most of them agreed that if they had made fairer choices in treatment three their partners would be happier. (3) Girls revealed more prosocial
preferences than boys but this difference disappeared in the ‘temptation’ treatment. (4) The recipient’s gender did not affect participants’ choices. This result is consistent with developmental psychology theories. (5) No differences were found between choices of children who attended or did not attend a pre-school playgroup. However, we found that socialization not associated with a pre-school playgroup did affect participants’ social preferences. Participants who had more frequent social contacts with other children made fairer choices than participants who met other children less often. The main results replicated the findings of the study by Fehr et al. (2008), showing a cross-cultural stability.

Ecstasy (MDMA): Psychological and health related implications for its users

Chair(s): MURPHY, P. (Edge Hill University)
Discussant(s): SCHOLEY, A. (Swinburne University)

This symposium will present findings concerning the implications for psychological functioning and health following the use of the black market drug ‘ecstasy’, which contains the synthetic amphetamine derivative 3, 4-methylenedioxymethamphetamine (MDMA) as its defining psychoactive ingredient. MDMA is known to disrupt brain serotonergic functioning in humans, although the permanence or otherwise of such disruption remains a matter of debate and continuing research. Furthermore, ecstasy users have been reported to show impairments to psychological health and cognitive performance. In extreme but rare cases, psychotic episodes and death, respectively, have been reported as linked to ecstasy use. The popularity of ecstasy use in a number of countries makes research into its effects of great public importance. Paper One will present findings from the Australian Ecstasy and Related Drug Reporting System (EDRS) concerning the psychological well being of ecstasy users with regard to such things as mood stability and sleep patterns, and explore the relationship of ecstasy use and its effects to personality variables such as impulsivity. Physical health will also be examined. Paper Two will compare studies of the psychophysiological stimulation and mood enhancing effects associated with ecstasy use from laboratory and real world settings, respectively, in order to elaborate upon our understanding of the behavioural and environmental variables which may enhance the long-term harms associated with this drug. Paper Three will present preliminary findings from a systematic review of studies of visuospatial memory functioning in ecstasy users, highlighting some of the variables which may account for inconsistent findings in this field. Paper Four will present important new findings concerning MDMA related impairments...
in driving performance. The three key learning outcomes for those attending and participating in this symposium may be described as enhanced awareness and understanding of: 1) Ecstasy related harms, with particular regard to health, cognition, and driving performance; 2) The behavioural and environmental variables which may exacerbate ecstasy related harms; 3) The impact of ecstasy use on the executive processes of working memory as shown, for example, in visuospatial memory and driving performance.

The health and wellbeing of frequent ecstasy consumers in Australia

BRUNO, R. (University of Tasmania)

There has been an increase in the use of 'ecstasy' (3,4-methylenedioxymethamphetamine) in Australia in recent years, to the extent where almost one quarter of 20-29 year olds have tried the drug. Despite the high prevalence of use, there are relatively low numbers of presentations to health and drug treatment services relating to ecstasy use, and little available data on the health of ecstasy consumers. The Ecstasy and Related Drug Reporting System (EDRS) is a national monitoring system designed to identify emerging changes in patterns of ecstasy and 'club drug' use and in their associated drug markets. This presentation will describe the physical and psychological health of ecstasy consumers contributing to the EDRS and the factors associated with their involvement in risky health behaviours. Convenience samples of frequent (at least monthly) ecstasy consumers in each Australian capital city were interviewed in relation to drug use, health, and involvement in health-risk behaviours. Annual cross-sectional interviews have been conducted between 2003 and 2009, each comprising approximately 800 individuals, supplemented by examination of external population-level indicators of ecstasy use such as treatment presentations. While these frequent ecstasy consumers are generally well-functioning, there are subgroups engaging in riskier patterns of drug use and who experience health harms at greater rates. Psychological distress in these participants is elevated in comparison to the general population and is associated with use of ecstasy in binge patterns (extended periods of use without sleep) and use of other drugs such as cannabis. Dependence in relation to ecstasy and other psychostimulants is apparent in a notable minority. Involvement in risky health behaviours such as drug driving is associated with problematic drug use patterns, and also individual factors such as impulsive personality traits and perception of risk. Binge and high risk alcohol use has dramatically increased over time, which negatively contributes to health problems. Health harms are apparent in a notable proportion of these frequent ecstasy consumers. However, these are largely hidden as consumers are not presenting to traditional treatment services. Innovative health interventions are required to better engage and address the harms experienced by this population.

Keywords: ecstasy, ecstasy and related drug reporting system, risky health behaviours, Psychostimulants, drug treatment services

Real world versus laboratory studies of Ecstasy/MDMA users: the importance of total bio-energetic stress

PARROTT, A. (University of Swansea)

The recreational drug MDMA or 'Ecstasy' shows stimulant properties in the laboratory. However in real world studies of dance clubbers and ravers, MDMA can generate more extreme hyper-stimulation, which can occasionally prove life-threatening. The total 'bio-energetic stress' from this powerful stimulant drug, coupled with environmental stimulation from multiple sources, may provide the core integrative factor. Controlled doses of MDMA have been administered to human volunteers in a number of laboratory studies. Recreational Ecstasy/MDMA users have also been monitored in a number of real world studies. The findings from these studies will be summarized and reviewed. In each laboratory MDMA study, a well defined profile of psychophysiological stimulation has been described, although it is rarely extreme or disabling. In real world studies, the degree of psychobiological stimulation can be far more pronounced. For instance in the laboratory,
MDMA leads to a 150% increase in the stress neurohormone cortisol, whereas dance clubbers on-MDMA show an 800% acute increase in cortisol. In the laboratory, core body temperature can be increased by around +0.3°C to +0.6°C following moderate-high doses, whereas in real world studies of dance clubbers, core body temperature can be increased by +1.0°C or more. The mood effects of Ecstasy/MDMA are also generally much stronger in real world studies, than in the laboratory. This may reflect the combined effects of stimulant drug, prolonged physical exertion, and environmental factors such as noise and overcrowding. Elsewhere I have argued that Ecstasy/MDMA users may be enhancing the acute effects of this drug by taking it in the hot and crowded conditions. However, by increasing the bio-energetic stress of the organism, the longer-term neuropsychobiological consequences may also be increased. It is important to investigate the effects of recreational drugs, such as MDMA, in real world studies. The cumulative bio-energetic stress, from both drug and non-drug influences, may be the crucial factor for understanding any longer-term changes in neurobiological integrity and psychological health.

Keywords: ecstasy, mdma, recreational drugs, bio-energetic stress, psychophysiological stimulation

The effects of ‘ecstasy’ (MDMA) on visuospatial memory performance: Preliminary findings from a systematic review

MURPHY, P. (Edge Hill University)

To review findings from studies of the effects of ‘ecstasy’ (MDMA) consumption in humans on visuospatial memory performance. Such performance has been demonstrated to draw upon executive working memory resources. Initial searches of the Psychinfo and Medline databases using appropriate search terms yielded 140 studies. This was reduced to 39 studies for inclusion in the review by applying inclusion criteria requiring studies to have human participants, to be published in peer-reviewed journals in the English language, and to report new findings concerning ecstasy use and visuospatial memory performance. Review articles and dissertations were excluded. The majority of studies tested participants who were not under the drug’s influence when tested. Seven studies involved the laboratory-based administration of MDMA prior to testing, and one included measures taken after illegal consumption. Ecstasy related performance deficits were reported for both currently abstinent users, and those under the drug’s influence. The use of more than one visuospatial task and multiple task measures prevented a simple count of studies reporting deficits or not. Tests of visuospatial memory administered were assigned to two broad categories: those testing recall for specific spatial elements of stimuli, such as the order of sequentially highlighted computer generated grid squares (Type One tasks); and tests requiring the recognition or reproduction of visual patterns (Type Two tasks). For Type One tasks, ecstasy related deficits were more likely on tasks requiring additional processing beyond the basic requirements of acquisition, retention and retrieval (e.g. reporting the reverse of an observed sequence). No immediate explanation for inconsistent findings regarding performance deficits on Type Two tasks was apparent with regard to estimated ecstasy consumption or time since last use. With few exceptions, all studies took steps to minimise the impact of potential confounds, most notably the influence of other drugs used. There is evidence for ecstasy related impairment of visuospatial memory performance, although this may be linked to the total executive workload imposed by a task. Researchers should consider the type of executive processes recruited, and total workload, in administering visuospatial tasks, as an aid to reconciling inconsistent findings. The review continues.

Keywords: ecstasy, mdma, visuospatial memory, working memory, executive function

The effects of MDMA and methamphetamine on driving performance

STOUGH, C. (Swinburne University)

This study aimed to examine the relationship between positive drug tests and driving impairment after the consumption of
methamphetamine and MDMA. We tested 61 participants (29 female and 31 male) aged between 21 and 35 years ($M = 25.34$ $SD = 3.26$). All participants were in good health, had a valid full drivers license (no probationary or learner drivers) and were recreational drug users. The project consisted of three experimental sessions that involved the consumption of 100mg of MDMA, .42mg/kg Methamphetamine, and placebo. Each experimental session incorporated an acute testing phase at 3 hours post-drug administration as well as a follow up at 24 hours post-drug to assess any residual affects the drugs may have on performance. The 3 sessions were double blind, counter-balanced and placebo controlled. At three hours post drug administration participants drove for approximately 20 minutes through four different scenarios: freeway traffic day time driving, city traffic day time driving and then repeated during night time conditions. For this study, a subset of 33 variables was analysed, each reflecting an error that can occur during the driving tasks. A series of repeated measures ANOVAs were conducted to compare driving errors during the placebo, methamphetamine and MDMA conditions. Blood samples were taken before drug administration (to ensure participants were drug free at the time of testing), at 3 hours and at 24 hours, immediately before the driving task in each session. Performance on the following measures were significantly worse when under the influence of MDMA three hours post drug (when compared to placebo): Signal changes, dangerous action skidding, inappropriate braking, safe following distance, speed in the city and overall driving score. Performance on the stopping brake measure was significantly worse when under the influence of methamphetamine three hours post drug (when compared to placebo). Driving performance improved at 24 hours post-drug administration compared to 3 hrs in the MDMA and methamphetamine conditions. Driving performance is significantly impaired on a number of driving variables when intoxicated by MDMA. Less impairment was observed in the methamphetamine condition, this may be attributed to the stimulant effects of small doses of methamphetamine administered.

Keywords: methamphetamine, MDMA, driving impairment, driving performance, drug tests
Education and coping: Teaching coping skills in diverse educational contexts

Chair(s): FRYDENBERG, E. (University of Melbourne), ISRAELASHVILI, M. (Tel-Aviv University)

Discussant(s): YOUNG, R. (University of British Columbia)

The role and importance of teaching coping skills in promoting children's positive mental health has been highlighted in numerous educational and psychological studies. Currently, one of the major challenges is to find ways to teach coping skills to children of different developmental stages and/or who are living in various environments. This symposium will present several explorations of the relevance and utility of teaching coping skills to children of various ages. Several intervention programs in which current knowledge on teaching coping skills has been applied will be presented and their utility and limitations will be discussed. The presentations will address children of different ages, of different cultures (i.e., Australia and Israel), and within different contexts (e.g., sexual harassment, cyber-world). Participants in the symposium will be supplied with several take-home messages regarding the best ways to intervene in the pursuit of promoting children's coping skills. Moreover, some generalizations that emerge from the different applications of current knowledge on young people's coping skills will be offered. Finally, new perspectives on the scope and ways to promote children's coping skills will be outlined. This will be done both within each of the presentations, as well as in the discussant's reflections, that will conclude the symposium.

Coping competencies in the early years: Identifying the strategies that preschoolers use

FRYDENBERG, E. (University of Melbourne), DEANS, J. (University of Melbourne)

This study, the first of a three-phase exploration, sought to understand the coping actions of four to five year old children. In particular it sought to identify the ways in which children describe their coping and how parents' descriptions concur and amplify those of their children. The participants in the project were twenty children attending a three-day a week preschool program and their parents. The sample consisted of four to five year old (M = 4.6 years) inner-city Australian children, nine males and eleven females (n = 19) and their parents (n = 17). The 5-8 minute child interviews were used to identify the range of responses that children had available to them to describe their coping in particular situations. Questions 1-6 of the parent survey related specifically to Separation, Communicative Problem Solving, Independent Problem Solving, Social Skills, and Adaptability. In question 7 parents were provided with a list of 27 coping strategies and asked to rate whether their child used each strategy ‘Never, Sometimes, or A Lot’. Both the child and parent responses were grouped into Active, Passive and Relational coping. The twenty child interviews provided 36 different coping responses that were categorized as Active (n = 20), Passive (n = 7), and Relational (n = 9). The finer-grained groupings such as, ‘play’, ‘talk it through’, ‘say sorry’, ‘ask for help’ etc, kept close to the Adolescent Coping Scale groupings wherever possible. Overall, children spontaneously provided more coping strategies than those listed in the parent survey and children reported using more active coping than passive coping. In Phase 2, 46 four to five year old children were asked to describe their coping strategies when dealing with seven age-appropriate challenging situations. The results again indicated that preschoolers could articulate coping strategies that were then theoretically clustered into productive and non-productive coping styles. In Phase 3, parents and teachers completed 112 surveys for 46 children relating to their coping. Mothers reported more passive coping for their children than did the teachers. Overall there are indications that there are a wide range of coping strategies that young children commonly adopt that are not widely recognized in current literature. Parents'
perceptions of their child's coping vary from that of teachers and children themselves.

Keywords: coping, children, preschoolers, parents

Engagement in schooling: resources and coping

MCKENZIE, V. (University of Melbourne)

This study aimed to investigate coping and resilience in students who struggle to maintain their attendance in mainstream education due to difficulties in learning and behavior which require specialized interventions. These interventions had in common removal from a mainstream school for a specified number of weeks, with intensive work on a set of skills and attitudes. The outcomes of this approach in terms of resilience and coping scores were evaluated as indicators of positive aspects of this educational practice. The study used a mixed methods approach. Students, teachers and some parents were interviewed. All students completed a set of questionnaires at three points in their program – on entry to a specialized program, at the end of the program, and approximately 6 months later. Students utilizing this intervention demonstrated shifts in some aspects of resilience and reduced their non-productive coping. These changes were sustained over a period of six months post program. Many students did not return to their original school, but most successfully reconnected with the education system following a change of school. Students consistently articulated a greater motivation for improving their educational outcomes. The students tended to see themselves as resourced and coping across the data collection points, although their teachers rated them as lacking resources and demonstrating many difficulties. There were changes on student responses in mastery as an element of resilience, which supports the need for ensuring students have opportunities to express competence whether they are strong or weak academically. Non productive coping also declined over the measurement period. The cohort was consistently rated high on attention problems although this was not the original reason for referral, which points to the range of problems that were addressed in these programs. The teaching staff dealt with problems in learning alongside significant mental health issues, making programming a challenging process. Consequently, carefully structured research can be difficult when the programs tend to be customized to the particular group, and idiosyncratic to the specific teachers. Implications of the findings are discussed in relation to achievement and engagement in schooling, as well as programming for the vulnerable and under resourced.

Keywords: coping, students, school, engagement in schooling, educational outcomes

The dual relationship between the prevention of adolescent sexual harassment and coping skills acquisition

ISRAELASHVILI, M. (Tel-Aviv University), SHAMIR, M. (Tel-Aviv University)

The purpose of the current study was to explore the role of coping skills acquisition in the prevention of adolescents' sexual harassment. Namely, the study explored the extent to which coping skills shape perceptions of sexual harassment and/or are shaped by a change in such perceptions. In order to do so, an intervention program was constructed in which the following issues were discussed: gender stereotypes, knowledge on sexual assault, attitudes toward sexual assault (myths that support rape), empathy towards the victim, ways of coping with stress, seeking help, discovery of the secret (an assault), communication between the genders and summary of the program. A total of 29 boys and 42 girls (ages 14-15 years) learning in four 9th grades parallel classes participated in the study. Out of the four classes, two classes consisting of 34 students, served as the intervention group, and the other two classes served as the control group. The Pre-Post measurements included students’ level of knowledge about sexual harassment, students’ acceptance of gender stereotypes and myths related to sexual assault (known as rape myths), students’ ways of coping with stress, and students’ possible reactions to a hypothetical incident of sexual assault that happened to an acquaintance/friend. The study findings indicate that students in the intervention group expanded their actual
knowledge on sexual harassment, acquired less myths and stereotypes related to sexual harassment, and reported more productive coping with incidents of sexual assault. In addition, following the exposure to an intervention in the context of sexual harassment, male adolescents reported more use of both problem-focused and emotion-focused ways of coping in general. The main conclusion arising from this study is that a structured intervention program is an effective tool that contributes to, and brings about, positive changes in students' perceptions of sexual harassment. Moreover, it seems that though the intervention focused on sexual assault, its implications can be further generalized to adolescent's general coping strategies, especially among male adolescents. Implications for prevention of sexual harassment and the role of coping skill acquisition during adolescence will be discussed.

Teaching to cope productively: A cyber bullying intervention

LAM, C. (Hong Kong Society for The Protection of Children), FRYDENBERG, E. (University of Melbourne)

Whilst millions of adolescents are involved in online activities many have become victims of cyber harassment. To date, there is little research that has investigated the outcomes of teaching cyber safety and its relationship in increasing the resilience of adolescents in the Cyberworld. It is anticipated that those adolescents who are directly taught to cope productively will be less likely to suffer the short and long term adverse effects of bullying compared to those without these skills. It is believed that the teaching of online safety would also yield a similar positive outcome. This project investigates how a program teaching coping skills (Best of Coping Program) (BOC) and a program teaching cyber safety (Cyber Savvy Teens Program) (CST) can optimize adolescents' capacity to cope online. Thirty-three adolescents were divided into three groups: Control, BOC and CST. Participants completed a questionnaire on cyber knowledge and habits pre-program and completed the Adolescents Coping Scale, the Kessler Psychological Distress Scale pre- and post-program. Participants also completed a program evaluation form post-program. There was a significant improvement in emotional well-being (as measured in K-10) from pre- to post-program for both groups (BOC and CST group). Coping and emotional well-being produced marginal improvement pre- to post-program.

Qualitative data (i.e. open-ended questions in program evaluation forms) provided a link between the programs (both extended BOC program and CST program) and the changes in adolescents' thoughts, feelings and behaviors. This finding provides further evidence that pre-to post-program differences found in this study were linked to the program provided. Participants in both program groups demonstrated improvements in their overall mental health and in making better online choices post-program. The BOC program was found to be a better program than CST alone to improve general coping, whereas the CST program was better at tackling cyber specific issues. In summary, this result provided primary findings suggesting that the extended BOC program and CST program had improved adolescents’ ability to make safer online choices. Both programs are also effective in enhancing aspects of coping, emotional well-being and feelings in dealing with negative online events.

Keywords: adolescents, cyber harassment, cyber safety, coping
Education and training of psychologists

Chair(s): PANDEY, J. (Central University of Bihar)
Discussant(s): SILBEREISEN, R. K. (University of Jena)

This symposium is planned to highlight importance and progress of the IUPsyS Project on “Education and Training of Psychologists” with objective to review very broadly status of psychology education at different levels (High School, College/University), training (practical training and internship) and practice including accreditation process in different regions of the world. It may not be possible to cover all regions and all aspects of education and training. The presentations will identify strengths and weaknesses in psychology, education, training and practice in varied socio-cultural and economic contexts across the world. Evolution of norms leading to quality psychology education and training would facilitate development of psychological science capable to deliver best possible for the welfare of mankind and also to pursue high quality scientific research for its advancement. The example of status of Psychology in the South Asia will be discussed.

The EuroPsy standard of education and training in Europe

PANDEY, J. (Central University of Bihar)

EuroPsy is a European standard of education and training that enables professional psychologists to be recognized as having a European-level qualification in psychology. There were two stages in the development of EuroPsy. The first stage, which began in 1999, was EuroPsyT “A framework for education and training of psychologists in Europe” which was accepted by EFPA (the European Federation of Psychologists’ Associations) in 2001. This project analyzed the courses, required and elective, at the undergraduate and graduate levels in a number of European countries. The findings indicated strong similarities of the required courses at both levels, with variations in the elective courses according to the culture and interests of the countries. This project is similar to the proposed project of IUPsyS. The second stage was the development of EuroPsy, whose purpose was to set a quality benchmark of education and practice in psychology, and therefore to protect the public, and to improve mobility for psychologists among countries in Europe. It is based on a 5 year education and training in psychology, at least 3 years of bachelor level and 2 years of postgraduate level, and includes 1 year of supervised practice. The three broad professional contexts (and a fourth category for those who do not fit the others) are education, clinical & health, organization & work. It offers psychological associations a benchmark of quality of professional qualifications. EuroPsy was approved by EFPA in 2009, and is issued by EFPA through the National Accreditation Committees of 32 national psychological associations in Europe, representing approximately 180,000 psychologists.

Keywords: EuroPsy, education, training, Europe, professional qualifications

Education of psychologists in Eastern Europe and Russia

GEORGAS, J. (The University of Athens)

The system of psychological education in the countries of Eastern Europe was under a substantial pressure for modification since the political transformation of the 1980-1990s. The national systems of higher education made a more or less heavy departure from the Soviet model in the beginning of the 1990s (or were to be built completely a new in the newly emerging countries). Also, the advancing processes of globalization and changes in the global economic situation had forced many countries to be concerned with the modernization of national educational systems. For instance, many countries of Eastern Europe (including Russia) entered the Bologna process, accepting the obligation to switch to the two-stage educational system. Furthermore, after the fall of ideological constraints there were a constant increase in the demand for psychological services. However, in parts of East Europe psychology as a practically
relevant discipline was relatively less developed. Thus, the curricula of East European universities had to be changed accordingly, and quality-ensuring systems for psychological services (through accreditation and licensing) were to be created. East European countries have made different progress in resolving these issues, often taking different routes in re-shaping the national systems of psychologists’ education and training. In this presentation, the current practices of psychologists' education will be reviewed for several representative East European countries. An attempt will be made to identify similarities and differences between the approaches chosen by different countries, as well as the weaknesses and strengths of the approaches. Conclusions will be drawn about the plausibility of applying globally developed standards for psychological education in East European countries (with a special emphasis on respecting the specifics of national educational systems and the preservation of the identity of national psychologies).

Keywords: psychological education, higher education, Eastern Europe

Psychology education and training in Southern Africa

VELICHKOVSKY, B. B. (Moscow State University)

In Africa psychology education and training does not appear to have been benchmarked outside of English-speaking Southern African countries. For instance, Namibia, South Africa and Zimbabwe all have dispensations which require a minimum of a Masters level of training and where education standards are nationally determined. Furthermore these countries have national regulatory/licensing bodies, and legislation protects the title psychologist and defines psychological acts. This experience is different to many other African countries. Although most African universities are statutory creations, enjoy autonomy, and receive public funding, psychology tends to be a lower priority confronted as these institutions are with issues such as poverty, disease, natural disasters, and wars. The setting of education and training guidelines by the Union would thus assist many of these countries in attaining the necessary statutory protection for the title psychologist. This will in turn facilitate the development of the discipline, enhance its stature and visibility on the African continent, and increase its ability to assist underserved communities. The current state of psychology education and training in Southern Africa will be addressed within this context.

The education of psychologists in Southeast Asia: A preliminary report on the five original ASEAN countries

WATTS, A. D. (Entabeni Hospital)

Psychology is relatively young in the Southeast Asian Region, where most professional psychology organizations are younger than 50 years. As such, most of the features of the system of educating psychologists are still evolving within the individual countries, and convergences have yet to emerge within the region. For example, analysis of existing policy documents and accounts of existing practices indicate that there is still no consensus regarding what should be the minimum level of educational attainment of a psychologist (master’s or bachelor’s degree). The level of state regulation of the psychology degree programs also varies significantly across the region, and between state and private degree-granting institutions within the countries. Thus, although there seem to be similar curricular requirements, there is no guarantee of substantive equivalence among the seemingly similar requirements. However, one common feature of most curricular programs in psychology in the five original ASEAN countries is the emphasis on the more applied areas of psychology (counseling, counseling, industrial-organizational). So far, recognition of psychology degrees from other ASEAN countries has been minimal. These attempts highlight the need for greater convergence of the curricular requirements for the education of psychologists in the ASEAN, particularly as the ASEAN countries are committed to opening their professional labor markets to each other starting 2015. Other challenges related to a common set of educational requirements (e.g., different lengths of basic education cycle,
different higher education systems, etc.) are also discussed.

In search of a global reference frame for education and training in psychology

BERNARDO, A. B. I. (De La Salle University), GOH, C. L. (Help University College), NAIR, E. (Work & Health Psychologists), SUHAPTI, R. (Universitas Gadjah Mada)

Psychology as an academic discipline is undergoing change in various directions. On the one hand the theoretical profile becomes more complex due to the integration of other perspectives, such as the neurosciences but also the social sciences, and sometimes this is discussed as a paradigm change that endangers the coherence of the discipline. On the other hand new fields and modes of application emerge beyond the traditional domains of psychologists’ activities concerning work and health. Such developments require models for the education, training, and work of psychologists that go beyond past tradition. Whereas in some regions of the world curricular standards and professional profiles were developed and implemented, in other regions of the world this is not the case. Rather than simply taking over what worked for others, important questions of the adequacy of such references for psychology in these regions come up. After all academic curricula are known to reflect the codes and values of the dominant scientific view. Therefore one has to find a match between what is affordable for a country and what is needed in order to become a resource in the international discourse of psychology. Achieving this requires objective information about psychology education and training worldwide, followed by an attempt to filter out what needs to be shared by all. In order to implement such a model in the future, the value of psychology as a science and a field of application need to be communicated to policy makers, employers, and other stakeholders. It is the responsibility of an international learned society such as IUPsyS to initiate and moderate such a process.

Effects and effectiveness of interventions in environmental psychology

Chair(s): KRAEMER, S. M. (Eawag: Swiss Federal Institute of Aquatic Science and Technology)

Since it’s founding, environmental psychology has been concerned with eliciting or changing pro-environmental behaviour. To accomplish that, psychological interventions have been designed, implemented and tested. This symposium is presenting structured approaches to examine various intervention techniques using different models. When looking at interventions, two aspects are important for analysis. First of all, their effectiveness needs to be examined. That means, pre- and post-measures before and after interventions should be surveyed to receive a clear indication for the effectiveness of the intervention. The comparison of a group that receives an intervention with a group that does not, also gives a good indication for effectiveness. The effects of the interventions should be examined by analyzing which theory-based constructs are being changed and how they are changed through interventions. In a theory-based approach, the Transtheoretical Model is applied to solar water disinfection. Another presentation shows the effects of spoken prompts on plastic bag use implementing the dual motivation model. Persuasion as a theoretical framework was applied to study the effects of egoistic appeals on checking tires. One presentation shows how an educational program has been used to change environmental perception. The background here was the “Two Major Environmental Values” model. Finally, a conceptual model is presented that provides a theoretical framework to analyze behaviour change interventions. All presentations are examining different aspects of the effectiveness and the effects of interventions for behaviour change.

User types and interventions in the behavior change process of adopting a sustainable innovation in Zimbabwe

KRAEMER, S. M. (Eawag: Swiss Federal Institute of Aquatic Science and Technology)

The current research intends to show that the adoption of solar water disinfection (SODIS) underlies a behaviour change process, i.e. that user types can be found that match the stages of the Transtheoretical Model of Change (TTM). These user types shall be differentiated by several psychological factors derived from TTM. Additionally, different interventions shall be shown to affect various psychological factors, which are discriminance for the respective user type. Rules are set according to the TTM that aid in classifying user types. The developments of certain factors per user type are compared with the help of general linear models (GLM). Used psychological factors are need, attitude, intention and habit. GLMs also help to identify which interventions affect which factors (derived from the Theory of Planned Behaviour: attitude, subjective norm, perceived behavioural control, intention and habit). The following user types according to the TTM can be identified: Non-users (precontemplation), fluctuaters (contemplation), late beginners (preparation), irregular users (action), regular users (maintenance) and relapsers (relapse). These user types are found to be discriminated by different psychological factors: Need, attitude and intention differentiate between non-users and fluctuaters, intention between fluctuaters and late beginners, and habit between late beginners, irregular users, regular users and relapsers. Additionally, need distinguished between irregular and regular users. It can also be shown that different interventions have effects on different factors: promoters, prompts and public commitment affect attitude, subjective norm, behavioural control, intention and habit. Pass-on-tasks (promoters request people to pass on information to others) affect attitude, subjective norm and intention, whereas knowledge dissemination with dissonance arousal (promoters highlight the difference between target and actual behaviour) only affects attitude and perceived behavioural control. An implementation
intention contract showed to affect subjective norm, behavioural control, intention and habit. To identify user types according to a behaviour change theory helps to match interventions to the respective user types. Since different interventions affect factors that are differently successful according to the targeted user type, these findings are important for and will be applied to campaign planning. Identified factors can help to move people from one stage to the other.

The effect of prompt by bespeaking on pro-environmental behavior: an intervention study for reducing plastic bags at supermarkets

OHTOMO, S. (Konan Women’s University), OHNUMA, S. (Konan Women’s University)

This study implemented a field study to reduce plastic bags at supermarkets. The dual motivation model was examined with the intervention, which proposes that pro-environmental behaviors were determined by two motivations. The usage of plastic bags would be more affected by unintentional process than intentional process, if there is no intervention. However people would intend to refrain from using plastic bags, if they are given a cue from the cashier. This study examined the effects of the bespeaking as a kind of prompts for promoting pro-environmental behavior. We hypothesized that the bespeaking-prompt would reduce usage of plastic bag behavior by inducing an individual’s intentional motivation and inhibiting their unintentional motivation. A field study was implemented in supermarkets in Japan. In the first week, there was no intervention to set the baseline, i.e. shoppers are given free plastic bags from the cashier. In the second week, cashiers bespoke to shoppers whether they wanted plastic bags or not. The shoppers were asked to answer the questionnaire just after they went through the checkout counter. They could take the questionnaire home and send it back by mail. The number of respondents obtained were 448 in the control condition (the first week) and 435 in the bespeaking condition (the second week). The difference in attitude for using plastic bags between the two conditions was not found. However, the injunctive norm, perceived behavior control, and intentional motivation were higher in the bespeaking condition, while descriptive norm, hesitation, unintended motivation, and using plastic bags were higher in the control condition. Moreover, the effect of unintentional motivation on using plastic bags was stronger in the control condition. On the other hand, the effect of intentional motivation on the behavior was stronger in the bespeaking condition. The results suggested that the bespeaking activated a deliberative and conscious decision about using plastic bags, hence the intentional motivation was salient and unintentional motivation inhibited. This study succeeded in demonstrating the effect of the prompt by bespeaking and the usefulness of the dual motivation model of pro-environmental behavior.

Keywords: plastic bags, supermarkets, pro-environmental behaviour, bespeaking, motivation

When egoistic appeals backfire: persuading drivers to check their tires

BOLDERDIJK, S. W. (University of Groningen), STEG, L. (University of Groningen), GELLER, E. S. (Virginia Polytechnic), LEHMAN, P. K. (Virginia Polytechnic)

There are typically two ways via which marketers promote pro-environmental behavior. Biospheric appeals promote pro-environmental behavior via referring to the intrinsic value of nature and the environment: energy conservation should be pursued because it benefits the environment. Egoistic appeals, conversely, stress that acting pro-environmentally is in one’s self-interest: energy conservation should be pursued because it saves money. Environmental campaigns often opt for egoistic appeals, assuming that appealing to self-interest is necessary to achieve behavior change. However, drawing upon prior research, we reasoned that when promoting low-cost pro-environmental behaviors, biospheric appeals may actually be more effective than egoistic appeals. Our aim was to test this proposition. We tested the effects of biospheric and egoistic appeals on
tire pressure checking behavior, both in a survey study, as well as in two field experiments. In the field experiments, we presented different appeals to patrons of a local gas station. Student assistants recorded patrons’ tire pressure checking behavior. Results from two field experiments support the notion that biospheric appeals might be more effective in promoting low-cost pro-environmental behavior than egoistic appeals. Specifically, in Study One, we found that biospheric appeals are more effective in motivating drivers to get a tire pressure check than egoistic appeals. In Study Two, we found that egoistic appeals even de-motivate pro-environmental behavior. In a survey study, we tested whether Aronson’s interpretation of cognitive dissonance theory (1992) could account for the results: people might be motivated to act on biospheric appeals, and avoid acting on egoistic appeals in order to preserve a morally good sense of self. Biospheric appeals may be more effective in promoting low-cost pro-environmental behaviors than egoistic appeals. Implications for environmental campaigns are discussed.

Keywords: pro-environmental behaviour, energy conservation, biospheric appeals, egoistic appeals, environmental campaigns

Changing long-term adolescents’ environmental perception through short-term educational programs?

BOGNER, F. (University of Bayreuth), WISEMANN, M. (University of Bayreuth)

A questionnaire battery designed to measure the factors Utilization (U) and Preservation (P) in the field of adolescent environmental perception was applied within the context of an educational program within a National Park. The intervention lasted for one day or one week, both were monitored via pre- and post-testing. Maximum likelihood factor analysis confirmed the two hypothesized orthogonal factors U and P of the 2-MEV model (Two Major Environmental Values) as sets of related attitudes. Thus, all participants could be allocated with regard to their scores in U and P by assigning them to quadrants including P+, P-, U+ and U-. Consequently, due to the two test cycles changes within this allocation were monitored. The weeklong education program consisted of an extra-curricular unit in a field centre within a National Park. The program caused a shift within the scale of environmental perception, preferably occurring in the consistent direction of favoring nature and the environment. Scores on the higher-order factor of Preservation (P) increased, those on Utilization (U) decreased. Comparisons with the control group confirm the impact of the program. Differences between the pre-test scores of the control group and the treatment group were not significant; differences between the post-test scores were highly so. For both, the degree of change for the Preservation and Utilization scores to the pre-intervention scores, summarized as the regression line running through the cluster of points marking the position of each individual. In both cases, a clear regression downwards from left to right appears – the lower the pre-intervention score, the greater the degree of change. Both shifts within our pre- and post-tested variables are discussed in the context of three related studies using the same empirical survey instrument. (Bogner, 1998, 1999, 2002; Bogner & Wiseman, 2004). Particularly in the area of environmental education concern has always proceeded beyond the imparting of knowledge to changing adolescent attitudes, and even modifying their long term environmental behaviour. The 2-MEV model yielded the further advantage that intervention studies throughout the series are comparable, since the core of the instrument has remained constant.

Keywords: utilization, preservation, adolescent environmental perception, environmental education, environmental behaviour

Explaining effects and effectiveness of interventions in campaigns by applying a new behavior change model

MOSLER, H. J. (Eawag: Swiss Federal Institute of Aquatic Science and Technology)

The goal of this study is to review behavior change research on the basis of a new conceptual model about behavior change in populations aimed at campaigns. The model is based on Transtheoretical Model (Prochaska &
DiClemente, 1983), Theory of Diffusion of Innovations (Rogers 2003), Health Action Process Approach (Schwarzer, 2008), and Theory of Planned Behavior (Ajzen, 1991). The model is then used to analyze projects about campaigns which targeted to change behavior in populations. The conceptual model differentiates between five processes: attention and comprehension, persuasion, decision, implementation, and habituation processes. Each of these processes involve factors which require corresponding intervention techniques. The behavior changing techniques have to be combined with dissemination interventions to be influential in the whole target population and not only in single individuals or groups. The behavior change processes lead to behavioral determinants. These have to be favorable to the new behavior to generate the new habitual behavior, meaning that this behavior is performed constantly and nearly automatically when the corresponding situation arises. For the review, behavior change campaigns documented in research articles, project reports, and manuals are analyzed on the background of the conceptual model. If indicated, shortcomings and gaps are identified, which could have led to insufficient outcomes of the campaigns. Only very few projects are backed up with behavior change theory and very few determine which psychological factors they aimed to achieve behavior change. Further the analysis shows that many campaigns stop at the point when people show the targeted behavior the first few times but do not take into account that the behavior has to be implemented as a habit. Mostly, relapse prevention is not provided and dissemination strategies are not designed and applied in a well planed manner. Literature review reveals the necessity of theory based behavior change campaigns. It seems to be decisive for the success of campaigns to i) arrange dissemination strategies compatible with the applied behavior change techniques ii) include habit building techniques and iii) to implement relapse prevention strategies.

Keywords: behaviour change, campaigns, transtheoretical model of change, theory of diffusion of innovations, theory of planned behavior

**Electro-Mobility in megacities:**

**Will driver behavior or mobility patterns change?**

Chair(s): KREMS, J. (Chemnitz University of Technology)

Discussant(s): SYMMONS, M. (Monash University)

Today we have to face a decreasing accessibility of resources paired with a growing demand for them. Thus, the crucial challenge for the future will be to minimize energy consumption and to expand the usage of renewable energies. Striving for these goals also means organizing the increasing mobility in an environmentally sustainable manner. On the one hand people will have to adapt their driving behaviour in such a way that they contribute to minimize greenhouse gas emission even when driving conventional cars. On the other hand automakers raise their eco-credentials by putting in high effort on designing alternative drive concepts and bringing them on the market. Especially for metropolitan areas electric vehicles (EVs) are repeatedly discussed as an equivalent substitute for conventional internal combustion engines. Nevertheless the battery, the limited range and ecological issues still play a crucial role when discussing a possible market launch. Based on experience in several large scale field studies, the symposium will deal with important issues connected to the new technology. Also psychological methods to assess the potential and acceptance of electric mobility in everyday use will be focused. The main research questions addressed by the symposium are: 1) what expectations do drivers have concerning the new technology? 2) how important is the ecological benefit of an E-vehicle for the user? 3) how is the car used in everyday life? 4) what are the constraints for the infrastructure? The symposium will integrate results from four field studies that are currently conducted worldwide. These are the largest studies on electric vehicles done until now. Andreas Keinath will give results from a one-year study in Berlin with more than 100 drivers. Peter Cocron will also report results about driver
Are there differences in the mobility patterns due to BEV?

KEINATH, A. (BMW Group)

Battery electric vehicles (BEV) are gaining currently wide attention from media as well as from research. Nearly every OEM is now working on at least one BEV. BEVs are seen as one of the possible future markets in the automotive industry. Besides the ecological factors of a BEV and their economical importance it is even more surprising that until now there has been so little field data from customer research. Therefore in 2009 and 2010 BMW has started a field trial with its MINI E. This electric Mini is a conversion of a standard MINI with a 220 Nm torque, 0.14 kWh consumption and a nominal range of 240 km. In three countries BMW has issued the MINI E for 600 households in the US, 100 households in Germany and 40 (2x20 private) households together with 20 fleet vehicles in UK. All vehicles in Germany and UK have been equipped with data loggers to be able to compare objective field data how BEV are actually been used with subjective data coming from questionnaires and interviews reflecting users perception. Examples of data that have been logged by the vehicles are single trip lengths, daily driven km, status of the battery, frequency of charging as well as charging times. In addition to that, objective data has been recorded on how people used public infrastructure compared to private charging at their homes. This comprehensive objective database allows us to validate the subjective data gained through subjective methods. The main focus in our presentation will be the validation of concepts like range anxiety or the importance of public infrastructure while using BEV in cities like Berlin or L.A. We will also discuss the objective data from the MINI E compared with data from comparable but conventional cars. The results show that the BEV is already suited for daily use in big cities. Differences in the usage pattern of a BEV compared to other vehicles seem to be negligible. However, the results also point out possibilities for further development.

Expectances and experiences of drivers using an EV: Findings from a German field study

COCRON, P. (Chemnitz University of Technology)

Faced with growing CO2-emissions, considerable efforts are being made to establish alternative means of transport such as electric vehicles. Aim of the present field study was the development and application of psychologically founded methods to assess the acceptance and the suitability of EVs for everyday usage. Main focus of the research was put on the question how users evaluate restrictions such as the limited range of EVs and how users learn to adapt to the new technology during the course of the study. The study was conducted in the Berlin metropolitan area and is split into two periods of six months, each with a different sample of users (N = 40). The participants were interviewed before getting the car, after three months and when returning their vehicle after six months. The research package involved in-depth interviews, thinking aloud, questionnaires, travel and charging diaries and two experimental tasks. By applying such an extensive methodology even slight changes in attitudes e.g., towards the environment and changes in driving behavior can be reliably detected. The subjective data were supplemented by objective data from onboard data loggers which continuously record variables such as speed, acceleration and trip length. When interviewed before the delivery of the car, participants report positive attitudes towards e-mobility, but considerable concerns about the limited range of the car (150 - 200 km). After three months almost all the participants report that the range of the EV is suitable for their daily routes. Additional results from the travel diaries indicate that only a minor percentage of trips cannot be
made with an EV due to EV-specific restrictions such as range and low battery status. Regarding technical innovations such as regenerative braking, users report to have quickly adapted to those. The results indicate that electric vehicles are suitable for the application in metropolitan areas. Changes to the vehicle-driver-system such as regenerative braking are accepted but adaptation processes might occur. Barriers for overall acceptance appear to be psychologically founded and should be addressed accordingly.

Keywords: transport, electric vehicles, environment, driving behaviour, vehicle-driver-system

Driving climate change; a case study of electric vehicle drivers in Los Angeles and New York

TURRENTINE, T. (University of California Davis)

One of the more difficult technical challenges related to climate risk is reductions in greenhouse gases in the personal vehicle sector. Personal vehicles are both important practical and very public symbols to drivers of status and other aspects of identity. Market growth in some developing nations like China has been double digit for a decade. The world fleet of vehicles is expected to grow to almost 2 billion vehicles by 2050. This sector is completely reliant on internal combustion gasoline and diesel fueled vehicles, which create a quarter of anthropocentric sources of greenhouse gases. One pathway to reducing greenhouse gases is a transition to electric vehicles (EVs) and renewable electricity. However, EVs have technical limits and advantages for consumers, making their success in the market uncertain. EVs rely on chemical batteries, which are slow to recharge, expensive and store less energy. Depending on size and design, electric vehicles have 60 to 200 kilometers of range before they must be recharged. Then depending on types of recharge equipment and battery size, a fully depleted battery can take many hours to minutes to charge. And yet, electric vehicles have unique refueling systems; drive feel and low emissions capabilities, characteristics that could have appeal to buyers. Thus, the transition to electric vehicle is not a simple market substitution, but could require certain adaptations, new values, changes in beliefs and lifestyle routines. We report here on results of a one-year study of over 500 drivers of BMW electric vehicles in a unique demonstration project spanning Los Angeles, New York and Berlin between June 2009 and June 2010. Drivers answered multiple surveys, kept diaries, and a subset of 80 drivers was interviewed in detail about their new use patterns and reactions to the vehicles. In particular we rely upon the use of “narratives” to explore consumers’ explanations of their lifestyle choices and adaptations. We report here on three essential areas of behavior 1) adaptations to the limited range and long recharge times of electric vehicles, 2) reactions to the driver interfaces, and 3) beliefs about the social and environmental benefits of the electric vehicles.

Keywords: environment, lifestyle, electric vehicles, greenhouse gases, renewable electricity

Driving into the future: The expectations and experiences of pioneer ultra low carbon vehicle (ULCV) drivers

BURGESS, M. (Oxford Brookes University)

We report data from the first large scale systematic research into drivers of electric vehicles in the UK. In addition to technological and infrastructure advances, scientists, car manufacturers and the British government aim to use this trial to investigate ULCV driver expectations and experiences. To that end, our multi-method research has enabled us to reveal the psychological processes and practical issues associated with people’s initial choices and subsequent usage of ULCVs. Here we focus especially on private users (i.e., those who volitionally adopted an ULCV for their personal transport) and individual fleet users (those assigned an ULCV to fulfill work duties). Pre- and post- measures were used to gain information about the adoption of ULCVs. Questionnaires were completed at two points. The first data were collected after participants decided to participate in the ULCV national trial, but prior to gaining access to the vehicle. The second questionnaire data were collected after participants had driven their new vehicle for three months. In addition to the quantitative data, we conducted open-ended
interviews prior to participants gaining access to the vehicle, immediately after their first driving experience, and after one week of ULCV adoption. We will present the quantitative changes in participants’ confidence in range, expectations of usability, self-reported driving habits, as well as their attitudes to ULCVs, wider environmental issues and electric charging. The open-ended interviews allowed unanticipated user-determined issues to emerge. Consequently we were able to compare drivers’ prior motivations and expectations with their descriptions of actual experience. The qualitative data show how drivers report adapting to the handling and infrastructure associated with their ULCV and reveal the way in which their experience, knowledge and opinions developed over time. The data participants have provided are of particular interest as these people are among the first to have contemplated and prepared for the transition from driving a conventional combustion engine car to driving, and engaging with the essential supportive infrastructure for a fully electrically powered vehicle. Our results will contribute to the new field of ULCV psychology research and inform policy on ULCV adoption.

Does the use of battery electric vehicles change attitudes and behavior?

HOFFMAN, J. (Daimler AG)

The aim of this explorative survey was to find out the advantages and disadvantages of electric driving. What experiences do users make with a battery electric vehicle? How does it work in everyday life regarding for example range, recharging or performance? Do attitudes and behavior change over time while using an electric vehicle? This accompanying research was implemented within a pilot study in Great Britain in 2008 and 2009 with altogether 46 users of battery electric vehicles. It includes repeated face to face interviews with users in order to find out what they expect from an electric vehicle before they receive it and what their experiences are after having used the car for several months.

Furthermore focus groups were conducted to compare the user’s very first experiences with an electric vehicle and their long-term experiences after using the car for one year. Finally an online survey was launched to validate the results. Overall the participants of the pilot study are enthusiastic about the battery electric vehicle – after using it for one year the positive attitude towards the car increases. In contrast to their expectations and their very first experiences they get used to the range and learn that it is sufficient. According to this the confidence in range increases. When receiving the electric vehicle users feel uncertain about mileage but after using the car for a while anxiety on mileage is gone. They learn to handle it and adjust their driving behavior. First rational advantages (environmentally friendly, low running costs) turn into emotional ones: driving electric is easy and fun. The users like that the car is quiet but the long recharging time, the lack of infrastructure and high acquisition costs are still seen as a problem. Attitudes and behavior change over time when using battery electric vehicles. People learn by experience what the car can do and how to handle it. Rational advantages turn into emotional ones. Doubts are reduced and driving behavior changes in order to extend range. Users are more conscious about their journeys now.

Keywords: battery electric vehicles, attitudes, behaviour change, environmentally friendly behaviour, low running costs
Emotions at work

Chair(s): ASHKANASY, A. (Professor, University of Queensland Business School)

This symposium focuses on the role of emotions at work, an area of study that is of increasing significance within the wider organisational behaviour domain. The purpose of the symposium is to bring together established and emerging researchers in the emotions area and to discuss not only the current state of the field, but also where it is headed. In line with this aim, the symposium includes both theoretical and empirical contributions, with two papers outlining the findings of recent studies and two papers which present new models/issues for future emotions research to explore. In the first paper, the role of group affective climate is investigated, with results suggesting that affective climate acts as a mediator between leader-member exchange, group level team-member exchange and team performance. The second paper presents a multistage theoretical model of mistreatment at work, with the role of victim appraisal and coping responses emphasized as a potential “missing link” in previous attempts to explain the degree to which experiences of mistreatment negatively impact both individual and organizational outcomes. In the third paper, the potential for positive psychology - including positive emotion - to play an important role in addressing high rates of mental health issues within the legal profession is outlined, with an emphasis on how action now on multiple fronts may facilitate longer terms gains that would benefit not only individuals but also the profession, the firms within it, and the wider community. The final paper provides preliminary findings of an ongoing study investigating how employee status may affect the level of emotion work associated with customer interactions, with leaders using deep acting more often and thus managing the stress of emotion work more effectively than other employees. Overall, this symposium will show that the role that emotions play within the workplace is complex; requiring a dedication to research that does not oversimplify the phenomenon. It also emphasizes the magnitude of the need to understand emotions at work better, given the links to individual, organizational, and societal outcomes. It is this multilevel applied significance that positions emotions research as a field of rapidly rising importance.

Leader-member exchange differentiation, team-member exchange, and team performance: The role of group affective climate

TSE, H. (Griffith University Business School), LAWRENCE, S. (Griffith University Business School)

Recent research has begun to investigate the implications of leader-member exchange (LMX) theory on team effectiveness (Liden et al., 2006). This line of research results from the increasing recognition that the differential quality of LMX relationships within a team influences individuals’ work attitudes and behaviours; therefore understanding its underlying processes has strong implications for team performance (Liden et al., 2006). According to Dienesch and Liden (1986), leaders develop differential quality of relationships with employees within teams because of limited time and resources. The differential LMX relationships in teams appear problematic because employees are sensitive to social comparison information. The resulting altered self-concept may then influence their attitudes to working with their team members (Tyler & Blader, 2003). Based on this notion, we propose two psychological mechanisms – the mediating role of team-member exchange (TMX), and the moderating role of affective climate - to explain how the effects of LMX differentiation on team performance are transmitted through employees’ responses to their team members. TMX is defined as the effectiveness of individual member’s ongoing working relationships with other team members (Seers, 1989). Affective climate is defined as a shared positive perception among members and the atmosphere that characterize interactions within a team (Choi, Price, & Vinokur, 2003). In this study, our aims are to advance the research on LMX and team performance by developing and testing a team-level model. Specifically, we theorized that group-level LMX differentiation would exert its
impacts on team performance through group-level TMX. Group affective climate was hypothesized to moderate the relationship between group-level LMX differentiation and group-level TMX. The model was tested with a sample of 33 workgroups consisting of 243 bank employees. Hierarchical regression analyses showed that the relationship between group-level LMX differentiation and group performance was fully mediated by group-level TMX, and group affective climate moderated the relationship between group-level LMX differentiation and group-level TMX. For workgroups higher in affective climate, lower LMX differentiation among team members was associated with higher levels of TMX. Conversely, for workgroups with lower levels of affective climate, lower LMX differentiation among team members was associated with lower levels of TMX.

**Keywords:** leader-member exchange, attitudes, team-member exchange, performance, climate

**Antecedents and outcomes of mistreatment: The mediating role of victim appraisal and coping responses**

MICHALAK, R. (University of Queensland Business School)

Workplace mistreatment is a neglected construct in organizational behavior research. Little is known about how victims are selected, what they do in response to mistreatment including the role of appraisal, and how their responses impact on individual and job-related outcomes. After clarifying the definition of mistreatment, we attempt to address this gap in the literature by developing a mediated model that begins with a profile of attractive targets and attractive environments for mistreatment. Our attractive target profile introduces the notion of the ‘provocative victim’, and includes a number of yet to be explored individual differences such as work locus of control and trait aggressiveness. Our attractive environment profile includes ethical climate, situational power, laissez-faire leadership, organizational change and organizational formalization. We then propose that the mistreatment mediates the relationship between attractive targets and their environment, and victims’ appraisals of the experience, with appraisal then influencing their coping responses. In our model, appraisal is operationalized as the level of negative feelings associated with the experience, and the degree of control the victim perceives they possess to facilitate a change in the situation. Highly negative and refractory to change appraisals are associated with higher levels of stress for victims. We also expand existing coping models to include two new strategies, namely empowered exit (a problem-solving focused coping response) and retaliation (an emotion focused coping response). Taking into consideration the points made by Lazarus (2006) regarding the current tendency to oversimplify research on emotions, appraisal and coping, we suggest that a) appraisal and coping affect the relationship between the experience and the outcomes, and b) victim and situational characteristics influence whether problem-solving focused or emotion focused coping functions are more effective in reducing the impact of the experience on individual outcomes (psychological and health well-being) and job-related outcomes (commitment, citizenship behavior and job satisfaction). We derive a number of propositions from our integrated, mediated model of mistreatment and conclude with suggestions for future research, including testing the proposed model initially using cross-sectional designs and - on the premise it is supported – following up with longitudinal studies.

**Virtuousness in law firms – Positive practices and the bottom line**

JAMES, C. (University of Newcastle Law School)

Studies have shown high rates of depression among lawyers, manifesting in suicidal ideation, substance abuse and relationship difficulties. Law societies and bar associations have acknowledged the problem, responding mostly with counseling programs. Depression among lawyers has been associated with a general poor regard for lawyers and a belief that many lawyers are self-interested, incompetent, dishonest or otherwise
unprofessional. This paper discusses potential innovations for legal education and the practice of law which may reduce both dissatisfaction and dysfunction in the profession. Theoretical research in the area of positive psychology raises potential for practical interventions in legal education and training, as well as in organisational structure and function within the legal profession. Positive psychology focuses on positive emotions, character and institutions, and it connects notionally with therapeutic jurisprudence, which includes collaborative law, restorative justice and transformative mediation. Rather than encouraging law students to develop resilience to endure the stressors of legal practice, law schools could inspire students to be agents of positive change, which might lead to institutional change in the future. Rather than providing counseling to service lawyers’ mental health issues, law societies might encourage firms to adopt more than merely ethical practices and acknowledge their duty of care for employed lawyers. Rather than merely applying local laws in a commercial environment and rewarding solicitors’ unscrupulous billing practices with promotion, law firms could promote working for ideals of justice in the service of community and take a leadership role in law reform initiatives for the broad improvement of society. Organisational virtuousness is no longer a Pollyanna ideal, but can have positive return in outcomes as well as systemic positive change over time. This paper argues that positive legal practice and administration, following the principles of positive psychology, can improve not only lawyer satisfaction and employee retention but profitability, productivity and client satisfaction. The notion of virtuousness surpasses the mere ethical practice of law, which requires compliance with identified professional rules. The potential of taking the next step and applying positive psychology in legal education, and in the often-discredited profession of law, would be significant social and community benefit.

The status of employees in the service sector and its effects on emotion work in customer interactions

BERN哈RD T, L. (Goethe-University)

Research on emotion work has focused on how employees regulate their emotions in customer interactions with either positive or negative consequences on well-being and performance. So far, little research has examined differences in emotion work associated with the status of employees. There are conflicting opinions regarding emotion regulation requirements depending on the status: It is stated that leaders have more freedom regarding their emotional expression and thus emotion regulation should be easier for them (Mann, 1999; Sloan, 2004). Others argue that leaders are in a sandwich position and thus are required to display a variety of emotions and to make a lot of decisions regarding which emotions to express (Humphrey, Pollack & Hawver, 2008). Therefore, our aim is to analyze differences between leaders and employees regarding their emotion work processes in customer interactions. We have been conducting a questionnaire study in the German service sector. To date, 35 employees and 24 leaders have participated. The participants have a mean age of 40.34 years (SD = 12.99) and 72.9% are female. We used t-tests and covariance analyses to examine the data. The preliminary results regarding the emotional requirements as antecedents of emotion work show a significant difference in the frequency of displaying negative emotions, with leaders having to show them more often. Furthermore, leaders scored significantly higher on customer-oriented attitudes and emotional intelligence. Regarding the emotion regulation strategies, leaders used deep acting significantly more often than employees, even when controlling for length of professional experience. As a consequence of emotion work, leaders showed significantly better stress-management behaviour and self-rated effort. There are significant differences in the emotion work process during customer interactions depending on the status of an employee. Resulting questions to explore include a) whether employees who are more emotionally intelligent, more customer-orientated and better in regulating their emotions are more qualified and thus more likely to become leaders, and b) whether the workplace conditions of leaders (e.g. more scope, more training compared to those of
lower status employees) result in higher emotion work competencies. In the future, more research is needed regarding emotion work of different groups of employees.

**Emotions in driving - Recent research and theoretical perspectives**

Chair(s): UNAL, A. (University of Groningen), LEWIS-EVANS, B. (University of Groningen)

Affective state and the emotions or feelings which accompanying it may influence the way we perceive road situations, our decision-making and our driving behavior. In traffic psychology, some emotions such as anger and hostility have been studied extensively revealing high correlations between state anger and risky driving (Deffenbacher et.al, 2001). However, other emotions that may be experienced during driving, such as being happy, calm, excited, alert, aroused etc. have not been examined in quite as much detail. In traffic, feelings and emotions are also relevant to theories of risk perception (Summala 2005; Vaa 2007; Fuller, 2008). In particular ratings of feelings of risk strongly correlate with ratings of task-difficulty during speed choice (Fuller, 2005; Lewis-Evans and Rothengatter 2009). It is also possible that along with feelings of risk, other emotions such as anxiety, fear or calmness can act as affective signals that are providing information about the traffic environment. This symposium aims to gather recent research findings related to feelings of risk and emotions in driving. In general, we aim to discuss the issue within the scope of the broad theories of driver behaviour, and with reference to theories of affect that guide us in understanding how different emotions may affect risk perception, and willingness to take risks.

**Speed maintenance under heavy cognitive load – Implications for theories of driver behaviour**

LEWIS-EVANS, B. (PhD / University of Groningen),
DE WAARD, D. (Research fellow / University of Groningen)

No theory of driver behaviour has yet managed to achieve widespread acceptance and use in
the field of Traffic Psychology. In particular the theories differ in terms of their reference to the importance of risk in the control of everyday driving behaviour. There is however a general agreement among theories that if feelings of risk, which also seem strongly related to subjective impressions of effort and task difficulty, increase then drivers should take action to reduce these feelings. Reducing the speed of travel is the most common example of how drivers can effect their perception of these variables. This study seeks to examine how high cognitive load impacts on both the perception of feeling of risk, effort and task difficulty, as well as the ability of drivers to react to increases or decreases in these variables. Participants were asked to initially drive at their preferred speed for 1 minute in a driving simulator. Participant's speed was then automatically increased or decreased by 10 to 30 km/h. Participants were then required to maintain the new speed for two minutes, and for half of this time they also carried out a secondary PASAT task in order to increase cognitive load. Finally participants were asked to again drive for another one minute at their preferred speed. This procedure was repeated seven times, including a control condition where no speed increase or decrease was applied. After every one minute interval verbal ratings of feeling of risk, effort, task difficulty and typicality of the travelling speed were collected. This is in addition to monitoring their speed, lateral displacement and accuracy at the PASAT task. The results are currently being collected and analysed and will definitely be available by the time of the conference. Results will be discussed in terms of their implications for theories of driver behaviour.

### Proposing a driver behaviour model based on emotions and feelings: Proposing building blocks and interrelationships

VAA, T. (Researcher / Institute of Transport Economics)

A long-term aim in traffic safety research has been to establish driver behavior models that explain and predict driver behavior. Starting in 1938 with Gibson and Crook's theoretical field-analysis of automobile driving, a large number of driver behaviour models have been proposed over the years. One can, however, hardly say that the task of modelling driver behaviour has reached consensus. One of the main shortcomings is the lack of satisfactory understanding of the mechanisms that could explain the phenomenon of risk compensation. No deep understanding of risk compensation will emerge unless recent developments in cognitive psychology and neuroscience are well integrated in a model of driver behaviour. Hence, an alternative model which especially addresses risk compensation is needed. Several driver behavior models have been reviewed in order to select appropriate elements and processes between elements that may serve as building blocks in the establishment of an alternative driver behavior model. An alternative driver behaviour model, named the Risk Monitor Model (RMM), is proposed. It is argued that one of the main reasons for the disagreements between models is the lack of a deep, and comprehensive understanding of human cognition and emotion, i.e. how drivers think and feel, consciously and unconsciously. Damasio (1996) proposes an un-orthodox definition of emotion and feeling, which makes it possible to distinguish between unconscious and conscious processes that govern (driving) behaviour. Partly based on revisions of aspects of previous models, and partly by incorporating Damasio’s Somatic-Marker Hypothesis, a more complete driver behaviour model is proposed. Damasio (1996) states axiomatically, that man’s deepest motive is survival. It follows that man must have a risk monitor to survey the dangers that threatens man. It is argued that the body proper itself is the risk monitor. The proposed model also incorporates a separate model of information processing based on Reason, and a model of personality traits based on Ulleberg. Effects on accidents of affective states associated with Attention Deficit/Hyperactivity Disorder (AD/HD), Oppositional Defiant Disorder (ODD) and Conduct Disorder (CD) are discussed.

Keywords: traffic safety research, driver behaviour, risk compensation, cognitive psychology, information processing
**Affective state and willingness to take risks**

UNAL, A. (University of Groningen), STEG, L. (University of Groningen), EPSTUDE, K. (University of Groningen)

Past studies revealed that positive and negative affect or the emotions connected to them may influence risk-taking (Nygren et al., 1996; Loewenstein et al., 2001). With reference to two well-known theories of affect (Forgas, 1995; Schwartz & Clore, 1987), it can be argued that affect may lead people to use different information processing strategies based on expected motivational outcomes. In general, positive affect has been associated with willingness to take risks, while negative affect has been proposed to make people act more cautiously. However, in studies based on gambling tasks, this view has been challenged to some extent, revealing that when the perceived risk was high positive emotions may not always end up with risky decisions (Isen and Geva, 1987; Isen and Patrick, 1983). The aim of this study is to investigate the relationship between emotions and risk taking in the traffic domain. In driving research, effects of affect and emotions were not systematically examined, and some emotions like anger and anxiety were extensively studied while other emotions were partly ignored. In this study, we examined four distinct emotions that systematically vary on the basis of valence and arousal, and we looked at whether these emotions result in different patterns of risk-choice in traffic. In order to induce the targeted emotions, participants first watched short movie excerpts. Next, participants read scenarios describing a dilemma in traffic which required them to choose between a safe versus risky option. Ratings related to the reasons for choosing one of the options were also obtained. Data is still being collected, and the results will be presented on the basis of the differential effects of arousal and valence on willingness to take risks. We expect that emotions high in arousal and displeasure will lead to higher willingness to take risks. Implications will be discussed in relation to traffic safety and driving behavior.

Keywords: emotions, risk taking, information processing, willingness to take risks, arousal

**The effects of lead-driver status on the anger-experienced and aggression-expressed while ‘driving’**

STEPHENS, A. (University College Cork), GROEGER, J. (University College Cork)

There is a growing body of evidence which suggests individuals use status assessments to regulate emotions and behaviour (Allan & Gilbert, 2002; Conway, DeFazio & Mayman, 1999, Lively & Powell, 2006; Lovaglia & Houser, 1996). Further evidence suggests this status effect also occurs within the driving context (Turner & Layton, 1975) with drivers displaying higher levels of aggression toward road-users perceived to be of lower status (McGarva & Steiner, 2000). Two studies investigated the effects of lead-driver status on the anger-experienced and aggression-expressed in traffic scenarios in which the lead drivers’ actions were, or were not, determined by an event obviously beyond their control. Study One contrasted reactions to lead-cars bearing Learner driver markings (Low Status) or similar unmarked cars (Control), while Study Two contrasted reactions to Ambulances (High Status) or otherwise identical generic work vans (Control). Reported anger, heart-rate and behaviour were measured while drivers drove. When the lead vehicle slowed or changed course because of the actions of another road user, drivers were reliably more angered when slowed by a learner driver than an unmarked sedan. Drivers reported less anger when slowed by an ambulance, than by a work van, when there was no apparent cause for the lead-vehicle slowing. Driver behaviour also differed according to lead-vehicle status. Drivers allowed greater headway between themselves and a slower ambulance, but drove closer to the work-van, and followed learner drivers at a dangerously close distance, leaving greater headway behind a similar, unmarked car. It is concluded that anger experienced and expressed depends not on the actions of the perpetrator, but on the perceived status of that perpetrator. Higher status vehicles appear to be forgiven their indiscretions more readily even when there are no extenuating circumstances, whilst lower status drivers are blamed more readily for circumstances beyond their control.
Employee health and organisational health: A reciprocal relationship

Chair(s): MCWHA, I. (Massey University)
Discussant(s): FRYDENBERG, E. (University of Melbourne)

This symposium, comprised of members of the Health Division and the Organizational Division of IAAP, will describe the important interaction between physical and mental health and the success of organizations. The manner in which organizations function has a direct bearing on the health of their members and the health of the members directly affects the success of the organization. The first paper will describe the manner in which characteristics of the workplace are related to the experience of stress and how stress affects the health of the worker through changes in the central and peripheral nervous system. It will describe how the health of the worker impacts performance in the workplace. It will also describe techniques used in the workplace to both reduce and deal with psychological and physical problems and suggest a procedure for monitoring the well-being of employees and the organization. The second paper will present research that delves into the way employees manage the risk of work-related psychological injury from stressors. It describes the construction of a valid and reliable tool to measure the risks to health from the gap between job demands and resources to fulfill those demands. The third paper examines the role of depression as a psychosocial risk factor resulting from the difference between job demands and resources to fulfill those demands. It relates depression to organizational outcomes such as job satisfaction, productivity and intention to leave. This research is a part of the Australian Workplace Barometer (AWB) project. The fourth paper deals with the relationship between positive emotions (vigor, vitality) and the negative emotion (burnout) on the wellbeing of the worker and the success of the organization. It will describe the relationship between negative emotions and exhaustion,
cynicism and lack of feelings of accomplishment and the relationship between positive emotions and engagement and organizational success. It will present the thesis that positive emotions are incompatible with negative emotions and suggest procedures for intervention to reduce negative emotions. A Discussant will relate the four presentations and lead a discussion with the panel and the audience.

How organizations create stress and respond to the consequences of stress

REICHMAN, W. (Baruch College and the Graduate Center of the City University of New York)

A major juncture of health of the employee and health of the organization centers around job stress. Job Stress has been defined as the harmful physical and emotional responses that occur when the requirements of the job do not match the needs, capabilities, or resources of the worker. We are living at a time when the world of work is changing rapidly and the requirements are becoming less synchronized for the worker than ever before. The major world wide economic upheaval of the last year is only the last of a series of changes that have affected employees. The loss and threat of loss of livelihood and the perception of losses to fellow employees, friends and family has induced major stress. Aside from these, globalization, outsourcing, new technologies, legal and regulatory change and increased competition have all become major stress inducers. The stress has ramifications on the health of the employee through its affects on the nervous system. The resulting physical disabilities and behavioral dysfunction then affects absence, turnover, health insurance rates, restriction of productivity, aggressive behavior, sabotage and an absence of engagement in the organization. Stress results in an unhealthy employee and eventually in an unhealthy organization. The unhealthy employees also affect the wellbeing of their family and therefore have ramifications in organizations beyond the one they work in. Management is beginning to recognize the relationship between stress and their organization’s success and is beginning to take steps to reduce stress and to alleviate the conditions that cause stress. In an attempt to relieve stress they are looking at such factors as safety conditions, job design, supervisory practices, management control, diversity and the general culture of the organization and the leadership that drives it. In addition, progressive organizations are instituting programs to deal with employee problems. Among these programs are Employee Assistance Programs, health, exercise and stress management programs, networking and mentoring programs and diversity programs. Their affect on the well being of the employee and the organization will be described. A procedure for monitoring both the health of the employee and the health of the organization will be described.

Keywords: job stress, health, stress management, employee assistance programs

Development of a psychological risk assessment tool to aid compliance with health and safety legislation: The People at Work Project

WAY, K. (Workplace Health and Safety Queensland, Department of Justice and the Attorney General, Queensland)

The People at Work Project is a collaborative research initiative between the government health and safety regulator, the University of Queensland, and the University of South Australia. The project was initiated in recognition of the need for increasing employer capacities to manage the risk of work-related psychological injury, particularly in relation to obligations outlined in health and safety legislation around the country. The project has a number of objectives including the development of a reliable and valid tool to assess the risk of work-related injury from exposure to psychosocial stressors. Drawing on existing models of occupational stress, the project researchers are developing a risk assessment tool which measures a range of job demands and job resources that are applicable to diverse working environments. To date, the risk assessment tool has been utilized by a sample of 40 organizations and approximately 6000 workers in a cross section of industries and occupations. Once validated, and the normative database is established, the risk assessment tool will become freely available,
providing an avenue for industry and occupational-level benchmarking. In addition to the development of a psychometrically sound risk assessment tool, the project also provides a structure for participating organizations to implement a risk management process for occupational stressors. Both the organizational processes used in conducting risk management for occupational stressors, and any interventions conducted by organizations in an attempt to reduce the risks associated with these stressors, will be evaluated.

Keywords: psychological injury, risk assessment, job demands, job resources, risk management

Depressed or engaged: Psychosocial risk factors, psychosocial safety climate, depression and engagement through the lens of the job demands-resources model

HALL, G. (University of South Australia)

In February 2009 the Australian Workplace Barometer (AWB) project was launched with data collection for the first wave of the AWB survey. The aim of the AWB project is to monitor the prevalence of psychosocial risk factors and counteractive factors with regard to workers’ health, engagement and work productivity outcomes, and to identify ‘at risk’ groups. The AWB project is also a longitudinal general population-based test of the expanded Job Demands-Resource (JD-R) model of work stress and job engagement. The JD-R model emphasizes burnout as an intermediary mental health state between demands and negative health and organizational outcomes. In the present study we extended this research by examining the role of depression instead of burnout between psychosocial risk factors (i.e. job demands), counteractive factors (i.e. job resources), worker engagement, worker health and organizational outcomes (i.e. job satisfaction; intention to leave; and productivity). Mental health burden including depression represents the greatest population disability burden in Australia and there is good evidence that working conditions affect mental health (see Victorian Job Stress Survey). The present study also measures perceptions of psychosocial safety climate (PSC) in order to gauge up-stream (management) attitudes regarding the importance of workplace psychological health. This paper reports on the first wave of data collected from the AWB survey. Statistical analysis using structural equation modelling was used to test sequential mediated pathways between the latent variables PSC, JD/R, Depression, Organizational Outcomes. Among N = 2230 workers it was found that, PSC was related to organisational outcomes via demands, and in turn to depression. Further in support of the JD-R model it was found that, PSC was related to organisational outcomes via job resources, and work engagement. This paper contributes towards evidence based solutions to alleviate the effects of psychosocial risk that can contribute to worker depression with a further view to promote better PSC in organisations that reduce the effects of psychosocial hazards.

Keywords: psychosocial risk factors, job demands-resources model, work stress, job engagement, psychosocial safety climate

Positive emotions, health and burnout

GREENGLASS, E. R. (York University, Toronto)

Recently research has focused attention on the study of positive emotions and behavior and their implications for psychological and organizational functioning and health. For example, Fredrickson developed the broaden-and-build theory of positive emotions to explain the adaptive role of positive emotions. In discussing the broadening hypothesis, she argues that psychological and physical well-being may be increased by cultivating experiences of positive emotions to counteract negative emotions. Within the organizational sphere, research has focused mainly on negative constructs such as job burnout and its deleterious effects on health. Burnout is associated with negative emotions and behavior in which the worker may experience exhaustion, cynicism and a decrease in feelings of accomplishment on the job. Another concept that is increasingly being studied both within the organizational and clinical spheres, is that of engagement or vigor which may be seen as reflecting a positive motivational/emotional approach to one’s endeavors. Moreover, subjective feelings of
well-being are characterized by self-reported vitality, positive affect and approaching one’s goals. Recent research suggests that work engagement and vigor promote increased psychological well-being. The relationship between burnout and engagement is explored here in light of recent research showing that positive affect can occur during periods of chronic stress and that it may be associated with improved health related outcomes. The conceptual approach put forth in the present paper is based on the hypothesis that positive emotions are incompatible with negative ones. Theoretical and empirical implications of this approach are explored in this paper. Suggestions for interventions within the organizational sphere are explored as well.

Keywords: positive emotion, organisational functioning, job burnout, well-being, engagement

Environmental problems and risk perception

Chair(s): DE GROOT, J. (Bournemouth University)

There is a growing awareness that human behavior contributes to environmental problems such as water pollution, decline of biodiversity, and desertification (Intergovernmental Panel on Climate Change [IPCC], 2007). It is increasingly recognized that pro-environmental actions are essential for decreasing these problems and to promote sustainable development. This symposium focuses on these environmental problems and how to decrease these environmental problems from a risk perspective. We will show various psychological factors that contribute to (reducing) risky behaviors (Paper 1, 2, 3 and 4). We also discuss how environmental psychology can benefit from other disciplines to reduce environmental problems (Paper 5). Throughout this symposium, we will integrate our findings with existing research on risk perception and we will discuss the theoretical and practical implications of current psychological research. The learning objectives of this symposium are: (1) an understanding of current empirical research in the field of risk perception; (2) an increased critical awareness of theoretical models used to link environmental problems to risk perception; (3) an understanding of psychology's role in explaining and predicting risk perceptions and risk behaviors.

Morality and nuclear energy: Perceptions of risks and benefits, personal norms and willingness to take action towards nuclear energy

DE GROOT, J. (Bournemouth University), STEG, L. (University of Groningen)

In this study, we aim to examine whether the Norm Activation Model (Schwartz, 1977) is a relevant framework for explaining willingness to take action in favor of or against an increase in supply and use of nuclear energy in the Netherlands. In a questionnaire study among a
representative Dutch sample ($N = 123$), we measured perceptions of risks and benefits, personal norms and willingness to take action in favor of or against nuclear energy. We examined the relationships between these constructs by means of regression analyses. The Goodman version of the Sobel test was used to test the significance of the mediation effects. We also checked if the proposed model better explains willingness of opponents to take action against nuclear energy than willingness to take action in favor of nuclear energy of supporters by computing confidence intervals around the difference in $R^2$. The results confirm that beliefs on risks and benefits of nuclear energy together with personal norms (PN) towards nuclear energy are powerful in explaining willingness to take action in favor of or against nuclear energy in the Netherlands. As expected, perceptions of risks and benefits were directly related to PN towards taking action in favor of or against nuclear energy, PN were strong predictors to explain willingness to take action, and, most importantly, PN mediated the relationships between perceptions of risk and benefits and willingness to take action. Beliefs on risks and benefits together with PN explained significantly more variance in willingness to take action of opponents than of supporters. Also, beliefs about the risks and benefits of nuclear energy were less powerful to explain PN for supporters compared to opponents. Our results support the norm activation model. The findings also suggest that opponents are focused more on collective risks than on personal benefits and therefore intend to act more out of normative considerations. Therefore, although a moral framework, such as the norm activation model, is useful to explain willingness to take action in favor of or against nuclear energy, it is more useful when explaining the latter.

The impact of Swiss anglers’ mental models on perceived risks and benefits of fish stocking behavior

VON LINDERN, E. (Swiss Federal Institute of Aquatic Science and Technology), HAERTEL-BORER, S. (Swiss Federal Institute of Aquatic Science and Technology)

Fish stocking has been identified as a possible threat to whole aquatic ecosystems. Nevertheless, studies among Swiss recreational fishermen showed that they appreciate fish stocking as a management tool, attribute much influence to it and a majority of them wants to keep stocking at the current level or even plans to increase it. By collecting the mental models of Swiss recreational fishermen we want to get a deeper understanding of the anglers’ attitude towards stocking. Additionally, we want to know whether – and to what degree – they see risks for the ecosystem from applying fish stocking as a fisheries management tool. We conducted a preliminary qualitative study and applied the structure-laying-technique in combination with an open-ended theme-focused interview to collect mental models of 12 recreational fishermen. As a follow-up study we mailed a survey to 3,315 Swiss anglers and asked for relations between components that emerged from analyzing the interviews, the attitude towards fish stocking and for perceived risks and benefits of fish stocking from the anglers’ point of view. In the interviews we found two different types of mental models for the anglers regarding fish stocking: The first mental model states that fish stocking should be done independently from the efficiency of natural reproduction (additive type) while the other mental model claims that fish stocking should only be done if there is a lack of natural reproduction (compensatory type). For the nationwide survey study we received a total of 418 responses and found that the anglers who could be allocated to the compensatory type have a more differentiated attitude towards stocking, attribute less influence to it and see more risks and fewer benefits regarding fish stocking than the anglers who could be allocated to the additive type. Theses differences were all significant ($p < 0.05$). Analyzing mental models provides a more comprehensive understanding of stakeholders’ management behavior. The perception of risk and benefit depends on the underlying mental model. For inadequate risk/benefit perception, mental model analysis offers a good starting point for intervention planning.
The consumption of fluoride free drinking water using filters in rural Ethiopia

GONZALEZ, A. (Swiss Federal Institute of Aquatic Science and Technology), MOSLER, H. J. (Swiss Federal Institute of Aquatic Science and Technology)

In the Ethiopian Rift Valley, which inhabits about 10 million people, the ground water contains an excess of fluoride concentration. The consumption of this water leads to a high risk of dental and skeletal fluorosis. Unfortunately, it has been found that the medical treatment of dental and skeletal fluorosis is difficult and mostly ineffective. The main purpose of this study is to assess the personal, social, and situational factors that influence acceptance and continuous use of fluoride removal systems on household level, and to test behavioral measures that are useful to increase the habitual use of fluoride removal systems. For preliminary data, 120 households from two rural villages in the Ethiopian Rift Valley, who were part of pilot project, were interviewed. These households own a fluoride removal filter for over a year. The survey was conducted by local interviewers with a structured face-to-face interview. The questionnaire contained items on current water consumption, awareness, perceived vulnerability, severity of health threat, knowledge, convictions towards filter use, filtered water and raw water, social influences, willingness to pay and habit strength. Multiple linear regressions were used to analyze the data. The data analysis showed that the households only occasionally are using the filters to prepare their drinking water. Moreover, the households still use the filtered water for cooking purposes. The data confirmed that the users have not yet created a habit concerning the use of the filter. Regression analysis revealed that forgetting and commitment are important factors to predict habitual use of the filter and the habit to consume fluoride free water. Nevertheless, situational factors (e.g. concerning maintenance problems) and above all convictions about taste and effectiveness of the filter media found also to be important for predicting the filter use. The identification and analysis of the found predictive factors enables the development of psychological strategies with which the preventive innovations are accepted and used regularly in matter of habit by the population in rural Ethiopia. Continuous and habitual use is necessary for preventing fluorosis and therefore psychological interventions are an important approach to reach the study's goal.

Keywords: ground water, fluoride, fluorosis, fluoride removal systems, Ethiopian Rift Valley

Risky consumption of drinking water: Predicting the use of arsenic-safe drinking water options in Bangladesh

INAUEN, J. (Swiss Federal Institute of Aquatic Science and Technology), MOSLER, H. J. (Swiss Federal Institute of Aquatic Science and Technology)

Twenty million people in Bangladesh are at risk of consuming naturally occurring, arsenic-contaminated groundwater. Although arsenic-safe water options (e.g. dug wells) have been installed to mitigate this environmental health hazard, many people keep on using contaminated water sources, i.e. shallow tubewells. This study is aimed at identifying factors derived from health-behavior theories, such as the Health Action Process Approach (HAPA), and social influence theories, such as the Theory of Planned Behavior (TPB) that predict people's consumption of arsenic-free drinking water. Eight hundred households in rural Bangladesh were surveyed by structured face-to-face interviews. Sampling areas in different geographical regions of Bangladesh were defined according to the availability of arsenic-contaminated water and the availability of one or more of eight arsenic-free water sources. Within each study area, households were chosen by random route sampling. The questionnaire contained items on water consumption, risk perception, knowledge, attitudes towards different water sources, social influences, self-efficacy, and willingness to pay. The data was analyzed by multiple linear regressions. Our analysis confirmed that many households in rural Bangladesh still consume arsenic-contaminated water, despite the availability of
alternative water sources and increasing risk awareness. Multiple linear regressions revealed the importance of social influences on the consumption of arsenic-free drinking water. However, also convictions (i.e. about the taste, smell, temperature of the water), self-efficacy and perceived barriers were found to be predictive of people’s use of uncontaminated water sources. The present study successfully identified important factors predicting the consumption of arsenic-free water in rural Bangladesh. From the results, psychological interventions can be derived and field-experimentally tested regarding their efficacy of influencing the behavior determinants revealed in this study and increasing people’s use of arsenic-safe drinking water sources. Thereby, psychology can make an important contribution to mitigating geogenic contamination in Bangladesh and other places in the world where low water quality poses a public health threat.

**Keywords:** contaminated groundwater, health action process approach, theory of planned behavior, risk perception, Bangladesh

**Sustainable consumption in environmental dilemmas? The necessity of interdisciplinary approaches**

BECKENKAMP, M. (Max Planck Institute for Research on Collective Goods)

Since the late 1980s the ecologically based concept of physical sustainability has been put in the wider context of social and economic development. Consequentially, a number of interdisciplinary approaches between natural and social scientists began (Ohl et al., in press). With regard to sustaining biodiversity it is seldom in the self-interest of consumers to behave cooperatively (i.e. conservation-friendly manner, (Montada & Kals, 2000)) Therefore, the ecological goals (like biodiversity goals both in natural and cultural biodiversity) pursued by striving for a sustainable consumption are threatened by a “drama of the commons” (Ostrom et al., 2002). In the past this structural impact was ignored in many approaches, because besides informing consumers about the actual state of things both with respect to the relationship between consumption and sustainability, it is also important that consumers are informed about the social dilemma beyond that. It may well be that this information alone is not sufficient to change considerably consumers’ behavior to more sustainable consumption, but it probably will raise the acceptance of institutions that help to find fair prices, i.e. prices where the market failures are alleviated or even annihilated. However, the implementation of such institutions – accompanied with controls and sanctions – and the efficiency of institutions is a research question of institutional design. Until now, environmental psychology barely tied in with that research, although it has accumulated piles of research on decisions in social dilemmas. The method of this study involved experiments on social dilemmas. The results show that information policy about social dilemmas matters. Awareness about the dilemma raises the willingness raises the acceptance of institutions that help to solve the dilemma. Psychological knowledge about social dilemmas is both relevant and would be fruitful in raising the efficiency in the implementation and the governance of institutions.

**Keywords:** biodiversity, sustainable consumption, sustainability, social dilemmas, consumption
**Ethical and organisational issues in practice management**

Chair(s): STOKES, D. (The Australian Psychological Society)

The changing circumstances in both the public and private sectors of professional activity have brought a variety of management and employment relationships. Not only does this impact on the complexity of organisational and contractual arrangements, but it has led to various forms of relationships around file management, file ownership and access to records. These new work arrangements raise many issues which are also produced by the high-level of ethical standards required of psychological practitioners with regard to client information. In addition, the formation of new work arrangements raises a range of legal and contractual issues.

**Models of practice and contractual relationships**

STOKES, D. (The Australian Psychological Society)

Many of the issues about which practitioners seek advice and support from their professional association are related to the nature and type of relationships established in their practice. Before you can provide principles of practice and specific advice about procedures, it is necessary to clearly identify the model of practice in operation – regardless of whether it is a professional practice in the public or private setting. To this end, this presentation will provide a typology of professional practice models and demonstrate by reference to specific models the impact that a variation in model can have on issues such as file access. Implications for practitioners when considering setting up or varying their practice structure will be identified.

Keywords: typology, professional practice

**File management and record keeping in the new health scene**

MATHEWS, R. (The Australian Psychological Society)

Issues of client file management, ownership and access to client records are complex, demanding and often raise concerns for many psychologists in private and public settings. Establishing a set of agreed principles and guidelines to protect clients and practitioners is necessary. The Australian Psychological Society, as a professional society concerned with managing practice standards, is aware of the concerns that these issues cause practitioners. Drawing on the varying models of professional practice, issues of file management related to these models are identified and possible solutions discussed in the context of a range of practice settings. Particular note is made of the implications for file management in the public sector and the possible impact of the emergence of the electronic health record.

Keywords: file management, record keeping, electronic health record

**Legal responsibilities in file management**

JIFKINS, J. (The Australian Psychological Society)

Legal requirements of practitioners working within various contractual and employment arrangements regarding client records are often poorly understood. The impact of legislative and legal processes on matters such as file storage, ownership and access will be outlined in this presentation along with possible consequences for violation of these requirements. Practitioners will be provided with a range of legislative and legal concepts that will guide and direct their professional activities.

Keywords: legal responsibilities, file management
Ethical challenges for psychologists who work with detainees

Chair(s): ALLAN, A. (Edith Cowan University)
Discussant(s): KOOCHER, G. P. (Simmons College)

This symposium explores the unique ethical challenges that confront psychologist who work with people in various forms of detention which place restrictions on their freedom. Individual presentations address ethical challenges facing psychologists and related challenges to detainees’ human and civil rights in custodial, immigration and security detention settings. The focus of presentations will be on how psychologist can avoid the mistakes of the past.

Australia’s off-shore mandatory immigration detention of asylum seekers: Ethical challenges for psychology

DAVIDSON, G. R. (University of the Sunshine Coast)

The paper examines Australia’s current policies and practices relating to the off-shore processing of asylum seekers, as they may influence the ethical professional practice of psychology. It briefly analyses Australian political discourse on the themes of border security, people smuggling and queue jumping before discussing the implications of off-shore processing for asylum seekers’ human and legal rights and for mandatory detention of minors and their families. It then examines the ethical challenges for psychologists working in immigration detention that arise in circumstances involving multiple clients, role overlap between assessment, therapeutic treatment and crisis management or negotiation, limits on clients’ autonomy to protest against perceived human rights violations, and conflicts between ethical professional standards, international human rights conventions and local law. Application of the principles of beneficence and non-maleficence is informed by existing research findings about the effects of on-shore mandatory detention on the adult and minor detainees’ mental health and psychological wellbeing.

Keywords: asylum seekers, ethical practice, immigration detention, ethical issues

Forensic psychologists in prisons: A normative framework to ensure ethical offender rehabilitation

BIRGIN, A. (Deakin University)

The roles of forensic psychologists in coercive environments, such as corrections, include that of treatment provider (for the offender) and that of organizational consultant (for the community). This dual role raises ethical issues between offender rights and community rights; an imbalance results in the violation of human rights. A timely reminder of a slippery ethical slope that can arise was the failure of psychologists to manage this balance in the interrogation and torture of detainees under the Bush administration. To establish a “bright-line position” regarding ethical practice, forensic psychologists need to be cognizant of international human rights law (Birgden & Perlin, 2009). In this endeavor, international covenants and a universal psychological ethical code ought to guide practice, although conflicts between the law and ethics codes will arise. A solution to this problem is to devise a normative framework that is based on human rights values. Human rights are based on legal, social, and moral rules. Human rights literature generally considers legal and social rights but do not provide principles to guide forensic psychologists in addressing moral rights. Ward and Birgden (2007) have proposed a human rights model for offender rehabilitation. Meeting offender rights includes ensuring core values of well-being and freedom. Well-being is the right to physical, social and psychological health. Freedom (albeit restricted) is the right to be treated with respect and dignity and to be afforded the opportunity and capacity to make autonomous decisions about how to live a life. A normative framework based on human rights will be proposed. The aim is to guide psychologists in the assessment of risk,
Ethical challenges facing psychologists working in national security detention settings

BEHNKE, S. H. (American Psychological Association)

This presentation will focus on the unique ethical challenges of psychologists working in national security detention settings. Drawing upon the experiences of the American Psychological Association in addressing the ethical aspects of psychologists' involvement in interrogations, the presenter will describe the evolving position of the American Psychological Association related to detention facilities between 2005 and 2010. The presentation will discuss how the ethical issues were framed by American Psychologists, and highlight the distinction between psychologist behaviors and detention settings as addressed in American Psychological Association resolutions. The presenter will identify ethical challenges for psychologists unique to national security detention facilities, and will reflect on lessons for psychologists who will be working in national security detention facilities in the future.

Keywords: ethical issues, detention settings, American Psychological Association

Ethical issues in professional psychological practice: Future challenges

Chair(s): GORDON, A. (Private Practice)

Discussant(s): SYMONS, M (The Australian Psychological Society)

This symposium will examine emerging ethical issues in the practice of psychology in three areas: Confidentiality, cyber ethics and the maintenance of professional boundaries. Worldwide, psychology is practiced in an increasingly complex and enmeshed web of professional and organisational roles. Globally psychologists are also working in changing legal contexts. Such structural, technological and legal changes have a considerable impact on the ethical practice of psychology. These three papers will address changes in the conceptualisation of confidentiality, the new challenges introduced by the development of delivery of psychological services online, and the maintenance of professional boundaries in the environment of contemporary practice. How relevant codes of ethics address these issues will be examined.

The first paper will address shifting perspectives regarding confidentiality, privacy and privilege. The second paper will consider how existing ethical frameworks and codes of practice for psychology can be applied to emerging modes of electronic service delivery. The third paper will present an analysis of the type of boundary violations that have led to complaints being upheld against psychologists in an Australian context. It will argue that psychologists need to be aware of changing conceptualisations of boundary issues.

Confidentiality, privacy and privilege in the relationship between client and psychologist

MCMAHON, M. (La Trobe University)

Information is routinely imparted by clients to psychologists with the expectation that it will...
not be disseminated more widely than authorised by the client. Indeed, confidentiality and privacy are frequently held to be defining features in the relationship between clients and psychologists. The special sensitivity attached to health information is frequently recognised in legislation. However, in Australia privilege is not often accorded to the clients of psychologists. Developments in the delivery of psychological services and changes in the law have impacted considerably upon the disclosure of health-related information and issues of privacy, confidentiality and privilege in contemporary Australia. The growth of multidisciplinary treatment teams and the proliferation of electronic means of recording data have substantial implications for the management of client information and the introduction of privacy legislation has contributed to an ever-growing body of law that affects both information disclosure and protection. Psychologists are often confronted by multiple – sometimes competing – demands. This presentation will try to untangle some of this complexity by outlining key professional and legal issues relating to confidentiality, privacy and privilege in Australia.

Cyberethics for cyberpsychology: Emerging issues from anxietyonline.org.au.

AUSTIN, D. (National eTherapy Centre, Swinburne University of Technology)

Many of the existing ethical frameworks and codes for the practice of psychology may be usefully employed in the provision of emerging modes of service delivery alternately known as "eTherapy" or "cyberpsychology". Nevertheless, emerging modes of practice and communication technologies continue to force practitioners, regulators and policy-makers to revisit ethical codes of conduct. Anxietyonline.org.au is an internet-based assessment and therapy provider funded by the federal Department of Health and Ageing. Experiences from this service highlight many of the new ethical challenges raised by cyberpsychology and hence the urgent need for progressive and dynamic codes of ethical conduct relevant to this rapidly expanding modality.

Keywords: ethical codes of conduct, communication technologies, cyberpsychology

And authors boundaries and multiple relationships in contemporary psychological practice: Risk management

KNOWLES, A. (Swinburne University of Technology)

Psychology is practiced in an increasingly complex and enmeshed web of professional and organisational roles. This paper examines ethical principles supporting the maintenance of professional boundaries and how relevant codes of ethics address these issues. While it has long been argued that psychological practice is threatened by boundary crossings and violations within the professional relationship, this paper argues that the modern environment in which psychology is practiced increases the likelihood of dual role relationships occurring. Australian case examples of specific boundary violations are analysed and the justifications given by practitioners for their behaviour are considered. The paper will conclude with suggestions for practice regarding how psychologists might avoid harmful boundary violations.

Keywords: professional boundaries, ethics, psychologists, boundary violations
Evaluation of a therapeutic program for child protection clients: The Take Two program

Chair(s): PAWSEY, R. (Director, Take Two)
Discussant(s): RADOVINI, A. (Director, Mindful Centre For Training and Research in Developmental Health / Deputy Chief Psychiatrist, Child and Youth)

This symposium provides an opportunity to reflect on the clinical, research and training aspects of a therapeutic program for child protection clients. Take Two provides therapy directly with children who have suffered maltreatment (0-17 years) and their significant relationships, and works with the broader system. Take Two is run by a consortium of a child welfare agency (Berry Street), a child and adolescent mental health service (Austin CAMHS), a university (La Trobe University), a teaching organisation for mental health services (Mindful) and an Aboriginal community controlled organisation (Victorian Aboriginal Child Care Agency). It is funded by the state government to (i) provide a high quality clinical service to child protection clients and (ii) to contribute to service system improvement. As such Take Two provides a range of therapeutic services, such as through general clinical teams, an Aboriginal team, and a therapeutic service to Secure Welfare. It is also funded to undertake research and to provide training to the broader field. As part of this work, Take Two has formed collaborations with international partners such as Professor Bruce Perry (Child Trauma Academy, USA). This symposium will briefly describe Take Two and its conceptual framework, which is based on a developmental and ecological perspective and is informed largely by attachment and trauma theories. It will examine the application of an outcomes framework and report the findings on two outcome measures (SDQ and TSCC). There will be a description of the work involved in Secure Welfare and with Aboriginal clients. There will also be a presentation on the training strategy developed to disseminate understanding of trauma and attachment as it applies to foster care, residential care, schools, child protection, youth justice and other settings. The key learning objectives include: Exploration of a clinical service and its outcomes for children using attachment and trauma theory; Consideration of how attachment and trauma-informed practice is used with different populations, such as child protection client group, Aboriginal children and children in care; and examination of a training strategy as part of a clinical intervention towards positive outcomes for children and the broader service system.

Take Two research: Using outcome measures in a clinical program

FREDERICO, M. (Head, School of Social Work and Social Policy, La Trobe University)

To present findings on the Take Two program’s use of clinical outcome measures to gain insight into the children’s presentation and examine whether Take Two contributes to more positive outcomes for children. Take Two has developed an outcomes framework and the suite of clinical outcome measures used includes the Strengths and Difficulties Questionnaire (SDQ, Goodman, 1999), the Trauma Symptom Checklist for Children (TSCC, Briere, 1996) and the Trauma Symptom Checklist for Young Children (TSCYC, Briere, 2005). The SDQ is a standardised measure of psychological adjustment and behaviour for children. There are three versions: a self-report; a parent/carer; and a teacher version. The TSCC and TSCYC are measures designed to assess the impact of exposure to traumatic events in children. There are six clinical scales reflecting different aspects of traumatisation. The TSCC is a self-report measure and the TSCYC is completed by parents and carers. These outcome measures are administered by clinicians during the assessment period, at each six monthly review and at closure. The children for whom the measures were completed at baseline demonstrated major difficulties. The SDQ revealed some significant differences in terms of gender and age and to a lesser extent with Aboriginal identity. There was significant change for these children in a range of areas. Young people themselves identified positive changes in a number of areas. The group less
likely to see significant changes was teachers. The baseline data of the TSCC and TSCYC demonstrates that a number of children score in the clinical range of trauma symptoms at the time of assessment. When looking at change over time the findings indicate that Take Two is making a difference in a range of areas related to post-traumatic stress symptomatology, namely anxiety, depression, anger and post-traumatic stress. Use of the SDQ, TSCC and the TSCYC as clinical outcome measures provide insight into the children’s psychological adjustment, posttraumatic symptoms and related psychological problems. The evidence so far demonstrates that children involved with Take Two are making a positive difference in their lives.

**Keywords:** Take Two program, children, psychological adjustment, Aboriginal identity, trauma

### Characteristics of a high-risk adolescent population: Take Two in secure welfare

**MCKENZIE, R.** (Manager, Therapeutic Care, Take Two)

To present data on a high risk population of adolescents in child protection who are placed in Secure Welfare and to explore the therapeutic implications. Since the establishment of Take Two in 2004, it has provided a therapeutic specialist role embedded within a Secure Welfare setting. Secure Welfare is a Victorian government secure facility consisting of one 10 bed unit for young men and another 10 bed unit for young women (aged between 9 and 18 years). Young people are admitted to Secure Welfare if they are on a child protection court order and are considered to place themselves at high risk of harm, including self-harming, absconding, substance abuse, commercial sexual exploitation and other high risk activities. Admissions are brief, ranging from 24 hours to 21 days. Following a description of the work by Take Two in Secure Welfare, there is analysis of referral data regarding the maltreatment experiences of the young people according to child protection and their emotional, physical, developmental and social presentations. This is collected through a purposefully designed referral tool, known as the Harm Consequences Assessment as well as other referral documents. Some comparisons are made between the Take Two population in Secure Welfare and the remaining Take Two client group of the same age range. Of the 1063 referrals to the Take Two program since 2004, 39% were for high risk young people in Secure Welfare. These young people shared many characteristics with the rest of the Take Two population but also had a range of significant differences. Differences included their history of child protection involvement, their experiences of abuse and neglect, and their emotional and behavioural difficulties. Although some of the differences in history and current presentation were as expected other differences were surprising and require further discussion and examination. This data highlights the importance of not making assumptions about high risk young people or perceiving them as a homogenous group. Implications for assessment and recommendations to the broader service system are also discussed.

**Keywords:** high-risk, adolescents, Take Two program, secure welfare, child protection

### The Take Two approach to culturally-appropriate practice with Aboriginal clients

**COADE, S.** (Manager, Aboriginal Service Development, Berry Street)

Take Two has a strong commitment to practice culturally-appropriate therapeutic interventions. To achieve positive outcomes for Aboriginal children, a community and family orientation along with a cultural perspective is needed. To this end, Take Two has developed a state wide Aboriginal Team that performs clinical, program development, and training functions. This paper presents two tools developed by the Aboriginal team to promote culturally appropriate practice: the Aboriginal and Torres Strait Islander (ATSI) assessment tool and the Yarning Up on Trauma (YUT) training. The ATSI assessment tool is a semi structured questionnaire designed to assist non-Aboriginal clinicians in their assessment of Aboriginal children’s connection to their culture, history, identity, and key people in the community, in order to
strengthen these connections. YUT is a unique amalgamation of training and community therapeutic intervention for those working with the Aboriginal population. It was designed in conjunction with VACCA to assist workers in ATSI organisations to understand historical and present day trauma, and to assist those workers to recognise and deal with their own trauma as well as trauma of the children and families they work with. Feedback is collected from participants on the effectiveness of the intervention. Data from 41 completed ATSI tools showed that a substantial number of Aboriginal clients are disconnected from their land and culture, and indicate directions for therapeutic intervention to strengthen their connection. In addition, the nature of placement (e.g., kinship or foster care) was not associated with a child’s cultural connection. Data from 170 participants over 13 YUT programs showed that YUT was useful to most participants, and indicate the most helpful elements of the program. The findings indicate the potential of these tools to promote culturally-sensitive practice with the Aboriginal population. The ATSI tool provides useful information to assist non-Aboriginal clinicians in assessment and intervention planning for the cultural needs of Aboriginal clients. The YUT program provides direction for the content, format, and staffing of culturally appropriate training programs, as well as the need to acknowledge and provide for the likely therapeutic needs of the participants.

Keywords: Aboriginal, Take Two program, training, community, trauma

The role of training in building capacity of the broader service system.

TANTI, C. (Senior Practice Development Officer, Take Two)

One of the objectives of the Take Two program is to build capacity within the community services, health and education sectors to provide a therapeutic response to children and young people who have experienced abuse and/or neglect. Take Two provides training to workers in these sectors in order to increase their understanding of the impact of abuse and neglect on children’s development, and to increase their ability to respond therapeutically to children’s behaviours associated with trauma and attachment disruption. This paper presents two such training packages: “With Care” for workers in the residential care sector, and “Calmer Classrooms” for staff in the education sector. The “With Care” 2-day package was developed in partnership with a major residential care provider (Westcare), for residential care staff across Victoria. The “Calmer Classrooms” training was designed to support the booklet commissioned by the Office of the Child Safety Commissioner, and is developed to suit the individual school (ranging from a one-hour to a full-day program). The training packages are tailored to the participants’ specific work setting in terms of content, format, and presenters. Data was collected through participants’ evaluations of the training. Data from 424 participants in the “With Care” training showed that the majority of participants reported the training greatly increased their understanding/knowledge (58%-70%) and greatly increased their confidence/ability to apply this understanding to various aspects of their work (66%-85%). Data from 196 participants in “Calmer Classrooms” training were even stronger; and showed that 95.92% of participants strongly agreed or agreed that the training increased their understanding/knowledge, and 86.22% strongly agreed or agreed the training increased their confidence/ability to apply these understandings to their work practice. The findings suggest that these training packages are highly effective in increasing workers’ understanding of the impact of abuse and neglect on children and confidence in their ability to respond therapeutically to trauma and attachment related behaviours in their clients. As such the findings indicate that tailored training packages for workers in related sectors can support clinical interventions by building capacity to provide a therapeutic response during the ‘other 23 hours’.

Keywords: Take Two program, community services, children, abuse, neglect

Executive function in children and young adults: Experimental findings and practical implications

Chair(s): WHITE, M. (Centre for Accident Research and Road Safety and Institute of Health and Biomedical Innovation QUT)

Discussant(s): SHARMAN, R. (Institute of Health and Biomedical Innovation and School of Psychology and Counselling QUT)

The role of executive function in development is critical but poorly understood. Young people with decreased cognitive abilities, particularly executive function deficits, are at an educational and vocational disadvantage relative to their peers. Executive function is critical for the performance of many life skills. The development of executive function is delayed relative to other cognitive abilities, which may help to explain many of the behavioural idiosyncrasies of youth. However, in some groups, executive function follows a different developmental trajectory, one that might predispose some young people to developmental delays that may negatively impact social, educational and vocational outcomes and opportunities. This symposium will provide a snapshot of research investigating developmental cognitive dysfunction in children and young adults with a specific focus on executive function. The first study presents the results of an investigation into executive function deficits in children with phenylketonuria (PKU). The second study reports on the interactive influences of psychosocial stress and two genetic polymorphisms associated with reduced dopamine receptor density in the brain on behavioural measures of impulsivity in young adults. The third study presents data examining the impact of omega-3 polyunsaturated fatty acid and executive function deficiencies in children with ADHD. The final study examines the effect of anxiety on attentional control in cognitive and motor performance and proposes a framework for future investigations of anxiety on task performance. Each of these studies presents findings that will be informative for psychologists with an interest in factors thought to mediate executive development throughout childhood and young adulthood.

Executive function deficits in children with phenylketonuria, towards further understanding a dopaminergic basis

SHARMAN, R. (Institute of Health and Biomedical Innovation and School of Psychology and Counselling QUT), YOUNG, R. (Institute of Health and Biomedical Innovation)

Phenylketonuria (PKU) is a genetic disorder that causes altered biochemistry, resulting in downstream neurotransmitter dysregulation. Left untreated, this will result in severe intellectual disability and substantial white matter loss in the developing brain. Treatment via medically prescribed diet has seen this population develop normally in terms of standard IQ scores. However, children with early and continuously treated PKU remain at elevated risk of developing executive function (EF) impairments. Over 10 years ago, Diamond first proposed these residual impairments may result from a low dopamine environment in the developing brain, caused by a high phenylalanine to tyrosine (phe:tyr) ratio. Few experimental studies have followed up this hypothesis, as the research agenda remains focussed on phenylalanine-only measures. Further, the routine screening of tyrosine levels in these patients is highly variable. This study aimed to analyse children’s EF development longitudinally against their lifetime biochemistry to ascertain which biochemical markers were most strongly associated with poor EF across two critical time points in development (early childhood and early adolescence). 17 children with PKU were assessed in 2002 on a battery of neuropsychological tests. In 2009 these children were reassessed on a select number of tests that have since been shown to be particularly sensitive in detecting EF deficits in this population. In the 2009 study, parents also filled out two questionnaires assessing EF and mood (the Behaviour Rating Inventory of Executive Function and Children’s Depression...
Inventory); questionnaire data related to both children with PKU and their siblings in 2009 to allow for a between groups comparison. Both phenylalanine and phe:tyr ratio were shown to be associated with global impairments. A high phe:tyr ratio (a precursor to dopamine impairment) was more strongly associated with the residual EF deficits that remain problematic for this population. Current treatment for PKU centres around phenylalanine control; there may be another mechanism via the phe:tyr ratio leading to dopamine deficiencies that better accounts for residual EF deficits in this population. Future treatment may need to incorporate phe:tyr control to protect the developing brain. This research furthers our understanding of the possible dopaminergic basis of EF development.

Keywords: Phenylketonuria, biochemistry, dopamine, intellectual disability, executive function

Differential contributions of two dopaminergic genetic markers and environmental stress on behavioural phenotypes of impulsivity in young adults

WHITE, M. (Centre for Accident Research and Road Safety and Institute of Health and Biomedical Innovation QUT), MORRIS, P. (Institute of Health and Biomedical Innovation QUT), LAWFORD, B. (Institute of Health and Biomedical Innovation QUT)

To examine a potential genetic contribution to impulsivity that operates through dopamine, consistent with key assumptions of leading personality theories of impulsivity. Specifically, to examine the contribution of two common genetic polymorphisms, the DRD2/ANKK1 TaqIA and DRD2 C957T, which have previously been associated with reduced D2 dopamine receptor density in key brain reward areas and several clinical disorders of impulsivity. DRD2/ANKK1 TaqIA and DRD2 C957T genotyping was conducted on 72 healthy young adults who were randomly allocated to either an acute psychosocial stress or relaxation induction condition. Participants completed a self-report measure of chronic stress, a pre- and post-induction card-sorting index of reinforcement sensitivity and post-induction computerized response inhibition and delay discounting tasks. The TaqIA showed a direct association with response inhibition and with reinforcement sensitivity. Specifically, those with the A1 allele showed greater and faster disinhibition as well as slowed baseline reward-cued responding which improved over time, regardless of type of induction. In contrast, the C957T showed an interaction with acute stress on the reward-cued card-sorting and delay discounting tasks, whereby those with the CC genotype showed increased reinforcement sensitivity and faster delay discounting after acute stress induction, compared with those CC genotypes who were not stressed. Higher chronic stress exposure was associated with reduced baseline reinforcement sensitivity, and this reduction was of a similar magnitude to the TaqIA effect for this measure. These data provide indirect support for the involvement of dopaminergic systems in impulsivity in young adults through a genetic association. They highlight the multidimensionality of impulsivity and complexity of gene-stress interactions. The TaqIA appears to be associated with both a "rash impulsive" behavioural style and reinforcement-related learning deficits that are independent of stress. In contrast, C957T may be associated with reward related impulsivity in response to acute psychosocial stress.

Keywords: genetic contribution, dopamine, impulsivity, psychosocial stress, gene-stress interactions

An investigation of the effects of essential fatty acid deficiency on executive functions in children with Attention Deficit Hyperactivity Disorder (ADHD)

BOON, J. (Institute of Health and Biomedical Innovation and School of Psychology and Counselling QUT)

The aim of this study is to investigate those key executive functions felt to be the cornerstone of Attention Deficit Hyperactivity Disorder (ADHD) and co-morbid reading/writing disorders, namely, working memory, disinhibition and planning/organisation and their relationship to essential fatty acid deficiency in an ADHD population. 42 Male and 5 female participants between 6-13 years
agreed to participate in the study. Forty-two participants reported co-morbid literacy difficulties. Blood samples were collected from 92% of participants for analysis of essential fatty acid status. Participants completed performance and ecologically based psychological assessment tools including select items from the Test of Everyday Attention in children (TEA-ch), a computerised Continuous Performance Task, Spelling and Word reading sub-tests of the Wechsler Individual Achievement Test – II and Vocabulary sub-test from the Wechsler Intelligence Scale for Children – IV. Parents rated their child’s frequency of thirst, dry skin, and brittle nails on the Fatty Acid Deficiency Symptom Scale (FADS). Parents also completed the Connors Parent Rating Scale – Long Version (CPRS-L) and the Behaviour Rating Inventory of Executive Functions (BRIEF). Parents rated disinhibition on the BRIEF as the most problematic in this population. A correlation analysis showed a strong relationship between Parental reported symptoms of FADS with executive functions, in particular their ability to focus/attention and working memory skills. A weak relationship between blood biomarkers, organisation of school materials and focus/attention shifting was observed. A standard regression showed a significant relationship between spelling skills, vocabulary, ability to shift focus/attention and clinical indicators of fatty acid deficiency. Parental ratings of FADS, executive function checklists and young people’s performance on neuropsychological measures of executive functions can assist in identifying those children with ADHD most at risk to determine the appropriate course of treatment and intervention.

Keywords: executive function, attention deficit hyperactivity disorder, working memory, disinhibition, fatty acid deficiency

Effects of anxiety on young adults’ executive functioning: experimental results and practical implications in driving lapses

WONG, I. (Centre for Accident Research and Road Safety and Institute of Health and Biomedical Innovation QUT), MAHAR, D. (School of Psychology and Counselling QUT), TITCHENER, K.

Attentional failure has been reported by accident statistics and experimental studies to be a significant contributor to traffic crashes. Emerging research has highlighted the important influence psychological factors such as anxiety have on cognitive and motor performance. Given the overrepresentation of young adults in crash statistics and that the effortful attentive processing required in driving of this cohort due to inexperience, the aim of this study is to investigate the effects of anxiety on young adults’ executive functioning, and its potential implications for their driving performance, in particular driving lapses. 49 young adults aged between 17-25 years took part in the study. An additional 26 older adults aged between 26-47 years participated in the 1 hr experimental trial. All participants completed the Parametric Go/No-Go and n-back tasks, the State-Trait Anxiety Inventory and the Driver Behavior Questionnaire (DBQ). As anticipated, highly-anxious individuals maintain accuracy at the expense of response time for the inhibition, set-shifting as well as updating function of the Central Executive. Interestingly, the impairments in response times due to anxiety are especially pronounced amongst young adults. Further, compared to their older counterparts, young adults demonstrated significantly higher driving lapses scores on the DBQ. Finally, the deficit in response times on the Central Executive functions partially mediated the anxiety–driving lapses relationship reported in previous literature. Findings from the current study provide evidence to support the potential of Attentional Control deficits in accounting for the influence of anxiety on driving performance, especially among young adults. These findings have implications for future efforts to address the problem of traffic crashes due to attentional failure, especially amongst novice drivers, for whom driving remains an effortful task that requires deliberate attentive processing. Finally, the present study offers a novel perspective from cognitive psychology to the problem of the overrepresentation of young drivers in accident statistics.
Exploring positive adaptation to diverse challenges and developmental periods

Chair(s): SERLACHIUS, A. (The University of Melbourne)
Discussant(s): FRYDENBERG, E. (Graduate School of Education, The University of Melbourne)

This symposium presents data from a range of studies regarding positive adaptation in diverse populations and across several developmental periods. The first paper presents findings from a qualitative study of adolescents with type 1 diabetes, exploring adolescents’ views on an existing generic coping skills training program and how it can be adapted to meet their needs. The findings demonstrate the importance of providing skill-based psychosocial education in type 1 diabetes. The second paper investigates how to conceptualise the relationship of positive development to psychopathology using person-centred analyses in a sample of young adults. The data suggest that successful adaptation and psychopathology are not simply poles of a single continuum, and discusses implications for theory and intervention development. The third paper presents a community-based qualitative study which identified coping strategies of preschoolers, and their ability to identify a range of coping strategies across different situations. The data has implications for theory development and the development of prevention and intervention programs for preschoolers. The last paper is a pilot study implemented in a school context, which discusses the efficacy of a coping program for children who have learning disabilities. Post program qualitative findings indicate school-based interventions are most effective when they are thoroughly integrated into overall school priorities.

An exploration into the coping strategies of preschoolers: A descriptive study

CHALMERS, K. (The University of Melbourne)
A great deal of information can be gleaned from self-regulation, adolescent and adult coping literature, however, there is clearly a lack of research on the coping strategies of young children. This study addresses this knowledge gap by exploring the coping strategies in the early years, paving the way for the development of programs and interventions aimed at improving young children’s coping skills. Four-year-old children (n = 46) at an early learning centre in Melbourne were asked to describe their coping strategies when dealing with seven age-appropriate challenging situations. The interviews were recorded and transcribed for analysis. A mixed-method approach consisting of both quantitative and qualitative components was utilized in the study. Coping strategies were identified and clustered into productive and non-productive coping styles. Descriptive statistics were used to determine the frequency of coping strategies and styles used across seven situations, namely “separation from parents”, “friendship”, “making a choice”, “teacher”, “teasing”, “night fears” and “don’t like something”. The results indicated that preschoolers could articulate ten coping strategies across the seven situations. The coping strategies that emerged from the data, were “play/do something else”, “solve the problem”, “think positive”, “calm down”, “ignore the problem”, “seek comfort”,” “seek help”, “do nothing/don’t know”, “cry/can’t feel better” and “get angry”. The results also suggest that children use specific coping strategies for specific situations. The most frequently used coping strategy for the friendship, choices, and teasing scenarios was problem solving. Comfort seeking was mostly sought in the separation scenario and help was sought when children were faced with something they didn’t like. The capacity to identify a range of coping strategies related to specific situations has implications not only for theory development, but also for the design of effective prevention and intervention programs to help children more effectively deal with life challenges. This research highlights that previous studies have underestimated four year old children’s ability to understand and report their coping efforts and provides rich qualitative data from which quantitative measures can be developed to further understand the coping strategies of preschoolers.

Keywords: self-regulation, coping strategies, preschoolers, children’s coping skills, children’s coping skills

Coping with learning disabilities: a program for young adolescent students

FIRTH, N. (The Royal Children’s Hospital and The Murdoch Childrens Research Institute)

Specific learning disabilities (SLD) are associated with risk of negative outcomes (e.g., school dropout). Those who are successful despite SLD respond proactively. However young people who have SLD are at risk of giving up and developing disruptive behaviour and are likely to need explicit assistance in using adaptive coping strategies. This pilot study investigates the efficacy of a coping program for children who have learning disabilities implemented within a model of whole school change. The intervention involves a withdrawal coping program for Grade 6 students who have SLD, nested within a classroom coping program involving all Grade 6 students, which in turn nests within whole school SLD professional development and change. The 10 session coping program involves awareness of current coping strategies, use of positive thinking, assertion, goal setting and problem solving. The 10 (minimum) extra withdrawal sessions held for students with SLD focus the coping strategies onto SLD-related situations and include role modeling by successful adults who have SLD. One-hundred and two grade 6 students from two Australian government schools were involved in the study. Twenty-three students have been assessed as having SLD. Measures include student and teacher surveys, end of semester school reports, teacher interviews, and a field diary. Post program qualitative data suggests the efficacy of the coping program was influenced by: the priority given by the school to the program; class climate of the withdrawal SLD group; and strength of the connection between the universal and SLD withdrawal class coping program. Teachers reported the overall usefulness and age appropriate level of the content and presentation of both the universal and SLD
components. These initial results suggest the overall efficacy of the intervention and of the model of implementation that is being used. The results also suggest school-based interventions are most effective when they are thoroughly integrated into overall school priorities. Funding is currently being sought for a randomised controlled trial of the SLD coping program implemented using the above model.

**Keywords:** specific learning disabilities, disruptive behaviour, children, coping strategies, school-based interventions

**Adapting the best of coping program for adolescents with type 1 diabetes**

SERLACHIUS, A. (The University of Melbourne)

Adolescents with type 1 diabetes mellitus (T1DM) are faced with the usual pressures of adolescence, as well as the added demands of living with a chronic illness that requires strict adherence to the treatment regimen. Adherence to treatment generally declines in adolescence, putting teens with T1DM at increased risk for long-term health complications. Psychosocial interventions teaching coping skills can help adolescents improve their quality of life and glycaemic control (Grey et al; 2000). The objective of this project is to adapt and trial a generic coping skills program, the Best of Coping (BOC), with adolescents with T1DM. In this study, focus groups were held with adolescents with T1DM to assess usability of the BOC and to receive feedback on areas requiring modification. In order to adapt the program before implementation, four focus groups were held with thirteen adolescents aged 13-17 years with T1DM. The participants were recruited from the diabetes outpatients clinic at a paediatric hospital. The focus groups explored diabetes-specific stressors and coping strategies and also discussed the modules offered in the original program. The qualitative data were analysed using Thematic Analysis, according to the guidelines by Braun and Clarke (2006). The focus group data suggests that adolescents with T1DM are using a variety of productive and non-productive coping techniques to manage diabetes-specific stressors such as parent/adolescent conflict and complying with diabetes self-care behaviours. The feedback for adapting the program emphasised the need to incorporate self-management education, diabetes-specific information, and the use of online resources into the program. Across all four groups, participants expressed a strong desire to learn more about coping skills, and in particular how coping skills might be applied to enhance their diabetes self-care behaviours. Based on the qualitative data, important changes have been made to the program, in order to make the exercises and content more diabetes-specific. By participating in the adapted BOC, we hope that adolescents with T1DM will acquire coping skills adapted to enhance self-management, thereby influencing glycaemic control. The newly adapted program is currently being evaluated in a randomised controlled trial.

**The relationship between successful adaptation and psychopathology during the transition to adulthood: A person-centred approach**

O’CONNOR, M. (The University of Melbourne)

As part of the positive psychology movement, there have been calls for an increased focus on successful development and the factors that promote the potential for adaptive functioning in young people. The transition to adulthood represents a window of opportunity for positive change in life course trajectories, as well as a period in which the incidence of risk behaviors and mental illness is relatively high. Recently, a multidimensional model of positive development during the transition to adulthood (at 19-20 years) has been developed using Structural Equation Modelling. Five interrelated dimensions of positive development were identified, including social competence, life satisfaction, trust and tolerance of others, trust in authorities and organisations, and civic action and engagement. The current study aims to examine how best to conceptualise the relationship of positive development to psychopathology. We drew on data from 1,158 participants in the Australian Temperament Project, a large scale longitudinal community
based study, which has followed the development of a cohort of Australian children from infancy to young adulthood. The study has collected a wealth of data across 14 waves from multiple informants, including parents, teachers, and the children themselves. Cluster analysis revealed four underlying groups: thriving civic activists (high on all aspects of positive development including civic engagement, and low in psychopathology), thriving (high on all dimensions of positive development except civic engagement, and low in psychopathology), idling (low on all dimension of positive development, and average in levels of psychopathology), and distressed (low on all aspects of positive development except civic engagement, with high levels of psychopathology). The person-centred analyses revealed a degree of heterogeneity in the sample in how positive development and psychopathology relate. The results suggest that it is possible be low in successful adaptation, whilst being no higher than average in psychopathology, consistent with the view that ‘problem free does not mean fully prepared’ (Pittman and Fleming, 2001). Implications for model, theory, and intervention development will be discussed.

Keywords: risk behaviours, adaptation, development, psychopathology, Australian Temperament Project

**Faking, exaggerating, not really trying, deceiving, or lying? A malingering research update**

Chair(s): SULLIVAN, K. (Queensland University of Technology)

Malingering is the deliberate feigning or exaggeration of symptoms for external incentive. This phenomenon is of relevance to several areas of psychology, with a comprehensive literature of “faking-good” in organisational contexts, “faking-bad” in neuropsychological contexts, and a large body of work on the development and application of psychopathology “lie” scales. Because of its very nature it is difficult to know the extent of malingering. However, current figures suggest that in various compensation-seeking and litigious populations, malingering occurs in 11-64% of cases referred for neuropsychological assessment (Langeluddece & Lucas, 2004; Larrabee, 2003; Mittenberg et al 2002; Slick et al 2004; Sullivan et al 2007). Psychological studies have shown that the rate of malingering varies depending on: presenting diagnosis, assessment setting, referral type, and the method of detection that is used. The costs of malingering are high and these costs can impact a range of stakeholders including the general community via higher insurance premiums or job application costs, and genuine complainants who may not get the support they need because resources have been misdirected to those who are not in genuine need. Indeed, the failure to understand malingering and account for it in clinical practice threatens the integrity of our diagnostic procedures and undermines the credibility of the profession. If we can be tricked or deceived by exaggerated or fabricated psychological presentations, what safeguards are necessary to optimise clinical practice? This symposium will outline a model of malingering, discuss the ways in which we might use warnings to reduce malingering, and present an evaluation of a new test of malingering. The research presented in this
symposium will be of relevance to psychologists from a broad range of areas and will incorporate helpful recommendations for clinicians.

The ecological validity of the MMPI-2 Response Bias Scale

ELLIOIT, C. (Queensland University of Technology)

The Minnesota Multiphasic Personality Inventory-2 (MMPI-2, Butcher et al., 2001) contains several items found to reliably differentiate between individuals fabricating or exaggerating symptoms and those with genuine symptoms. These items comprise the MMPI-2 validity scales. The 28-item Response Bias Scale (RBS) is the first and only MMPI-2 validity scale created specifically to detect feigned cognitive impairment (FCI) (Gervais, Ben-Porath, Wygant, & Green, 2007). Four recent studies have investigated the RBS, however, only three of these were conducted independently of the development team, and of these studies, only one reported utility estimates (Gervais, Ben-Porath, Wygant, & Green, 2008; Larrabee, 2008; Nelson, Sweet, & Heilbronner, 2007; Whitney, Davis, Shepard, & Herman, 2008). Furthermore, this study relied on only one symptom validity test (SVT) to classify participants, which contravenes the standard usage in clinical practice of two or more SVTs in the detection of FCI (Rogers, 2008). The aim of this study was to address these limitations and provide an independent and rigorous investigation of the ecological validity of the RBS. 196 medicolegal archival cases were collected from a private neuropsychology practice in Brisbane. The cases were classified as honest responders or possible, probable or definite malingered neurocognitive deficit (MND) using Slick, Sherman and Iverson’s (1999) criteria. Scores on the Test of Memory Malingering (TOMM; Tombaugh, 1996), Warrington’s Recognition Memory Test (WRMT; Warrington, 1984), and all subtests of the Wechsler Adult Intelligence Scale-Third Edition (WAIS-III; Wechsler, 1997) were obtained. RBS scores were collated for each case from MMPI-2 results. Scores on the RBS were: (a) significantly higher in individuals classified as definite MND than the remaining groups, (b) significantly higher in individuals classified as probable MND than individuals classified as possible MND or honest responders and (c) significantly higher in individuals classified as possible MND than those classified as honest responders. The RBS utility estimates were similar to those calculated in the development study (Gervais et al., 2007). The results of this study support the use of RBS as an ecologically valid indicator of FCI.

The role of stereotypes in the generation of fake-job personality profiles

MAHAR, D. (Queensland University of Technology)

This research explored how stereotypes are used when faking personality tests in a vocational selection context. Experiment 1 was based on a new anchor-point approach to testing the strategies used by respondents when faking personality inventories and demonstrated that fake-job profiles appear to be based on the respondent’s stereotype of members of the target occupation. Experiment 2 confirmed that fake-job profiles are based primarily on stereotypes of members of the target occupation and also showed that respondents tend to omit negative aspects of their stereotype when faking. Experiment 3 extended this finding by looking at how several stereotypes (or schema) are used to produce fake-job profiles. It was found that job-stereotypes and fake-good schema were strongly represented in fake-job profiles, with both fake-bad and honest schema being represented less strongly. This pattern was found in two target occupations which differed in terms of whether or not the respondents were undertaking training for that occupation. Stereotypes seem central to the process of faking, and subsequent research should attempt to integrate this line of research with current theories of personal and social identity and to extend it to other types of faking like malingering.

Keywords: stereotypes, faking, personality tests, vocational selection, fake-bad
An investigation of the effectiveness of warnings against malingered psychopathology

SCHENK, K. (Queensland University of Technology)

Malingering causes substantial social, legal, health and economic impacts. Whilst malingered neuropsychological deficits in litigious populations appear most prevalent (Greiffenstein, Baker, & Gola, 1994), investigations of the extent of faked psychological disorders, also suggest malingering is prevalent (i.e., Mittenberg et al., 2002; Gervais, Green, Allen, & Iverson, 2001; Strong, Green, & Schinka, 2000). It is estimated that approximately 3%-4% of all individuals who are psychiatrically assessed in Australia, are probably malingering (Sullivan et al., 2007). Malingering research to date has mostly focused on the construction and validation of detection methods (e.g., Franzen, Iverson, & McCracken, 1990; Meyers & Vollbrecht, 2003; Schretlen, 1988) with relatively little research into potential deterrents. This is problematic as attorneys have reported spending time preparing clients for test-taking and some provide information pertaining to psychometric test validity scales (Victor & Abeles, 2004; Wetter & Corrigan, 1995) which undermines the detection capabilities of malingering tests. This underscores the need to develop malingering deterrents in parallel with research on detection methods. This study utilised a deterrence theory framework to examine the effects of warning simulators against malingering on measures of personality and psychopathology. Deterrence theory predicts that the most efficacious warnings are likely to be those that elicit subjective cost-benefit analyses and assessments of sanction certainty, severity and celerity from potential malingerers (Pogarsky, Piquero, & Paternoster, 2004; Williams & Hawkins, 1986). 67 first-year psychology students were randomly allocated to one of three conditions: Unwarned malingers, warned malingers or controls. Participants in the two malingering groups were given a financial incentive to simulate believable psychological impairment. Warned malingerers received an additional warning that the tests could detect malingering and that detection would result in a loss of course credit for their involvement in the study. Controls were given standardised test performance instructions with no warning or incentive. It was hypothesized that the malingering incentive would be sufficient to induce malingering, but that a deterrence theory warning would have a subsequent deterrent effect. Using a between-groups simulation design, group differences on the clinical scales of the Personality Assessment Inventory (PAI) and the revised Symptom Check-list 90 (SCL-90-R) were assessed. Results demonstrated that warnings significantly altered test performance, such that warned malingerers scored significantly lower (faked less) than unwarned malingerers on the majority of the psychopathology scales and frequently approximated control group performances. Qualitative results revealed that the large majority of potential malingerers decided not to malinger based on the deterrent warning whilst only a small minority were motivated to become more sophisticated malingerers. These results support the effectiveness of a warning to complement existing malingering detection methods.

Keywords: malingering, neuropsychological deficits, faking, psychological disorders, personality

Malingering deterrent warnings: A new theoretical approach

KING, J. (Queensland University of Technology)

The clinical utility of warnings to deter potential malingering has been fiercely debated. Although the possible benefit of deterring clients from malingering by warning them about the possibility of detection has been demonstrated, potential disadvantages have also been suggested, including the possibility that such warnings may produce more subtle and harder to detect exaggeration. The present study aimed to operationalise the principles of deterrence theory to examine the impact of warnings of varying severity on simulated performance, in order to better understand whether warnings may be helpful in a neuropsychological assessment context. 78 participants were randomly assigned to a control group, an
unwarned simulator group, or one of two warned simulator groups. The warning groups comprised low- and high-level conditions depending on warning intensity. Simulator participants received no coaching about how to fake tests. Outcome variables were scores derived from the Test of Memory Malingering and Wechsler Memory Scale-III. Significantly fewer simulator participants in the high-level warning group malingered than in the unwarned group. Warned groups were then divided into those who reported malingering and those who did not report malingering, and the performance of these groups was compared to that of unwarned simulators and controls. Using this approach, results showed that participants who were deterred from malingering by warning performed no worse than controls. However, on a small number of tests, self-reported malingerers in the low-level warning group appeared less impaired than unwarned simulators. This pattern was not observed in the high-level warning condition. Partial support for both propositions was found; namely, that warnings may deter malingerers but that they may also make faking harder to detect. Although the group size was small in some of the follow-up analyses due to the impact of the warning on fully deterring participants from malingering, these findings suggest that a theoretically appropriate warning may have clinically useful deterrent results. This research contributes a new methodology for examining the impact of different warnings against each other to determine what factors may be clinically useful and what factors may actually harm the validity of clinical results.

**Keywords:** malingering, exaggeration, deterrence theory, performance, neuropsychological assessment

**Towards a new model of successful faking**

GRIEVE, R. (Queensland University of Technology)

Existing literature has failed to find robust relationships between individual differences and the ability to fake psychological tests, possibly due to limitations in how successful faking is operationalised. In order to fake, individuals must alter their original profile to create a particular impression. Currently, successful faking is operationalised through statistical definitions, informant ratings, known groups comparisons, the use of archival and baseline data, and breaches of validity indexes. However, there are many methodological limitations to these approaches. This research proposed a three component model of successful faking to address this, where an original response is manipulated into a strategic response, which must match a criteria target. Further, by operationalising successful faking in this manner, this research takes into account the fact that individuals may have been successful in reaching their implicitly created profile, but that this may not have matched the criteria they were instructed to fake. Participants (N=48, 22 students and 26 non-students) completed the BDI-II honestly. Participants then faked the BDI-II as if they had no, mild, moderate and severe depression, as well as completing a checklist revealing which symptoms they thought indicated each level of depression. Findings were consistent with a three component model of successful faking, where individuals effectively changed their profile to what they believed was required, however this profile differed from the criteria defined by the psychometric norms of the test. One of the foremost issues for research in this area is the inconsistent manner in which successful faking is operationalised. This research allowed successful faking to be operationalised in an objective, quantifiable manner. Using this model as a template may allow researchers better understanding of the processes involved in faking, including the role of strategies and abilities in determining the outcome of test dissimulation.

**Keywords:** faking, psychological tests, successful faking, depression, individual differences

**Malingering detection: From theory to practice**

ANDERSON, D. (Private Practice)

The aim of this paper is to present an overview of recommendations for evaluating malingering in the neuropsychological assessment context. Clinical research relevant to clinical practice, with an emphasis on test performance, will also be reviewed. The method involved an overview of current
literature in relation to test selection and interpretation, including both measures developed specifically to detect malingering (e.g.: SIMS) and application of other tests to this process (e.g.: Rarely Missed Index using items from Logical Memory Recognition). Issues will be explored both in relation to clinical presentation of complaints as well as formal test performance. Clinical case examples will be used to illustrate. Results suggest that a combination of tests and knowledge of the research literature provide optimal, but imperfect, clinical detection. Recommendations will be presented for clinical practice, based on current research.

Keywords: malingering, neuropsychological assessment, test performance

Families of children with disabilities: Current conceptual and research trends

Chair(s): REECE, J. (RMIT University)

Our knowledge about families of children with disabilities and chronic illness has greatly evolved over the last 20 years. Earlier models emphasized deficit oriented perspectives, which largely focused on the child’s disability and parental pathology to explain the challenges experienced by these families; while contemporary studies have adopted more ecological, systems, and strengths-based approaches. Indeed, much attention is now provided to the examination of individual psychological well-being as well as that of various family subsystems including parent, sibling and parent-child dyads, acknowledging the systemic and dynamic nature of family life over the life span. Furthermore, the study of variables has expanded to include influences outside the family such as community and service-oriented factors, which are currently understood to have an impact on the adjustment of family members. In studying this population of families, empirical findings which inform the design of effective interventions and supports is ultimately of critical importance. Research methodologies that promote the development of explanatory models for family well-being and interventions are therefore more complex, incorporating mixed methods and sources of information other than the individual family members themselves. Taking into consideration these perspectives, the aim of the proposed symposium is to report on a series of studies that address variables associated with the well-being of and intervention with family members. Key learning objectives include: Increase delegates’ knowledge of contemporary conceptual frameworks and empirical findings generated by various studies of family of children with disabilities and chronic illness in Australia; Increase delegates’ understanding of research methodologies currently used in explaining psychological well-being and
informing the design of interventions in families of children with disabilities and chronic illness; and increase delegates' knowledge of proposed research directions in the study of families of children with disabilities and chronic illness.

The wellbeing of siblings of children with a disability or chronic illness in Australia

GIALLO, R. (Parenting Research Centre)

There has been growing interest in the wellbeing of siblings of children with a disability or chronic illness both in Australia and internationally. International research indicates that although most siblings are well adjusted, some do experience significant wellbeing or adjustment problems (Lamorey, 1999; Rossiter & Sharpe, 2001; Summers et al. 1994). The aim of this paper is to report on the wellbeing of siblings of children with a disability or chronic illness in Australia. A total of 133 families were recruited from a range of service providers across Australia. Parents reported on the wellbeing of siblings (aged 8-17 years) of children with a disability or chronic illness using the Strengths and Difficulties Questionnaire (Goodman et al., 1998). Results revealed that siblings had significantly higher ratings on the Total Difficulties, Conduct Problems, Hyperactivity, and Peer Problems subscales compared to Australian normative data (Mellor, 2005). Siblings also had significantly lower ratings on the Prosocial subscale. Approximately 16% of siblings scored in the clinical range on the Total Difficulties subscale. No demographic or disability or illness related characteristics were associated with sibling wellbeing. These findings highlight that a small proportion of siblings of children with a disability or chronic illness are at risk of adjustment difficulties. Further work is needed to understand why some siblings are at risk, and what is important in helping them to adjust as they grow and develop. The significance of these findings for the provision of sibling support and for professionals working with families of children with a disability or chronic illness will be discussed.

Keywords: well-being, children, disability, chronic illness, siblings

The psychological well-being of siblings of children with disabilities: The role of the family and the wider social community

DAVIS, K. (RMIT University)

Siblings of children with a disability are faced with ongoing challenges that have the potential to impact on their adjustment and well-being (Ross & Cuskelly, 2006; Stoneman, 2005). Given the increasing emphasis on promoting positive outcomes in siblings of children with disabilities, the overall aim of the current study was to identify the extent to which factors from within the family and the wider community contribute to the psychological adjustment of this population. A mixed method research design was used in this study. The sample was recruited from several early childhood intervention programs and special schools across metropolitan Melbourne, Australia. A total of 79 families participated, with siblings aged between 8 and 16 years. A control group was also recruited in order to account for differences on the outcome measures of adjustment (Strengths and Difficulties Questionnaire and Beck Self-Concept Inventory). Sibling adjustment was found to be associated with variables across individual (sibling temperament, sibling’s perceived feelings of connectedness), family (family functioning) and wider social community levels. Adjustment and well-being was shown to be related to greater feelings of connectedness (Loneliness and Social Dissatisfaction Questionnaire), healthy family functioning (as measured by the Family Assessment Device), parental well-being (Depression, Anxiety, Stress Scale), and a lower frequency and intensity of daily hassles (e.g., my brother or sister does embarrassing things; my brother or sister draws attention to us). Findings will be discussed in terms of the present study’s contribution to identifying the strongest predictors of sibling well-being, and the importance of this information in guiding best practice for positive family outcomes within families of children with disabilities. Findings and implications for practice will also be discussed in terms of the importance of incorporating a broader approach to intervention which focuses not only on the
needs of the child with a disability, but also other family members including siblings.

Keywords: siblings, children, disability, well-being, psychological adjustment

Factors affecting parental fatigue among parents of children with special needs.

SLATER, B. (University of Ballarat)

Fatigue is a commonly reported problem for parents of young typically developing children. It has been associated with wellbeing problems such as depression, and parenting outcomes such as less parenting warmth and involvement (Parenting Research Centre, 2008). Fatigue has recently been demonstrated to impact parents of typically developing children in regard to parenting, sleep, parental wellbeing, support needs and coping. There is currently no research investigating the relationship between parental fatigue, wellbeing and parenting for parents raising a child with either disabilities or chronic illness (hereafter referred to as special needs). Therefore, the aim of the study was to investigate fatigue in parents raising a child with special needs. It is anticipated that the findings from this study will guide best practice and inform future research targeting families of children with special needs. The paper was a survey study. 99 parents’ (mainly mothers) raising a child (aged 2 – 15 years) with special needs reported on their fatigue and wellbeing in addition to demographic factors, child, family and parental factors, such as appraisal and personal factors and coping. Parents reported high levels of fatigue in addition to depression, anxiety and stress. A range of demographic, child, family and parent factors associated with fatigue were also identified. Results indicated that parental fatigue was associated with problems in physical and daily functioning. The majority of parents reported hassles including poor sleep, time constraints for tasks and self, constant monitoring of their child, in addition to worry about their child’s future. Coping strategies described included talking, social contact and respite. Parents reported requiring help as a result of being tired and fatigued. The findings of this project contribute to knowledge about the wellbeing of parents raising a child with special needs. It is one of the first studies to examine the relationships between fatigue, wellbeing, and parenting. The results will inform the development of interventions and supports to promote the wellbeing of parents of children with special needs, particularly in the management of fatigue.

Keywords: fatigue, children, well-being, coping, special needs

Developing interventions for families of young children with disabilities in community settings

GAVIDIA-PAYNE, S. (RMIT University)

Interventions for families of young children with disabilities have generally been guided by those developed for their counterparts without disabilities. Existing studies documenting such interventions address children’s behavioural outcomes and parenting skills as implemented in clinical settings. Recent literature (Maul & Singer, 2009; Moes & Frea, 2002), however, suggests that the intervention focus needs to be broadened to include positive, alternative outcomes for children and families, as well as outcomes for practitioners from disciplines other than psychology who are charged with the delivery of such interventions in the community. Thus, the aim of this paper is twofold: (1) to report on the associations between practitioner competencies, children’s social and behavioural characteristics and family well-being; and (2) to report on preliminary results of a community-based intervention, which incorporates these earlier findings. 64 families of young children (M = 52 months) with a developmental delay or disability were recruited from early childhood intervention programs in Victoria, Australia. A series of measures were used to assess parental reports of family quality of life, professional and social support, and child related hassles (i.e., behaviour problems). The community-based intervention study consisted of a smaller sample of families of young children with disabilities, focusing on two specific measures of parental stress and parenting sense of competence. Practitioner help-giving styles were the strongest predictors of family quality of life and parental well-being, whereas child hassles were significantly
associated with parental well-being. A pre-post study design for the community-based intervention yielded significant decreases in parental hassles, but not for general parent stress. No significant changes in parenting sense of competence were observed. Findings of the present study suggest that a range of child, family and practitioner variables are associated with child and parent outcomes in families of young children with disabilities. Additional research is required to tease out the differential effects of these variables and their contribution to the effectiveness of interventions for this population.

Keywords: children, disability, disability, family, social support

From data to practice:
Translating empirical research into useful clinical outcomes in mental illness

Chair(s): ROSSELL, S. (Monash University)
Discussant(s): KULKARN, J. (Monash University / Alfred Hospital)

Funding bodies, researchers and clinicians all recognize the need for translating empirical research findings into clinical practice. Despite our best intentions this goal is not always achieved with many clinicians still in the dark with regards to the large array of research published. This symposium aims to bring together lead research scientists and senior clinicians to discuss four chronic mental illnesses: schizophrenia, anorexia, body dysmorphic disorder and depression. Each condition will be briefly introduced, followed by a description of some of the latest and most significant research findings; this will be concluded by a discussion on the importance of this research to clinical practice. The researcher and clinician will have worked closely together to produce this presentation of material. This symposium will be engaging for both researchers, clinicians, consumers and policy makers. It will improve communication between these disciplines. It will assist clinicians with knowing how to find and interpret evidence based research. Lastly, it will assist researchers in understanding the barriers present in translating research findings into clinical outcomes.

Schizophrenia

THOMAS, N. (Alfred Hospital), ROSSELL, S. (Monash University)

To discuss the implications of current cognitive and neuroimaging research on psychological interventions for schizophrenia, using the example of auditory hallucinations.
Developments in the cognitive neuropsychological understanding of auditory hallucinations are reviewed, and considered in terms of their implications for the development of psychological interventions. Cognitive models have evolved from conceptualizing auditory hallucinations in terms of inner speech, arising from faulty source monitoring. This explanation has been further characterized and has been shown to have a sensory perceptual origin. Neuroimaging evidence has confirmed abnormalities in the auditory cortices that relate to this deficit. Psychological interventions have been developed for people with persisting auditory hallucinations using principles of cognitive behavioural therapy. However, psychological interventions to date have mainly aimed to improve coping and reduce distress associated with hallucinations, rather than targeting a reduction in hallucinations themselves. Greater precision in our understanding of the underlying cognitive deficits provides a new direction in the reduction of the frequency of hallucinations as well as their impact.

Keywords: neuroimaging, psychological interventions, schizophrenia, auditory hallucinations, cognitive behavioural therapy

Anorexia

MOUNTJOY, R. (La Trobe University), BOSANAC, P. (University of Melbourne)

Anorexia will be briefly introduced, followed by a description of some of the latest and most significant research findings; this will be concluded by a discussion on the importance of this research to clinical practice. Recent developments in the understanding and treatment of anorexia nervosa (AN) and their translation to clinical and population-based care in the Australian context are presented. The available evidence-base and the gaps are overviewed. Overall, there is a paucity of high-quality research into treatments for AN, albeit that a number of biological and psychological interventions show promise as avenues for further research. There are significant impediments to provision of comprehensive longitudinal care for people with AN within Australian mental health services. Evaluation of novel strategies such as home-based support is required as part of enhancing options for Australians suffering with AN and their families. There is a gap between clinical practice guidelines and what is readily available and accessible, including the transition from acute medical and/or psychiatric care to ‘stepped-care’. Whilst population-based approaches such as CEED in Victoria, the Centre for Eating and Dieting Disorders in NSW and school-based prevention programs have commendably been implemented, they require longer term evaluation from a variety of stakeholders’ perspectives, including patient, carers, clinicians and healthcare service providers. Although a number of psychological interventions, particularly the Maudsley model, appear to be bearing therapeutic fruit and pharmacological research avenues continue to be explored, the challenge for clinicians and healthcare services is to provide care for AN patients amidst a fledging evidence-base. Moreover, the challenge for clinicians and healthcare services is to provide consistency, continuity and quality of care for AN patients, given their inherent difficulties in engaging with health services and their potential ‘slippage’ into potential gaps in the continuum of care, particularly following transition from inpatient care. Although inpatient management of AN should probably be confined to dealing with medical risk, further exploration of day-based and intensive home-based care models is urgently required, if we are to establish the optimal continuum of specialist care for AN patients in Australia.

Body Dysmorphic Disorder

TOH, W. (University of Melbourne), CASTLE, D. (St Vincents Health)

To discuss how current cognitive and neuroimaging research into body dysmorphic disorder (BDD) has informed existing nosological debates and shaped clinical applications. Existing knowledge relating to the range of cognitive deficits and neurobiological anomalies observed in BDD are reviewed, and
considered in terms of its psychiatric classification as well as pharmacological and/or psychological interventions for the disorder. Available research has uncovered a range of cognitive deficits underlying BDD, especially in the areas of executive function, social information processing, and facial emotion perception. Two cognitive mechanisms: (i) selective attentional biases, and (ii) anomalies in basic visual processing, have been hypothesised as underlying the etiology and maintenance of the disorder. In addition, there appears to be a sound rationale for considering BDD as part of the obsessive-compulsive spectrum disorders (OCSDs), and the degree of delusional beliefs involved would be more appropriately theorised on a dimensional basis. These findings have significant implications for the clinical management of BDD. Further research is necessary to elucidate an inclusive profile of the underlying cognitive deficits in BDD. These insights could in turn help to clarify current nosological debates and direct future treatment approaches.

Keywords: neuroimaging, body dysmorphic disorder, cognitive deficits, neurobiological anomalies, treatment

Depression

HOY, K. (Monash University), FITZGERALD, P. (Monash University)

To present the latest research into novel therapies for Treatment Resistant Depression (TRD), and discuss both the imminent and future clinical implications of this research. Treatment resistant depression is a considerable clinical problem, and to date there are only limited treatment options. We will review the latest attempts at developing effective and safe treatments for this population, in particular we will discuss the growing field of neuromodulation in psychiatry. Electroconvulsive therapy (ECT) is currently the only established treatment for TRD, but its use is complicated by the production of cognitive side effects. Over the last 20 years, a variety of brain stimulation techniques have been developed with the aim of producing effective clinical tools with minimal cognitive side effects. There has been considerable improvement to ECT itself in an attempt to reduce cognitive side effects, a resurgence of interest in transcranial Direct Current Stimulation (tDCS), the development and refinement of Transcranial Magnetic Stimulation (TMS), the introduction of invasive brain stimulation into psychiatry (Deep Brain and Epidural Cortical Stimulation, (DBS, EpCS), and the emergence of Magnetic Seizure Therapy (MST). A substantive body of research is now emerging on the development and refinement of a range of old and new brain stimulation techniques that may be applied in depression treatment. While the exact place of many of these techniques in the spectrum of treatments for depression is as yet unknown, research that aims to ultimately provide clinicians and patients with evidence based treatment choices continues.

Keywords: treatment resistant depression, treatment, electroconvulsive therapy, cognitive side effects, brain stimulation techniques
Future directions for the assessment and treatment of autism and Asperger's disorder

Chair(s): RINEHART, N. (Monash University)
Discussant(s): TONGE, B. (Monash University)

Pervasive Developmental Disorders (PDDs) are arguably the most serious child onset neurodevelopmental conditions. The main forms of PDD are autism and Asperger’s Disorder (AD). PDDs are characterised by social-communicative impairments together with stereotyped, restricted or repetitive behaviours or interests, and neuromotor impairments. The first three papers in this symposium will outline cutting-edge neurobiological human and animal experimental approaches which have the potential to lead to radical treatments for the core social-communicative symptoms of PDDs (Transcranial Magnetic Stimulation, Oxytocin, and a potential autism mouse model). All three of these approaches involve neurobiological interventions which directly or indirectly modulate fronto-striatal-cerebellar brain systems. The final two papers will describe findings from two novel techniques (3D motion analysis and ocular motor analysis) which are being used to non-invasively probe brain dysfunction in children with autism and AD. It is argued that the identification of unique ‘neuromotor signatures’ may lead to improved differential diagnostic testing procedures for autism and AD (Rinehart et al, Nature Clinical Practice Neurology, 2007). The ocular motor and gait data show that individuals with autism exhibit a distinct combination of cerebellar and fronto-striatal basal ganglia related movement disorders, while the movement disorder associated with AD is predominately associated with fronto-striatal basal ganglia disruption. Recent neuroimaging evidence (McAlonan, Psych. Med. Jul., 2009) supports the hypothesis that autism and AD are associated with differential brain abnormalities. The five research areas presented in this symposium are currently funded by the Australian National Health & Medical Research Council. This symposium has three key learning objectives; To describe the foundation for the future generation of (1) neurobiological interventions and (2) clinical and neuromotor methods for assisting in the diagnosis of autism and AD. The third objective is to use current empirical data about the neurobiological and neurobehavioural separateness of autism and AD as a platform for discussing the proposal for DSM-V to drop the diagnostic category of ‘Asperger’s disorder’.

Oxytocin as a treatment to improve social functioning in autistic youth

FIELDING, J. (Monash University)

Recent developments in the field of neuroscience suggest the hormone and neuropeptide Oxytocin has a key role in human social behaviour. Laboratory data demonstrates that the administration of oxytocin nasal spray improves face perception, social memory, and performance on empathy tasks in non-clinical samples. Research is now growing to demonstrate a link between oxytocin and some of the social problems found in Autism Spectrum Disorders. Oxytocin may represent a radical new treatment hope to improve some of the socio-emotional difficulties observed in autistic spectrum populations. We present randomized controlled trials of oxytocin nasal spray to enhance social cognition, emotion perception, and social behaviour in youth with an Autism Spectrum Diagnosis. Results of these trials will be presented and implications to treatment and future research will be discussed.

Keywords: oxytocin, autism spectrum disorder

Transcranial magnetic stimulation in autism spectrum disorders: Mirror neurons, social cognition, and theory of mind

GUASTELLA, A. (University of Sydney)

Impairments in ‘social relating’ form the hallmark of autism spectrum disorders (ASD). Underlying neuropathophysiology, however, is largely unknown, thereby limiting the development of effective treatments. Transcranial magnetic stimulation (TMS), a
non-invasive means of stimulating the cortex via the administration of magnetic pulses, can be used to both investigate and modulate brain activity. Our current research uses TMS to (a) investigate the brain-basis of social cognitive deficits in ASD (via studies of the “mirror neuron system”) and (b) determine whether TMS can be used to improve theory of mind in ASD. Individuals with ASD and matched controls (age: 14-40) underwent a TMS experiment designed to measure mirror neuron activation while observing goal-directed, social, and socio-emotional behaviours. Participants also completed measures of social cognition (e.g., facial affect processing, empathy). In a separate study, adults with ASD completed a clinical trial in which daily TMS treatments were administered to the medial prefrontal cortex for a two-week period. Participants received either the active treatment or a placebo form of TMS. Measures of social relating and theory of mind were administered before the first treatment, after the last treatment, and one-month after the last treatment. Participants with ASD displayed evidence of reduced mirror neuron activation when viewing goal-directed movements. During socio-emotional stimulus presentations, however, participants with ASD displayed a level of cortical excitability comparable to controls, suggesting intact mirror neuron activity when viewing this behaviour. Deep rTMS, meanwhile, appears to hold promise for the treatment of social impairments in ASD. ASD is associated with reduced mirror neuron activation when viewing biological motion in a neutral setting. This study demonstrates, however, that there may be some instances where a seemingly appropriate mirror neuron response can be elicited in ASD; specifically, a socio-emotional component appeared to resonate with sensorimotor systems equally well in each group. The link between mirror neuron activation and aspects of autism appears to be extremely complex, and there may be broader neurocognitive and neurophysiological processes involved. This research furthers our neurobiological understanding of ASD, but also provides exciting new directions for the development of neurobiological treatments for social impairments.

Keywords: transcranial magnetic stimulation, autism

Testing the "Extreme male brain theory"

ENTICOTT, P. (Monash University)

The ‘extreme male brain’ was first suggested by Hans Asperger in 1944 when he first described the presentation of Asperger Disorder. Almost 60 years later, Baron-Cohen proposes that the behaviours of Autism Spectrum Disorder are an exaggeration of typical sex differences and proposed the “Extreme Male Brain Theory”. Arguing that males and females empathize differently, Baron-Cohen and associates have suggested that ASD is linked with sexual dimorphism by this difference in empathy and that exposure to high levels of prenatal androgens might cause this exaggeration. Indeed, patients with ASD have higher serum androgen levels. However, neural mechanism(s) through which androgens may act to cause this difference are not understood. We will describe a mouse model with hormonal disturbances which would be a useful tool to test this hypothesis.

Keywords: extreme male brain, asperger, androgens

Gait in children with autism and Asperger's disorder

BOON, W. C. (Florey Neuroscience Institutes)

Clinical descriptions and research evidence shows that individuals with autism and Asperger’s disorder (AD) often have subtle gait or postural abnormalities. Examination of motor function may help to define if these disorders are on a symptom continuum, or are distinct. The aim of this study was to use three-dimensional gait analysis to quantify and characterise the full-body kinematic features of gait associated with high functioning autism (HFA) and AD. Three-dimensional gait data were captured from typically developing children (TD, n = 15) (10.4 ± 1.6 years), a group with high functioning autism (HFA, n = 15) (9.8 ± 2.0 years), and a group with AD (n = 15) (10.1 ± 1.5 years). Participants completed 5 walking trials at (i) preferred, (ii) fast and (iii) slow walking speed. A biomechanical model
calculated joint kinematics and spatio-temporal (ST) measures. Kinematic variables of interest included peak values and range of motion (ROM) of the upper limbs, trunk and lower limb joints and the centre of mass (COM), and within-subject step-to-step variability of the kinematic and ST data. Preliminary analysis found the AD group walked with a significantly wider base than the TD group. Stride length variability differed at preferred speed, with increased variability in the HFA group. Both clinical groups had significantly increased COM ROM (an ‘up and down’ motion of the body) relative to the TD group at all speeds, with the HFA group also significantly increased relative to the AD group in the preferred and fast walking conditions. In all speed conditions, groups differed in the variability of almost all upper and lower body kinematics. Definitive results from an updated analysis of a larger sample ($n \approx 100$) will be presented at the symposium. These preliminary findings are consistent with certain clinical observations of HFA and AD gait and support previous studies suggesting that upper body kinematic abnormalities may be key features that distinguish the subtle gait impairments in both disorders. Emerging data suggests that kinematic analysis at varied speeds may identify gait differences between these groups.

Keywords: Gait, children, autism

Eye movements in children with autism and Asperger's disorder

MCGINLEY, J. (Murdoch Childrens Research Institute)

The aims of this preliminary investigation were to use ocular motor technologies to: (1) profile and contrast ocular motor deficits in autism and Asperger’s Disorder (AD); (2) investigate whether the neurobiological underpinnings of autism and AD are different, supporting their clinical separateness as defined in the DSM-IV-TR; (3) increase our understanding of the functional integrity of cerebellar and fronto-striatal systems in these disorders. These aims were addressed collectively, by using a battery of eye movement protocols to explore and compare the integrity of saccadic and smooth pursuit eye movement in young individuals with high functioning autism (HFA), AD, and age and IQ-matched controls (10-18 years, IQ > 70). Differentiation of performance derived from an evaluation of ocular motor characteristics thought to reflect disruption to fronto-striatal and cerebellar systems. For eye movements, fronto-striatal dysfunction is characterized by impaired initiation/facilitation of movement, and poor inhibition of extraneous/inappropriate movement. Conversely, cerebellar dysfunction is characterized by alterations to the velocity profile of movements, including skewed waveforms and impaired saccade main sequence (peak velocity/amplitude relationship), as well as trial-to-trial variability. Disruption to each of these systems was predicted in HFA, but primarily to the fronto-striatal system in AD. The range of differences revealed between control and HFA and AD groups indeed suggest that the neurobiological underpinnings of these disorders may be differentially disrupted. While cerebellar and fronto-striatal deficits were clearly evident across all tasks, the profile of deficits found was markedly dissimilar for HFA and AD groups. This preliminary investigation suggests that dissociation of motor deficits is possible in autism and AD using ocular motor techniques. Importantly, there are a number of advantages to using eye movements as a research tool. As well as being easily accessible to clinical observation and analysis, the eyes exhibits a restricted range of movement, lack inertia, and move against an unchanging mechanical load. Movements are highly stereotyped and reproducible in response to specific stimuli, and the neural systems controlling eye movements have been extensively investigated, permitting insights into patterns of abnormality that provide important clues about the location of neuropathology.

Keywords: Eye movement, autism, asperger
Gambling: Examining the influence of culture and age on behavior

Chair(s): MOORE, S. (Swinburne University of Technology)
Discussant(s): LADOUCEUR, R. (Université Laval)

Gambling is a popular pastime in many countries, but can cause problems for significant proportions of gamblers, particularly regular gamblers. As such, gambling has become an area of research interest within psychology in an attempt to inform theory and clinical practice. However, the majority of research has examined adult Anglo-Europeans. This symposium will report on new research into gambling behaviors of two under-examined, but potentially vulnerable, groups: The young and those from culturally and linguistically diverse (CALD) backgrounds. Paul Delfabbro from the University of Adelaide will commence, citing new longitudinal research with young gamblers within the existing literature. He will particularly report on the diversity and stability of gambling habits in adolescents, showing that adolescent gambling is not a good predictor of later gambling behavior. Keis Ohtsuka from Victoria University will then discuss research into cultural influences on gambling cognitions around luck and winning. He will show that definitions of luck align with a variety of irrational cognitions including obtaining favourable outcomes for decisions, hubris associated with winning and gambler’s fallacy. Susan Moore and Anna Thomas from Swinburne University will then combine the discussion of youth and CALD influences, examining risk factors for excessive gambling among international and local university students. Susan Moore’s research finds international students gambled less frequently than local students but experienced higher rates of gambling problems. Gambling problems were associated with a range of academic, relationship, financial and acculturation-related stressors. Anna Thomas extends this research, examining the applicability of a stress-motivation process model of problem gambling. Her research finds better support for the model in international students compared to locals. Professor Robert Ladouceur from Université Laval (Canada) will act as discussant for the symposium. The key learning objectives of this symposium are: (1) Insight into the stability and diversity of gambling behavior in adolescent and young adult gamblers; (2) Understanding of cultural influences on gambling cognitions around luck and winning; (3) Consideration of the impact of stressors on gambling behavior in university students across different CALD groupings; (4) Understanding of the combined effect of stress, socio-cultural adaptation, motivation, social support and help seeking on gambling behavior in different cultural groups.

Using longitudinal analysis to elucidate the stability of gambling in young people

DELFABBRO, P. (University of Adelaide)

Although numerous cross-sectional studies have been conducted to examine the prevalence of gambling and problem gambling in populations of young people, there is growing interest in the importance of using prospective longitudinal studies to examine the stability of gambling patterns as well as the relationship between adolescent and adult gambling. For example, do young people who gamble at one point in time continue to do so in the future? To what extent does adolescent gambling place young people at risk of gambling-related problems as adults? This paper reviews the existing international research evidence relating to longitudinal gambling patterns in people aged < 30 years with a particular focus on under-aged gambling. Included in this paper will be a discussion of the methodological strengths and weaknesses of different forms of longitudinal design as well as findings from two recent South Australian studies. The first of these studies described involves an analysis of the gambling habits of 578 young people who were tracked for four years from mid-adolescence (age 15 years) into adulthood (18-19 years) with standardised participation data collected every year. Another study involves a sample of young people aged 16-17 years recruited randomly through a telephone survey in 2005.
and tracked for 3 years thereafter. Both of these studies involve prospective longitudinal designs and standardized measures of gambling participation and pathological gambling. Study One showed how gambling patterns in young people are subject to considerable individual variability. Adolescent gambling at age 15 is not a strong predictor of adult gambling. Gender differences in gambling preferences observed during adulthood are also observable during adolescence, although these differences become more distinct over time. Study Two showed that pathological gambling during adolescence is not a reliable predictor of problem gambling during adulthood. The findings highlight the potential divergence in results that arise from basing conclusions on individual-level and longitudinal analyses as opposed to cross-sectional designs. Both studies show that risk-taking during adolescence does not always translate into problematic behaviour during adulthood. The findings also provide conceptual insights into the nature of problematic behaviour and its developmental course in younger populations.

Keywords: gambling, gender, adolescence, longitudinal design

Cultural influences in gambling cognition – is the concept of luck and winning universal or cultural-specific?

OHTSUKA, K. (Victoria University)

This paper critically reviews the current state of gambling research regarding the relationship between cultures and gambling behaviour. While anecdotal evidence abounds highlighting the vulnerability of gamblers from culturally and linguistically diverse (CALD) backgrounds to develop problem gambling, systematic research on the link between culture and gambling cognition is scarce. One of the questions yet to be answered is if the concept of luck and winning are culture-specific or universal. The aim of this research was to explore subjective views of electronic gaming machine players from CALD communities regarding luck and winning. A total of 60 Australian electronic gambling machine gamblers from Chinese, Greek, Vietnamese, and Anglo backgrounds were recruited for the interviews. Procedure: Qualitative in-depth interviews were conducted to explore the subjective views of gamblers regarding the notion of luck and winning. Interviewees described a variety of views regarding luck and winning. Although qualitative research methods focus on unveiling subjective views and individual experiences associated with gambling, luck is defined in terms of obtaining the favourable outcomes (i.e., winning money) for gamblers’ betting decisions, hubris associated with winning, gamblers’ fallacy (disregarding the independence of each spin, the analysis of recent spin outcomes would indicate the future prospects of winning). Higher levels of education do not necessarily protect gamblers from developing gamblers’ fallacy. Rather some interviewees with university degrees employed more elaborate explanatory schemas in describing misconceptions. Further research is necessary to explore if this link between educational attainment and at-risk cognition is culturally specific or universal. Research on culture and gambling behaviour is still in its infancy and needs systematic effort to investigate the topic from multidisciplinary view points. The author believes that the research findings should be analyzed to see if the explanatory framework or schema on luck and winning can be considered universal or culturally specific. Recommendations for future research include the use of qualitative research methods to focus on subjective meanings, the importance of cultural competence of research engagement with CALD community participants, and the implications for psychological intervention dealing with entrenched cultural beliefs in a culturally competent manner.

Keywords: gambling, culturally and linguistically diverse backgrounds, culture, gambling, luck

Gambling among international and domestic university students and its relationship to life stressors

MOORE, S. (Swinburne University of Technology)

No reliable profiles of the extent of gambling or associated risk factors are currently available for the tertiary student population. The aims of this research were to (a) chart the extent of social/problem gambling among
international and domestic university students across two universities in Victoria, Australia (b) assess whether there were particular vulnerabilities in specific cultural and linguistically diverse (CALD) groups within the international student population and (c) examine a range of stress-related variables potentially associated with problem gambling among students. The invitation to take part in an internet or paper-based survey was emailed to groups of students, posted on student websites and advertised on flyers. The survey assessed gambling-related variables, academic, relationship and financial stressors and problems adjusting to university and general social life. Data is to be collected from a large sample of international and domestic students. To date, information is available from approximately 123 domestic students (52 male, 70 female, mean age 24.5 years) and 188 international students (100 male, 88 female, mean age 24.1 years). The results show that (a) domestic students gambled more than international students but their problem gambling rates were only about half those of the international students, (b) students born in Asian countries or from the Indian sub-continent showed greater vulnerabilities to problem gambling than other groups (c) problem gambling was associated with academic, relationship and financial stress, as well as ‘acculturation’ problems with university studies and peers. Additionally, life stresses and problems coping with communication, safety, peer pressure and finances were higher among international students. International students can experience social isolation, loneliness, financial and academic stresses in their temporary country, exacerbated by cultural and language differences and both perceived and real racism. Such vulnerabilities can result in higher rates of risk-taking behaviours such as gambling to excess. Additionally, the relative freedom of the Australian gambling culture can pose control difficulties for those for whom gambling venues provide a safe environment where daily stresses can be temporarily forgotten.

Keywords: tertiary students, gambling, international students, cultural and linguistically diverse backgrounds, problem gambling

### Stress, adaptation, social support and gambling motivation: Predicting gambling problems among international and domestic university students

THOMAS, A. (Swinburne University of Technology)

Gambling research conducted with university students is rarely focussed on university-related factors. Further, almost nothing is known about whether underlying gambling motivation is similar or different for domestic students (DS) versus international students (IS). This research aimed to see whether a process model of problem gambling developed with adults generalized to DS and IS. DS and IS participated in an online survey about wellbeing and gambling. Recruitment was via direct email and both electronic and paper flyers. Information was collected on life stressors; socio-cultural adaptation; depression; social support; gambling motivations; severity of gambling problems and both informal and formal help seeking. Data was collected from 136 DS aged 18-58 years (61 males $M = 23.48$ years, $SD = 6.87$; 75 females $M = 25.17$ years, $SD = 9.16$) and 222 IS aged 18-45 years (124 males $M = 23.63$ years, $SD = 3.43$; 98 females $M = 23.42$ years, $SD = 4.75$). Results showed that there was reasonable support for the model for IS. Those low on socio-cultural adaptation, depressed and who relied on informal help-seeking tended to be more motivated to gamble as a way of escaping from problems and because it was accessible. Further, IS who gambled to escape, because it was accessible and for the social environment tended to experience more severe gambling problems than those who did not gamble for these reasons. There was only limited support for the model for DS. Those low on socio-cultural adaptation, depressed and who relied on informal help-seeking tended to be more motivated to gamble as a way of escaping from problems and because it was accessible. Further, IS who gambled to escape, because it was accessible and for the social environment tended to experience more severe gambling problems than those who did not gamble for these reasons. There was only limited support for the model for DS. Those low on socio-cultural adaptation had a greater tendency towards escapist gambling; however no other variables predicted gambling motivations. As expected, gambling to escape and because it was accessible predicted severity of gambling problems. Contrary to expectations, neither life stressors nor social support predicted gambling motivation in either group. The model of problem gambling was only partially supported in the DS sample. Gambling problems in young people may be transitory rather than chronic (Slutske et al.,
and may be more related to experimentation and impulsiveness than coping with life issues. Interestingly, there was more support for the model in IS, suggesting there is a greater tendency for gambling motivations in this group to be related to life concerns and depression.

**Giving peace psychology away in Australia: A symposium on theory, data, politics and practicality**

Chair(s): LOUIS, W. (University of Queensland)

Discussant(s): BOENHKE, K. (Jacobs University)

In this symposium, four psychologists involved in “giving psychology away” in Australia discuss research projects and field applications in terms of not only theory and data, but also politics and practicality – what has been done; how it happened; what the barriers were; and lessons learned for the future. The talks span three levels of analysis and sources of activity: the psychologists in the public interest team of the Australian Psychological Society; the Psychologists for Peace interest group; and a specific intervention program for conflict resolution and cultural diversity, the Enhancing Relationships in School Communities project. At each level, an outline of achievements is given, relevant theoretical frameworks and/or are described, and of some of the political and resource challenges are described, as well as how these were overcome, and perceptions of what challenges and lessons lie ahead for the future. The symposium will introduce the scope of Australian peace psychology to both visitors from overseas and Australians unfamiliar with peace psychology. A distinguished international peace psychology scholar and practitioner will serve as discussant. By sharing ideas and enthusiasm for translating peace psychology into concrete applications and applications into exciting research questions and findings, the symposium aims to stimulate discussion and build links among the world community of peace researchers, activists, and policy-makers. The three key learning objectives of the symposium are: 1) to communicate some of the diversity of Australian peace psychology and its applied and research projects; 2) to share information about the development and implementation of peace psychology projects and the political and bureaucratic factors which have facilitated or
impeded the projects; 3) to stimulate discussion concerning the projects on the horizon and challenges and needs in the next decade of peace psychology.

Working as a psychologist in the public interest in Australia

BURKE, S. (Australian Psychological Society), GRIDLEY, H. (Australian Psychological Society)

The aim of this paper is to provide an overview of recent and past initiatives of the public interest psychologists at the Australian Psychological Society (APS), including responses to the Victorian Bushfires, sustainability and climate change, peace and conflict resolution, and reconciliation. The primary focus is on describing and discussing how the projects were developed and implemented, and how political sensitivities and obstacles such as funding and time were overcome, and where the public interest psychologists will go next. This discussion will focus on the conceptual and political levels of analysis. The data will consist of case studies of particular projects and resources developed at the APS and/or in collaboration with the APS interest groups. In this paper, the variety of ways in which psychologists “give psychology away” in Australia is sketched. Strengths and challenges of the current system are discussed. On the plus side, in Australia significant resources and goodwill are channeled into concrete outcomes through the activities of dedicated staff who produce programs, research projects, and resources such as pamphlets and policy statements, some of which will be discussed in the paper. Major challenges occur, inevitably, around staffing and funding. Prospects for the future are discussed as well as dreams of positive change. Psychologists in the public interest at the APS do fantastic work on a variety of projects, and it is a great pleasure to share these with colleagues from around the world at ICAP. A lively discussion and sharing of ideas for even more energy and achievement in this sector is anticipated!

Keywords: climate change, Victorian bushfires, sustainability, conflict resolution

Peace psychology in Australia: From interest group to interested group researcher

LOUIS, W. (University of Queensland)

This paper has two aims. First, I will describe some of the activities and projects of Psychologists for Peace, an interest group of the Australian Psychological Society whose members share an aim of working to promote peace in the world and to prevent conflict through psychological research, education and advocacy. Second, I will describe some research in peace psychology in the Australian context, with a focus on how the applied peace work and projects have fed into research questions. While the first part of my discussion focuses on case studies of recent projects of Psychologists for Peace, the second part outlines a series of experimental and field studies in social psychology, aiming to understand and predict dependent variables such as engagement in peace activism; support for political violence; and support for Reconciliation with Indigenous Australians vs. anti-Aboriginal prejudice. Via case studies of Psychologists for Peace initiatives -- from pamphlets and posters to podcasts and prizes – I outline a series of applications of peace psychology research and discuss the perceived impact on practitioners as well as members of the public. The studies outlined in the second part of the talk focus on barriers to peace as well as enabling factors. The results demonstrated the critical role of group identities and social norms (group-based standards or rules for behaviour). By “giving psychology away” with concrete projects, new ideas for theory and innovation are generated. This talk aims to introduce a sampling of Australian peace psychology to overseas visitors and interested Australians, hoping to share ideas and enthusiasm for translating peace psychology into concrete applications and applications into exciting new research.

Quantitative outcomes of the second phase of the Enhancing Relationships in School Communities project: Explorations in
conflict resolution, cultural diversity and program implementation in primary schools

WERTHEIM, E. (University of Melbourne), CROCKER, J. (University of Melbourne), WHITE, A. (University of Melbourne), FREEMAN, E. (University of Melbourne), TRINDER, M. (University of Melbourne), MACNAUGHTON, G. (University of Melbourne), SRINIVASAN, P. (University of Melbourne)

This paper reports on final outcomes of the second cohort completing the Enhancing Relationships in School Communities (ERIS) project. The project aims to improve methods for assisting schools to develop productive conflict handling processes and to positively address issues of cultural diversity. The aim of this paper is to evaluate quantitatively the outcomes of the ERIS program in terms of school implementation of ERIS ideas and activities and teacher and student learning related to conflict resolution and respect for cultural diversity. Thirteen Victorian schools were matched and randomly assigned to either a full-intervention group or a comparison group. In the intervention, ten primary schools took part in the 18-month ERIS program, which provided a professional development program to 3-5 person core (professional learning) teams. Core teams attended seven full days of professional learning and received four school visits by ERIS staff. The full school staff also attended one of those workshops. Three comparison schools were provided with curriculum materials, but received no further support. Staff from all schools were asked to complete questionnaires at pre and post-program. Measures assessed cooperative conflict resolution and cultural diversity knowledge, skills and attitudes through rating scales and scenario-based measures; teacher perceptions of their students’ knowledge, skills and behaviours in these areas; and hours taught of related curriculum. Field notes were compiled during school support visits to assess the degree schools had put ERIS into policy and practice and core teams had provided ERIS professional development for staff in their schools. Pre-program and post-program comparisons are reported examining differences between intervention school core team members, other staff from intervention schools, and non-intervention comparison staff at post-program (ANOVAs/ANCOVAs or nonparametric tests as needed). Schools responded positively to the ERIS program, implementing a range of related initiatives. Conclusions focus on the degree to which teachers in ERIS interventions schools, compared to control school teachers, increased their knowledge and skills in conflict resolution and cultural diversity, and viewed their students as increasing knowledge and skills. Benefits for non-core team staff reflected successful dissemination of ideas throughout the schools.

Keywords: Enhancing Relationships in School Communities (ERIS) project, conflict handling, cultural diversity, professional development, school

The Enhancing Relationships in School Communities project: Challenges and achievements in working with primary schools to enhance their cooperative conflict resolution processes and promote respect for cultural diversity

FREEMAN, E. (University of Melbourne), TRINDER, M. (University of Melbourne), MACNAUGHTON, G. (University of Melbourne), SRINIVASAN, P. (University of Melbourne), DAVIS, K. (University of Melbourne), WERTHEIM, E. (University of Melbourne)

The aim of this paper is to describe lessons learned and qualitative outcomes of Phase 2 of the Enhancing Relationships in School Communities (ERIS) project. Phase 2 of the ERIS program was a collaboration between the Australian Psychological Society (APS; Psychologists for Peace Interest Group), Catholic Education Office Melbourne, two primary schools and two universities. The program assists primary schools to develop more productive conflict handling processes and to positively address issues of cultural diversity. This paper describes a range of challenges that the schools faced and teachers’ perceptions of the most significant changes that took place in their schools as a result of their participation in the ERIS project. Ten Victorian primary schools (state and Catholic, with varying levels of cultural and linguistic diversity represented in each school) took part
in an 18-month professional development program (ERIS), in which three-five person core (professional learning) teams participated in seven professional learning workshops and received four school support visits. The full school staff also attended a one-day workshop. Field notes were compiled during the support visits tracking challenges faced by schools in implementing ERIS ideas and strategies implemented in each school. At the end of the program, two-three core team members from each school were interviewed about their “significant change stories” to understand the most important shifts and accomplishments in each school. The significant change stories and field notes were analysed qualitatively to examine the most important challenges described by staff, and the changes that teachers viewed as most impactful. The variety of ways in which the ERIS program was implemented in the unique context of each school is described. Schools reported a range of implementation challenges and highlighted the importance of sustained professional development, accompanied by school support visits, to allow staff to engage fully with complex issues and concepts and to apply them successfully to the individual school context. Schools successfully implemented a variety of ERIS-related initiatives, including teaching students ERIS curriculum, and applying ERIS ideas in the classroom, on yard duty, and with parents and fellow staff.

Globalization and research paradigms: Need for reflection

Chair(s): BHAWUK, D. P. S. (University of Hawaii)
Discussant(s): YAMAGUCHI, S. (University of Tokyo)

Globalization has impacted human psychology and societal development all over the world in multiple ways, yet researchers are committed to one way of doing research and are embedded in the logical positivist paradigm. This is most apparent in the area of industrial and organizational psychology where researchers tend to operate from a basic assumption that culture does not have much impact on organizational constructs, and ignore the role of organizations in societal development. Despite much research in cross-cultural psychology and organizations, we still find industrial and organizational psychology dominated by constructs like job satisfaction, organizational commitment, organizational citizenship behavior, performance appraisal, organizational justice, work stress, burn out, and so forth that have emerged in the west as if there are no others constructs in developing societies that are meaningful. It is no surprise that pseudo-etic research methodology dominates and remains the mainstream of industrial organizational psychological research. This symposium is an invitation to pause and reflect if we should continue on this path as researchers or change course in the new world that is not converging with globalization (Bhawuk, 2008; Berry, 2008; Kim & Bhawuk, 2008). Three papers that constitute programs of research in India and Japan are presented to raise awareness about the need for reflection about how we should proceed in the future. Anand Prakash presents Indian perspectives on meaning of work, and how it enriches the existing western and cross-cultural literature. Shiho Imashiro presents observations from field studies from Japan to enlighten the research stream on person-organization fit emerging from the west. Sonia Nongmaithem & Nachiketa Tripathi present findings from Indian public sector organizations about organizational learning and what it means.
in India. These three studies clearly demonstrate the need for changing course and exploring others methods to enrich our understanding of industrial and organizational psychology internationally, and especially its role in societal development. Bhawuk will discuss the need to move away from pseudo-etic to emic driven research grounded in indigenous psychological research, and present a model for how organizational psychology can include culture to address the needs of societal development.

**Meaning of work: Perspectives from India**

PRAKASH, A. (University of Delhi)

Meaning of work (MOW) has emerged as one of the binding constructs from the field of industrial and organizational psychology. The emerging scenario across the globe, however, evinces that people do share diverse meanings of work as situated in their respective cultural meaning systems and practices. The construct of MOW, as used in industrial and organizational theories, is simultaneously related to representation of reality of work life as well as a source of motivation for performance. In the last few decades several international projects have been undertaken to map this construct in the different parts of the world. Most of them have subscribed to one conceptual model and have ventured at portraying quantitative variations within some standardized theoretical frame of reference. The next generation of MOW research needs to go beyond this and invest into a deeper and intense appreciation at discursive level to understand the cultural shades of MOW as embedded in specific cultural contexts. Keeping the above as a point of departure in this program of research in India, we examined the cultural constructions of MOW. Drawing from cultural experiences from India, we present Indian emic voices. Theoretical contributions and implications for future research are discussed.

Keywords: meaning of work, India, organizational psychology, performance

**The reality of the evaluation of person-organization fit in a selection interview in Japan**

IMASHIRO, S. (University of Tokyo)

Recently, the fit between person and organization (person-organization fit or P-O-fit) has been attracting attention among Industrial/Organizational psychologists because the level of fit was shown to predict the positive attitudes toward organizations such as satisfaction and commitment among the employees. Thus, the valid evaluation of fit in the selection process is important for organizations. Some researchers claim that the best way to valuate the fit is through selection interview. Although a few studies have been done to examine the P-O fit evaluation in selection interviews, they failed to separate the P-O fit from the interviewer-interviewee fit. This study aims to verify whether the evaluation of P-O fit is possible in selection interview by separating it from the evaluation of interviewer-interviewee fit. Also, it is examined whether interviewers’ perception of their organizational culture may cause the idiosyncratic difference in the P-O fit evaluation among interviewers. Using the data collected through the actual selection process of a service organization in Japan, multi-level analysis was conducted, with the interviewees’ general values and the discrepancy between their values and those of their interviewers at the first level and with the interviewers’ perception of organizational culture at the second level. The results showed that among different interviewers, the same values of applicants were evaluated, which suggests that the P-O fit was actually evaluated. At the same time, it was shown that the interviewees’ values were evaluated to different extent among the interviewers, according to their differential perception of the organizational culture, even though they belonged to the same organization.

Keywords: person-organization fit, satisfaction, commitment, organisational culture

Organizational learning and the role of contextual variables in Indian public sector organizations: A qualitative study NONGMAITHEM, S. (Indian
The present study investigated the existence of organizational learning and the role of contextual variables in Indian public sector organizations. Specifically, it tried to answer the following questions: (1) Do members of organizations share knowledge and information? (2) What are the mechanisms that facilitate such processes? (3) Do these processes impact on the performance of the organizations in terms of profitability of the organizations? (4) What are the roles of leaders, organizational culture and strategies in terms of facilitating these processes? (5) Through these processes, are the organizations able to learn and then create knowledge base, which would help the organization in innovation, in the future? An interview schedule comprising of 12 different items, based on the above questions, was used to conduct in-depth interviews of 30 top-level managers from 13 Indian public sector organizations across 3 metropolitan cities. Content analysis revealed several themes. In most of the organizations, there were sharing of information and expertise amongst the organizational members, both at individual and organizational level. Sharing at organizational level indicates existence of organizational learning. The responses of the interviewees, further, showed patterns of formal and informal mechanisms, which facilitated the process of sharing amongst the organizational members. It was also found that documentation and retrieval of information is given due emphasis in many of the organizations as this helps in maintaining the repertoire of knowledge, which can be used by the present members as well as future members. Moreover, the results of this study showed that leadership, comprising both transformational and transactional style, emerged as an important factor, which influenced the learning and sharing of information and expertise. Organizational culture present in these organizations comprised characteristics such as transparency, accountability, trust, openness, accessibility of the leaders, etc., which are similar to the components of learning culture. Also, the positive role of proactive strategy emerged from the analysis. Top executives interviewed in the present study acknowledged the role of organizational learning towards better performance and profitability. Finally, there were indications about the unexplored link between organizational structure and organizational learning.

A theoretical framework for social change: Role of ecology, history, culture, zeitgeist, institutions, & leaders

BHAWUK, D. P. S (University of Hawaii at Manoa)

As ecology and history shape culture, any discussion of societal development needs to be couched in the historical context since the present emerges from the interaction between the past and the zeitgeist (Bhawuk, 2003, 2010; Liu, in press; Liu & Hilton, 2005; Triandis, 1994). It is important to do so as this would allow us to be objective about the role of colonialism and the zeitgeist of dominant logical positivism in shaping the way we view ourselves, our profession, and the knowledge we create. It would be ostrich like to try to bury the pathological consequences of colonialism and its impact on who we are, what we study and how (Bhawuk, 2007, 2008a; Smith, 1999). However, delving too much in the history of colonialism and its impact on knowledge creation can also take away the freedom to break the fetters of intellectual colonization and soar in the indigenous space of insight and wisdom. Hwang (2004) cogently argued that for indigenous psychologies to guide economic development in developing societies researchers will need to reflect philosophically and not follow the western philosophical positions on the meaning of modernization. Often it is assumed that the Big-Bang of knowledge creation started with renaissance in the West in the fourteenth century. It is important to remember that China and India were the first world economically until 1760 and produced 75% of the world GDP (Bhawuk, Munusamy, Bechtold, & Sakuda, 2007; Kennedy, 1988). What is considered first world today was third world up to 1760. The cultural wealth in these countries has not been lost, and people in these
countries only need to reorient themselves to their cultural paradigms, which is already happening. In this paper, an attempt is made to present a model of societal development that synthesizes indigenous insights, by including history, ecology, zeitgeist, organizations, and leaders who drive changes in societies. It is argued that such a model allows capturing indigenous worldviews, and can be tested “empirically,” where empirically does not necessarily mean following the logical positivist worldview and methodology.

**Health behaviour interventions in low and middle income countries**

Chair(s): PELTZER, K. (HSRC)

There is an urgent need of health psychology and behavioural medicine to fight disease and to promote health in low and middle income countries. This symposium will give an overview and selected examples on targeted health behaviours including diet-related risk factors and physical inactivity, sexual and reproductive health, addictive substances, injury and violence, preventive health exams, mental health, adherence to treatment in medical conditions, vector control, and hygiene behaviour.

Overview on health behaviour interventions in low and middle income countries

PELTZER, K. (HSRC)

This paper will give an overview on targeted health behaviours in low and middle income countries including diet-related risk factors and physical inactivity, sexual and reproductive health, addictive substances, injury and violence, preventive health exams, mental health, adherence to treatment in medical conditions, vector control, and hygiene behaviour.

Theory-based health behaviour intervention

PENGPID, S. (University of Limpopo)

Effective health promotion and health education, including public health, depends on the utilization of appropriate theory and practice strategies for a given problem and situation. Many interventions are meant to
bring about change in characteristic features of the person. An alternative approach is to focus interventions more on communication, decision-making skills, beliefs and knowledge. Interventions require advocacy and dissemination, particularly at context level i.e. policy makers, community leaders, and other government agencies. The presentation will covered the rational of health intervention programmes and the strategy for the development and implementation of intervention programmes. The aim of this paper is to oriented audiences about health behaviours, health behaviours intervention and theories related to health behaviour change. The paper serves as introductory part of the symposium, in order to provide background knowledge and emphasis on the health behaviours interventions. Based on a literature review, the speaker will provide information on understanding concepts of health behaviour and intervention strategies, theory and models, utilization of theories to develop effective health behaviour interventions. The presentation will cover following topics: 1) the utilization of theory to generate ideas in health behaviour intervention research and evaluation, 2) how to develop an effective intervention-oriented research, 3) models and theories in health behaviour research, 4) methods of theory testing and theory comparison in research, 5) strategy for the development and implementation of intervention programmes, 6) practical case study and models of effective of intervention research. The audience will be equipped with background information and principles of health behaviour interventions.

Health contexts for orphan girl children: The influence of school

MPOFU, E. (University of Sydney)

School is a context for child health from the life-skills students learn from schooling. Types of schools may influence the specific health-related messages that students are exposed to or perceive to receive. Church or faith-based schools may value faith informed concepts for health whereas secular schools may emphasize life-skills education. The study investigated how female orphans perceive HIV messages from church-affiliated compared to secular secondary schools, and to explore the context in which they make sexual decisions. One hundred and eight Zimbabwean teenage orphans (mean age 13.7 months, SD = 5 months) attending five church-related schools (n = 56) and five secular schools (n = 44) participated in the study. The students generated statements in response to a focus group discussion probe on the messages they perceived to receive from church-related versus secular schools which they believed to influence their sexual decisions. Data were analysed using concept systems, a mixed method approach that allows for statement aggregation into thematic units representing core meanings from brain-stormed focus group statements. Students from church-related schools perceived to receive from their school faith-based reasons for abstaining from sex or delaying sexual debut. Students from church related schools also mentioned the importance of personal goals (such as school achievement) as a primary message for health from their schools. Students from secular schools tended to report an emphasis by their schools on life skills education and the importance of reducing the burden of care to parents or guardians by not acquiring an unwanted pregnancy or contracting HIV. Fear of the social consequences of early and unwanted pregnancy was perceived by the teenage orphan girls in both church-related and secular schools to be a significant deterrent to sexual debut. Teenage orphan girl children perceive the school context to influence their decisions about sex. Developmentally appropriate concerns about the need to invest in education and to avoid early, unwanted pregnancy an important prism though which teenage orphan girls appropriate sexual health education messages.

Keywords: secular schools, female orphans, HIV, church-affiliated schools, students

Lay counsellor-based risk reduction intervention with HIV positive diagnosed patients at public HIV counselling and testing sites in Mpumalanga, South Africa
PELTZER, K. (HSRC)

To evaluate the feasibility, fidelity, and effectiveness of a human immunodeficiency virus (HIV) prevention intervention delivered to HIV-infected patients by lay counsellors during routine HIV Counselling and Testing (HCT) public service in Mpumalanga, South Africa. A total of 488 HIV-infected patients, aged 18 years and older, receiving HCT service at clinics in Mpumalanga, received an “Options for Health” intervention delivered by clinic lay counsellors. Intervention lay counsellors implemented a brief risk reduction intervention at on average 2.3 sessions to help patients reduce their unprotected sexual behaviour. Questionnaires were administered at baseline and 4 months following the intervention to assess HIV risk behaviour in previous 3 months. A significant increase in AIDS knowledge, behavioural intentions and risk reduction efficacy among participants at follow-up has been shown. Participants at 4-months follow-up reported a significant reduction of multiple partners, unprotected sex, alcohol or drug use in a sexual context, and transactional sex. In addition, sexual abstinence increased and alcohol use decreased, in the past 3 months. A lay counsellor-delivered HIV prevention intervention targeting HIV-infected patients seems to be feasible to implement with fidelity in the South African HCT setting and effective at reducing risk behaviour.

History of applied psychology: national trends and developments

Chair(s): CARPINTERO, H. (Open University of Madrid (UDIMA))
Discussant(s): PRIETO, J. M. (Complutense University Of Madrid)

Applied psychology offers a great variety of approaches and problems, which are largely due to the demands from societies that promote its development. The symposium offers several views regarding the development of psychological intervention in Spanish and Latin American societies in the 20th century. The relevance of psychology has been based on the utility of psychological techniques for solving social conflicts. The contributions are focused on the study of special areas, problems and instruments.

Development of fiscal consciousness among Spanish women (1975-2009)

QUIÑONES-VIDAL, E. (University of Murcia), ALARCON-GARCIA, G. (University of Murcia), PEÑARANDA, M. (University of Murcia)

Since the advent of democracy, significant changes have taken place on tax compliance among women in contemporary Spain. Under the new regime, the tax system was adapted to the interests of a social oriented democracy, promoting equality of opportunities, and equality between genders. An empirical analysis of fiscal data, based on information from the Institute for Tax Policy Studies in the 1975-2009 period, has been carried out. Attitudes toward the Treasury, and ethical components of fiscal consciousness were considered. Significant changes have been detected, and have also been tentatively differentiated. Moral sense and beliefs and the various types of attitudes toward tax control are described. Their correlation with other relevant social variables, such as social status,
age, and level of education have been taken into account. In conclusion, significant changes seem to have appeared, connecting fiscal consciousness to both level of age and cultural level. The democratic framework of contemporary society seems to be on the ground for these type of social phenomena, that are largely dependent of public information and historical variables.

Keywords: tax compliance, Spain, democracy, fiscal consciousness

Work and organizational psychology in contemporary Spain

PRIETO-ZAMORA, J. M. (Complutense University Of Madrid)

Summarizing the main findings in the history of Work Psychology in Spain is the main focus of this paper. A 500-page book was published in 2009. It required the collaboration of scholars and practitioners (many of them already retired) to reconstruct, in a systematic manner, what was built for a century in this country. Analysis of archives, interviews with colleagues in each of the main regions in the country, a follow up of data in psychological journals and magazines in the human resources field, analysis of CVs of pioneers in universities and institutes of Psychology, have been the basis for generating an overview that ends in 1975, the end of Franco’s regime and starts when the second International Congress of Psychotechnology (now ICAP), was held in Barcelona in 1921. Among its main results, the following ones are considered. One section analyzed the leading figures’ contributions in either books or articles. Another section summarized the main findings by regions where practice was carried out both by public and private organizations. The third section explored new challenges and advanced developments in the field. The work and organizational field is the first area of expertise within Spanish Psychology that has generated a thorough study, both quantitative and qualitative, of what was done by pioneers in the field. 6,000 copies have been distributed to members of the Spanish Psychological Association and the Spanish Association of Personnel Directors. As a result, I/O students and graduates know who was who in the field up to 1975. The picture strongly reinforces the professional identity of the practitioners as well as the academicians working in that field.

Keywords: work psychology, Spain, organizational psychology, Spanish Psychological Association

Historical studies on applied psychology through the Revista de Historia de la Psicologia (Journal of History of Psychology, Spain) 1980-2009

MESTRE, V. (University of Valencia), TUR, A. (University of Valencia), SAMPER, P. (University of Valencia)

The Journal of History of Psychology (Revista de Historia de la Psicologia), founded in 1980 at the University of Valencia (Spain), is now the oldest living journal in the field of psychology history within Spain, and one of the few publications in this field all over the world. It publishes articles both in Spanish and English, and is currently one of the main sources of historical information in psychology. The contents of the journal have been analyzed, in order to determine the topics and authors that have contributed to the knowledge of the history of applied psychology. A bibliographical and bibliometric methodology has been applied in this research, in order to determine the amount of articles published in its whole collection, related to applied psychology topics and working groups. An effort has been made to categorize the papers that were found, and a detailed study was also carried out on the main working groups, leading authors and dominant topics and questions present in its pages. Although the journal puts a special emphasis on Spanish psychology, there are several significant papers dealing with applied topics, as the result of the application of a bibliometric methodology to analyze some specialized journals that discuss applied topics - Sport psychology, traffic safety, and so on. The journal appears as an effective and significant source of historical information for the mentioned areas. The variety and soundness of most of the contributions reveal the intellectual value of the publication for all those interested in historical research in psychology.
History of applied psychology in Argentina: Changes and variations related to the social and political development in the country

ROSSI, L. A. (University of Buenos Aires)

History of applied psychology in Argentina has to be viewed in the light of the country's history. The political changes and disruptions and the social changes experienced by the Argentinian society have deeply influenced the evolution of its applied psychology, which is strongly connected with the needs and aspirations of that society. The country history has been organized according to certain periods, through which the main advances and achievements in the field are interpreted in this paper. We begin with the consideration of the Conservative political period of the Argentinian contemporary history (1900-1916), in which clinical and criminal psychology significantly developed, a process largely due to the needs and purpose of getting strong social control and regulation of the great European immigration. In the 20's, social labor appliances by means of various Institutes paralleled the social and economic inclusion of immigrants, according to an active political participation. A new conservative period (1930-1946) with restricted participation and significant inner migration from the rural world to the industrial areas at the urban centers, shows not only the abrupt disappearance of Labor Institutes but also the rise of criminal psychiatry and the growth of clinical psychology. During the open air period lived by the country between 1948 and 1955 an open political period paved the way to the large development of an educational and psychotechnic psychology tradition. All applied psychology traditions flourished and allowed the foundation of university professional careers of Psychology in the whole country, that took place the following years. A close analysis of the historical changes and the intellectual developments in the field of psychological intervention shows the validity of the hypothesis that maintains the existence of a close relationship that links the psychological world to social movements in modern countries. Argentinian history is a clear example of the close interrelationship between the psychological world and the social and political development in a society. The various periods of that history throw significant light on the evolution of this special psychological field.

Keywords: applied psychology, Argentina, social development, political development

A landmark work in Latin American applied psychology: Bela Szakely's “Los Tests”

CARPINTERO, H. (Open University of Madrid (UDIMA)), DEL BARRIO, V. (Open University of Spain (UNED)), GONZALEZ, M. J. (Open University of Spain (UNED))

Bela Szekely (1892-1955,) a Hungarian-born psychologist, who emigrated to Latin America in the days of the Second World War, and had a large influence since he settled down in Buenos Aires in the late 30’s, published an important collection of tests for the use of teachers and professionals, which have been useful as a reference book for psychologists and students for many years, and have contributed to the popularization of psychology in the Spanish speaking world. Three consecutive editions of the book (1946, 1948, and 1966) have been published. New instruments and tests have been included in each version, and its history reveals the story of the growing needs and the changing demands of technical information and means experienced by the professionals of psychology in these countries. Bibliographical and bibliometric approaches provide us with a detailed picture of the changes and improvements that have been taken place in the book along the years. The three editions are compared, and the changes found are analyzed in order to determine the theoretical movements and the professional demands that could explain them. Significant variations have taken place in the successive editions of the book. While the first one largely relied on intelligence evaluation and assessment, the second one added an important section on personality assessment, that needed a two-volume edition, which means to increase nearly 30% of pages to the previous one. The
third edition appeared in a posthumous manner, under the care of A. Calcagno, and opened its pages to the collaboration of significant names in the Spanish speaking psychology, who found in this book a well-known instrument to spread their knowledge in a time when the psychologist career in most of those countries was beginning. The book appears as a useful and largely employed instrument in Latin American applied psychology. Changes in its content may be taken as indicators for detecting some changes and trends in that field.

Keywords: Latin American, Bela Szekely, Buenos Aires, personality assessment, applied psychology

Identity construction in the working lives of older women:
International perspectives

Chair(s): WATSON, M. (Nelson Mandela Metropolitan University)

Discussant(s): BIMROSE, J. (Institute for Employment Research, University of Warwick)

The working lives of older women are constructed over time through a complex interaction of many systemic factors such as their context, culture, life-stage, perceived support and personality. These factors can negatively influence the identity construction of older women resulting in social and economic consequences such as higher levels of welfare dependency, low self-esteem and disengagement from the community. The working lives of older women are complex and their career development is embedded in discriminatory practices across labour markets around the world which militate against the optimal use of their skills and talents. Further compounding the career development of older women is that ageism and sexism are two universally persistent features of labour market disadvantage. Thus the situation of older women in the labour market differs considerably from that of their male counterparts in that their working lives are more likely to be affected by parenting responsibilities, broken employment patterns, part-time employment and inequality in the workforce. Such social equity issues are not country specific, with gender inequality featuring in labour markets of developed and developing countries. The consequence is that women continue to be marginalized, despite the general recognition that economic prosperity within nations requires the full and equal integration of women into all levels and occupational sectors of labour forces. The present symposium explores the working lives of older women across four nations as research to date has largely focused on women of child bearing age. Thus less is known about the working lives of older women. The key learning objectives of this symposium are to: a) develop
an understanding of older women’s career development in diverse countries; b) identify global and local narratives of older women, c) develop an understanding of research methodologies appropriate to investigating older women’s careers, d) consider issues and challenges facing research into older women’s career development.

**Combating occupational segregation: the role for careers guidance and counselling**

**BIMROSE, J. (Institute for Employment Research, University of Warwick)**

To examine how older women workers in England (45 to 65), have moved through different employment and learning contexts. A qualitative, case study approach was used for this small scale country study, since it encourages multiple methods of investigation and recognises the importance of both context and social structure. In so doing, it combines elements of the psychological and social scientific approaches essential for investigating the career development of older women. Purposive sampling enabled the identification of participants from on-line questionnaires completed by a large (c 1,100) European sample of mid-career workers (2009) who had indicated their willingness to be interviewed. Data collected during in-depth telephone interviews supplemented the questionnaire data to provide rich and deep insights on the learning and career trajectories of older women. The strategic biographies of a small sample of women were constructed as they responded to the challenges of balancing the demands of formal employment whilst continuing to develop their work-related learning, careers and identities. Discrimination emerged as crucial in both shaping career progression and also influencing personal and professional identities. A complex interaction of a number of variables in the development of older women’s learning and career trajectories became evident as data analysis progressed. The focus of this paper relates to data collected on workplace discrimination, which emerged as an important factor. This was barely recognised by some participants and its formative influence marginalised by others. Yet its impact in structuring opportunities and aspirations is evident. Particularly striking is the way in which experiences of discrimination in the workplace tend to be systematically normalised by victims and how a range of strategies for coping are deployed. Embedded in these responses was the taken-for-granted assumption that this is how things are and simply have to be tolerated. Gender discrimination continues to act as a barrier to women’s learning and career progression. Access to formal career guidance and counselling support is rare. Where informal networks were under-developed, individuals struggled to progress. This poses a set of challenges for the professional practice of careers guidance and counselling.

**Keywords**: women’s underrepresentation, England, employment, occupational segregation, vocational guidance

**Socially embedded career identities: A voice-centred analysis of the career narratives of ten Black South African women**

**FRIZELLE, K. (University of KwaZulu-Natal)**

Career theories, particularly in the post-modern context, have increasingly been challenged for their implicit (Western) assumption that autonomous individuals make internally driven career decisions. A recent article by Duffy and Dik (2009) highlight a number of sources ‘beyond the self’ that influence career development. While promising, this research continues in the realist tradition by reducing ‘external sources’ to variables that influence a pre-existing individual. This paper aims to challenge this view that reinforces the individual-social/agency-determinism dichotomy in relation to career development. The paper argues that there is a dialectical relationship between the individual and society. Rather than simply influencing the career choices of an individual social factors help create the socially embedded individual who is constantly negotiating her subjectivity and career identity within particular (and sometimes multiple) socio-political and cultural contexts. Career research needs to start asking research questions that are framed by an understanding of individuals as socially-embedded. This study
is informed by the theory of hermeneutics, which acknowledges the historical and social contexts that shape individuals’ interpretations of their lives. Narrative interviews were used to collect the career development stories of ten Black South African women and the voice-centred method of analysis, based on the principal of relational ontology, was used to analyse the narratives. The analysis powerfully demonstrates the social embeddedness of the women’s career narratives. The study illustrates that the women’s process of career development cannot be separated from the process through which they negotiated complex webs of interpersonal relationships and cultural scripts within a particular socio-political context. The analysis, for example, illustrates how the women’s career narratives are informed by wider apartheid legislation and, therefore, identity constructs such as race and gender. Cultural scripts around connectedness and personhood were also found to be integral to the career development of these women. Social factors cannot be seen as “beyond the self”, but should rather be seen as inextricable from the ongoing process of identity formation and, therefore, career development.

Older Australian women’s careers: Learning from significant transitions

MCMAHON, M. (The University of Queensland)

Older women’s career trajectories are more likely than those of men to include late entry to the workforce, interrupted workforce participation or substantial part-time employment. Older women therefore are likely to have experienced many learning and work transitions. The aim of the study was to examine how Australian women cope with learning and work transitions and adapt to the new situations brought about by such transitions. Data was collected by semi-structured interviews. Participants were recruited by career counsellors who made project information supplied by the researcher available to women in the 45 to 65 year age group. Women interested in participating in the project contacted the researcher. The focus of the present paper is on the most significant work or learning transition experienced by participants. The interview included questions related to the process of the significant transition, emotions experienced during the transition period, issues faced (e.g., finance, family commitments), support accessed, strategies employed, and advice to others. Data analysis was conducted using a grounded theory approach. All of the participants had experienced numerous learning and work transitions during the course of their careers and all were able to identify their most significant transition. Findings confirmed the relational nature of the women’s careers and provided insight into strategies employed by the participants in adapting to transition. A lack of professional support accessed by the women was evident as was their resourcefulness in adapting to transition. The need to consider both the subjective and objective experience of career transition is evident in the findings. Further, the findings suggest that providing opportunities for women to tell holistic career stories may be a useful strategy for career development practitioners. The challenge of encouraging women to access professional support is considered.

Keywords: older people, work transitions, support, coping strategies, career development

Work and older women: Perspectives from India

VINDHYA, U. (Centre for Economic and Social Studies), WATSON, M. (Nelson Mandela Metropolitan University)

An overwhelming predominance of informal (largely home-based) over formal workforce participation, the constraints of women’s reproductive roles and responsibilities, and cultural sanctions on work outside the home characterize the women’s work scenario in India. The aim of this paper is to provide an overview of the literature on the working lives of older women in India. The paper is based on a decadal (1999-2009) review of literature published from India in English on issues of older women workers. The dominant disciplinary prisms through which the nature of
women’s paid work force participation is analyzed are largely through labour economics and sociology. Demographers have noted that feminization of the aging population is an important emerging trend in India but the literature on working lives of older women in particular is scanty. The greater representation of women in the informal sector means that older women who have never worked in the formal sector are not likely to start working later in life; and that women in home-based occupations continue to work throughout the life course. However, work related issues including the impact of work on women’s autonomy and identity, and the nature and consequences of work life balance for older women have not received much attention. The field of psychology has largely concentrated on the challenges and health consequences of aging; the psychosocial situation of older women and comparisons with men in similar age cohorts; and implications of elder care policies. Literature indicates the interplay of multiple social hierarchies — of gender and generation — with older women seen as wielding considerable power in the household and on younger women’s work-life choices. The popular belief about declining family support due to urbanization is not supported, implying that care giving responsibilities of women continue beyond the reproductive age. Studies on psychological well being of older women show that continuation of care work functions provide some kind of a buffer against mental health problems like depression. The implications of the literature review are discussed in the context of national frameworks and policies related to older women workers.

Keywords: gender roles, feminization, urbanization, psychological well-being, India

Career and learning transitions of older Xhosa-speaking women in academia

WATSON, M. (Nelson Mandela Metropolitan University)

There are historical, social and gender barriers to the career development of South African women which have resulted in discrimination, prejudice and inequalities in the work place. Thus, while women represent over half of South Africa’s adult population, they only represent 15% of all executive management positions. Despite employment equity legislation, Naidoo and May (2006) are of the opinion that a decade later there has been little improvement in the working conditions and career prospects for South African women. The present study explores how Xhosa-speaking women between the ages of 45 and 65 years cope with work and learning transitions within a tertiary academic institution. The research was conducted within a qualitative, multiple case study approach. The sample consisted of 6 Xhosa-speaking women employed in academic and non-academic (administrative) positions at a South African tertiary institution. The women participated in a semi-structured, taped interview of approximately one hour duration. The interview structure was co-developed internationally and provided women with the opportunity to explore work and learning transitions both in terms of their past, present and future, as well as the systemic influences on such transitions. The taped interviews were transcribed, validated by the participants, and the content themed. Several themes were generic across the participants and the various positions in which they were employed. These themes demonstrated the influence of cultural beliefs about women working and the significant influence of both nuclear and extended family members. Regardless of the level of employment and learning attained, all participants had experienced considerable barriers in terms of interpersonal and financial support, as well as the negative impact of disadvantaged historical, social, political and educational influences on their development. The marginalised status that emerged from the narratives of all the older women in relation to work and learning transitions they have made challenges more conventional and westernised conceptions of women’s career development. As such, these narratives endorse the need for career counsellors to consider more qualitative approaches in their career practice.

Illustrating the need for substantive methodological synergies in educational and psychological research

Chair(s): MORIN, A. J. S. (University of Sherbrooke), MARSH, H. W. (Oxford University)

Marsh and Hau (2007) and Borsboom (2006) emphasized the need for substantive-methodological synergies (SMS) in psychological research. SMS represent joint ventures in which new methodological developments are applied to substantively important issues. Marsh and Hau (2007) argue that SMS offer a unique, creative, and more precise way of analyzing psychological phenomenon. Borsboom (2006) underlined the widening gap between methodological refinements and applied research and proposed SMS as a way for psychometricians/statisticians to play a more direct role in psychological investigations. Given the widening gap between methodological refinements and the quantitative repertoire of applied researchers, both papers have yet to exert a determining influence on applied research. Indeed, applied researchers often lack the (a) mathematical training required to access these development and/or (b) the time to sort through methodological journals given the pressure they are under to publish in their substantive area. Clearly, substantive methodological synergies represent a way to (a) shed new light on substantively important questions; (b) bring methodological development in an “arena” were applied researchers will read them; (c) provide methodological experts with an opportunity for simpler presentations of methodological refinements. In the present symposium, the papers will demonstrate the importance and usefulness of harnessing the synergy between advanced methodology and meaningful substantive issues. Following a brief introduction, the first paper will present a detailed review of methods developed to test for latent interactions and illustrate their importance for substantive research. In the second paper, the authors will present a further illustration of latent interactions methods but extend these methods to multilevel structural equation models (SEM) designed to study what motivates students from 57 countries worldwide to pursue science-related careers. Then, a third paper will illustrate the usefulness of three-level multilevel models in addressing substantively important ecological and transactional questions in educational research. The last paper will present results from a longitudinal study designed to evaluate the developmental stability/instability of anxiety development in adolescence relying on growth mixture models, while at the same time illustrating the biasing impact of model specification on the obtained results. Discussion will follow.

Estimating and testing latent interactions: Advancements in theories and practical applications

HAU, K. T. (The Chinese University of Hong Kong), MARSH, W. (Oxford University), WEN, Z. (South China Normal University)

Estimating the interaction between variables is an important theoretical, substantive, and empirical issue in psychology and many other social sciences. Despite this ongoing emphasis on interaction effects, empirical support for predicted interactions has been disappointingly limited. One reason might be that the independent variables are contaminated by measurement error and do not provide accurate estimates of true interaction effects. Particularly when there are multiple indicators of these variables, latent variable approaches provide a much stronger basis for evaluating the underlying factor structure relating multiple indicators to their factors, controlling for measurement error, increasing power, and, ultimately, providing more defensible interpretations of the interaction effects. Nevertheless, despite the widespread use of structural equation models (SEM) for the purposes of estimating relations among latent variables and the importance of interaction effects, there have been very few substantive applications of SEMs to estimating interactions...
between two latent variables. This is due mainly to the complexity in the implementation of the estimation procedures in commercially available softwares. In this paper, we will review and compare various maximum likelihood (ML) approaches for estimating latent interaction effects in SEM (Marsh, Wen, & Hau, 2004, 2006) and illustrate their use in substantive research. These approaches include the unconstrained (Marsh et al., 2004), constrained (Algina & Moulder, 2001), and generalized appended product indicator (GAPI; Wall & Amemiya, 2001) approaches. Recent developments including the double-mean-centering strategy and the elimination of the mean structure totally by centering the latent interaction construct will also be discussed (Marsh, Wen, Hau, Little, Bovaird, & Widaman, 2007). Similar to the multiple regression models in which the typical standardization of interaction terms is not appropriate, analogous problem exists for SEMs. We will also demonstrate how appropriate standardized parameter estimates are easily formulated from parameter estimates routinely available from existing SEM software packages (Wen, Marsh, & Hau, 2010).

“Who took the “X” out of expectancy-value theory?” - A cross-cultural analysis with PISA 2006

MARSH, W. (Oxford University), NAGENGAST, B. (Oxford University), SCALAS, L. F. (Università di Cagliari), XU, M. (Oxford University), HAU, K. T. (The Chinese University of Hong Kong)

Students’ enrollments in sciences are declining worldwide. Previous research shows that self-concept, interest and achievement are reciprocally related and important predictors of coursework selection and career choice. Here we apply/extend Expectancy Value Theory (EVT). EVT posits that academic choice is a function of $E = \text{Expectations of Success}$ (ASC=academic self-concept), $V = \text{Value}$ (ENJ = enjoyment), and their interaction ($ExV = ASC \times ENJ$). The $ExV$ interaction implies that students are most motivated when both $E$ and $V$ are high. However, this critical interaction has been largely dropped as non-significant from applied EVT research. We argue that the failure of modern EVT research to find $ExV$ interactions is largely due to methodological limitations. We posit that new multilevel structural equation models (M-SEM) with latent interactions will resolve the problem of the missing $ExV$ interactions in EVT. This study will rely on the OECD-PISA-2006 database, allowing international comparisons of educational outcomes across 57 countries ($n = 400,000$ students). Measures from this database covering science-related independent (ASC-expectancy; ENJ-value; ASCxENJ; achievement-ACH) and dependent (career plans; activities) variables will be used. In the present study, M-SEM with latent interactions will be used to evaluate the presence of the $ExV$ interaction in EVT. The results show, in the total sample, significant positive effects of ASC, ENJ and ASCxENJ on both science-related career plans and activities. Multiple-group models (57 countries) further show that ASCxENJ is statistically significant in the prediction of science-related career plans in 45/57 countries and in the prediction of science-related activities in 48/57 countries. In addition, the results show that ASCxENJ is substantially related to country level values of individualism. Consistent with early EVT but contrary to subsequent versions, the $ExV$ interaction is statistically significant, highly reliable, and supports the need to reinstate the $ExT$ interaction into EVT. The study addresses the critical issue of declining science enrolments, has profound implications for motivation theory, is based on cutting-edge, emerging methodology, uses the best available data, and fits well with our program of substantive-methodological synergy development. Each of these aspects will be more completely discussed in the context of the conference.

Integrating multilevel modeling and conceptual frameworks to shape further understanding of constructs in educational psychology
Abstracts of the 27th International Congress of Applied Psychology

MARTIN, A. J. (University of Sydney), BOBIS, J. (University of Sydney), ANDERSON, J. (University of Sydney), WAY, J. (University of Sydney), VELLAR, R. (Catholic Education Office)

Multilevel modeling provides a more appropriate mean of evaluating important educational issues than would be possible with typical single-level analyses that ignore the clustering of individuals within groups (Goldstein, 2003; Raudenbush & Bryk, 2002). It is evident, however, that there is substantial variation in the extent to which group differences exist on salient educational psychology constructs. Using multilevel modeling, the paper presents a conceptual framework developed by Martin (2009) drawing on the Ecological Systems Framework (Bronfenbrenner, 1979) and the Transactional Model (Sameroff, 2009) to progress current understanding of a diverse selection of educational psychology constructs that evince different amounts of variance at different structural levels. The sample comprises 4,383 Australian students (54% female, 46% male) from 250 classrooms in 47 schools across Grades 5 (22%), 6 (22%), 7 (28%), and 8 (28%). Students were administered scales encompassing mathematics motivation, engagement, and homework completion – as well as a brief mathematics test. Multilevel modeling was conducted using MLwiN with particular focus on variance explained at student, class, and schools levels on each of these factors, beginning with a variance components model through to a final conditional model with covariates. Consistent with hypotheses, results demonstrated different amounts of explained variance for different educational psychology constructs at different levels (student, class, school). For example, the bulk of variance (>90%) on ‘intra-psychic’ constructs (e.g. motivation) was explained at the student level. On the other hand, constructs (e.g. homework completion, achievement) that are more embedded in or activated by environmental factors (e.g. teacher, school policy) evinced significant variance at student, class, and school levels. These effects were evident in variance components models and models controlling for variance attributable to gender, age, and ethnicity. Consistent with Martin (2009), the study demonstrates that through the integration of substantive (ecological systems theory, transactional model) and methodological (multilevel modeling) considerations, a range of educational psychology constructs can be meaningfully profiled in terms of their relevance at student, class, and school levels. This substantive-methodological synergy holds vital implications for psycho-educational intervention through identifying appropriate levels for particular educational psychology constructs at which to direct practice and resources.

Growth Mixture Modeling of adolescents trajectories of anxiety across adolescence: The impact of untested invariance assumptions on substantive interpretations

MORIN, A. J. S. (University of Sherbrooke), MAÎANO, C. (University of the Mediterranean Aix-Marseille II), MORIZOT, J. (University of Montreal), JANOSZ, M. (University of Montreal)

Since Nagin (1999) paper on latent class growth analyses (LCGA), the number of publications attempting to model developmental heterogeneity literally exploded. However, LCGA assume the absence of inter-individual variability within the extracted trajectories. Alternative methods, namely growth mixture models (GMM), were developed by Muthén & Shedden (1999) to address similar questions without this assumption and allowing most models parameters to vary across classes. Proponents of LCGA usually argue that their models are more parsimonious whereas proponents of GMM argued that their models are more realistic. Unfortunately, few empirically tested these assumptions and those who did generally found that assuming between-trajectory invariance of models parameters may result in biased estimates (Enders & Tofighi, 2008). In this study, we investigate the impact of model specifications on substantive conclusions. Substantively, this study addresses the issue of the developmental stability or instability of anxiety across adolescence. Indeed, the stable or transient
state of anxious symptoms across the high school year is an issue that has yet to be clarified, which might potentially be related to the presence of unobserved developmental heterogeneity. Data from the Montreal Adolescent Depression Development Project (MADDP), a four-year follow-up of over 1,000 adolescents who completed the Beck Anxiety Inventory each year will be used. The relative fit to the data of nested LCGA, class-invariant GMM and GMM with class-varying parameter will be empirically compared. However, the model with the optimal number of classes within each parameterization will also be interpreted. The final retained model will also be associated with predictors (related to school violence) and outcomes (related to academic success) to show its meaningfulness. LCGA yielded a five class solution showing the stability of anxious symptoms across adolescence. Class-invariant GMM suggested a four class solution characterized by developmental instability. Finally, GMM with class-varying parameters (which fitted the data better) produced a five-class solution showing both the stability of anxiety symptoms, and their instability at elevated levels. In addition to the substantive interpretation of these results, the discussion will also underscore the need to empirically verify invariance assumption in the context of LCGA/GMM studies.

Imagining the future: New developments in imagery in sport Part 1: Role and measurement of imagery ability in sport

Chair(s): MORRIS, T. (School of SES/ISEAL, Victoria University, Melbourne)
Discussant(s): SPITTLE, N. (Deakin University, Melbourne)

Imagery is a central pillar of psychological skills training (PST), a core component of sport psychologists’ practice. Imagery can facilitate learning/practice of skills, developing/rehearsing strategies, previewing/reviewing performance, managing psychological variables, and promoting recovery from injury/heavy training. Researchers have studied many aspects of imagery in sport. Practitioners have reported effective use of imagery in athletic contexts. Nonetheless, understanding how to apply imagery in sport is limited. One reason is that imagery cannot be observed directly; its operation is inferred from behavior or self-report. Also, because potential applications are diverse, few factors affecting imagery delivery have been rigorously examined. In this symposium, we present new developments on imagery in sport and movement, to enhance understanding of this ubiquitous technique. This is a two-part symposium. In Part 1, we focus on imagery ability. The foundation of the work on imagery presented in this symposium is that imagery is an effective technique that can benefit athletes. Thus, Paper 1 in the symposium reports on a new meta-analysis addressing the crucial issue of whether imagery works. The valid and reliable measurement of imagery ability is critical in research on imagery application to ensure that inferences derived from research outcomes are justified. Imagery ability is also crucial in practice because application of imagery must take into account athletes’ capacity to imagine across modalities and dimensions. Early measures showed limited

ecological validity. Watt, Morris, and Andersen (2004) developed the Sport Imagery Ability Measure (SIAM). Study of a Thai-language version reported in Paper 2, reflects on the robustness of the SIAM, for use with Thai athletes. Further evidence on the cultural and linguistic transferability of the SIAM is presented in Paper 3, which examines construct validity of a Hebrew-language version. The relationship between imagery ability and key sport-related variables is examined in Paper 4, signaling use of the SIAM in applied contexts. Paper 5 reviews the importance of experimental techniques to measure motor imagery ability. This symposium shows that imagery is an effective technique in sport and that imagery ability can be measured in ecologically-valid ways using the SIAM and experimental paradigms.

What you see is what you get: A meta-analytic review of the effects of imagery in sport and exercise domains

CURRAN, M. L. (University of Southern Queensland), TERRY, P. C. (University of Southern Queensland)

Imagery is often proposed to be an effective way to enhance the physical performance of athletes and exercisers. A meta-analytic evaluation of the extant literature was conducted to provide an objective assessment of the veracity of that proposal. Previous meta-analyses in the area have reported significant benefits of imagery, although the most recent of these was conducted more than 15 years ago, since when much additional research has been conducted. Search procedures, which included a systematic trawl of 14 electronic databases and manual searches of 12 relevant journals, identified a total of 205 relevant articles for detailed review. Of these, 108 studies met the inclusion and exclusion criteria and were included in the meta-analysis. Overall, 291 effects from 4,220 participants were derived from the studies. Using a random effects model, weighted mean effects and moderating variables were assessed via the Comprehensive Meta-Analysis software. The overall weighted mean effect ($d = 0.53$) indicated that imagery is associated with significant benefits to performance in sport and exercise. This moderate beneficial effect is similar to those reported in previous meta-analyses. Several moderating variables were identified. Males derive greater benefits from imagery ($d = 0.52$) than females ($d = 0.36$). Experienced participants derive greater benefits from imagery ($d = 0.52$) than novices ($d = 0.44$). Cognitive tasks, such as remembering complex routines, were enhanced more by imagery ($d = 0.98$) than strength tasks ($d = 0.36$) and motor tasks ($d = 0.46$). Imagery research published in Tier A journals reported larger effects ($d = 0.95$) than in Tier B journals ($d = 0.63$), Tier C journals ($d = 0.42$), and unpublished research ($d = 0.19$). The present findings have strengthened the evidence base for the use of imagery in sport and exercise domains. Used appropriately, imagery is typically associated with significant performance benefits. Given the larger effects reported in Tier A journals, where it may be assumed that tighter control of potential confounds has occurred, the true benefits of imagery may be greater than suggested by the overall effect found in the present meta-analysis.

Confirmatory factor analysis of the Thai language version of the sport imagery ability measure

VONGJATURAPAT, N. (Faculty of Sports Science, Burapha University, Bangsaen)

We report on translation of the English-language Sport Imagery Ability Measure (SIAM) into Thai language (SIAM-T), internal consistency, test-retest reliability, confirmatory factor analysis, and construct validity of the SIAM-T. The SIAM was translated into Thai by two bilingual Thai sport psychologists, back-translated to English by two bilingual Thai sport psychologists naïve to the English SIAM, checked by one of the Australian authors of the SIAM, amended by the original translators, back-translated again by the two original back-translators, and approved by the Australian author. The SIAM involves imagination of individual-specific versions of four generic sport scenes, each for 60 seconds, followed immediately after imagery of each scene by ratings on 12 subscales, six sense modalities
Symposia

GOLDZWEIG, G. (Academic College of Tel-Aviv-Jaffa, Tel-Aviv)

Imagery is used almost universally by athletes, coaches, and sport psychologists for a wide range of functions, including performance enhancement, management of psychological variables, and coping with sport injuries. Recently, there has been recognition of the need for valid and reliable measures of imagery ability. Such measures are valuable for both research and clinical practice. Thus, valid measures of imagery ability and its modalities may guide practitioners in applying different imagery methods and scripts. The aim of this study was to further examine the construct validity of a sport-specific measure of imagery, the Sport Imagery Ability Measure (SIAM). The SIAM is a task-oriented, multimodal, multidimensional imagery ability measure. The SIAM requires imagery of four generic sport scenes. Imagery is rated on 12 subscales, using 100mm analogue scales. In the current study, we present a further investigation of the predictive and construct validity of the Hebrew language version of the SIAM. The SIAM was administered to 85 Israeli college students. Participants were divided into 3 groups: local level athletes, amateur athletes, and non-athletes. The 12 subscales of the SIAM discriminated almost perfectly between the local level athletes (n=124) on all 12 subscales, which is consistent with research reporting greater imagery ability in more skilled performers. This study demonstrated that the SIAM-T is a sound Thai-language version of the original SIAM. The close similarity of findings for the SIAM-T to the original SIAM and Finnish, Swedish, and Hebrew versions suggests that the SIAM is a robust instrument, retaining its structure in a range of languages and cultures. Further research is needed to examine the sensitivity of the SIAM to imagery ability training and to examine the construct validity of the SIAM in different contexts.

A comparison of sport imagery ability clusters in relation to imagery use

JAAKKOLA, T. (Dept of Sports Science, University of Jyvaskyla)

This study analyzed imagery ability profiles based on the Sport Imagery Ability Measure (SIAM; Watt, Morris, & Andersen, 2004) and how these are related to imagery use of athletes. Additional aims were to explore the relationship of the profiles with participation level and sport type classification. It was predicted that high imagery ability athletes would report greater imagery use. Furthermore, because previous research has indicated different patterns of imagery use for sport participation levels and sport type classifications (e.g., Arvinen-Barrow et al., 2007; Watt, Spittle, Jaakkola, & Morris, 2008), we expected variations in imagery ability profiles. Participants were 484 individuals (280 male, 204 female; M age = 20.39, SD = 4.10), comprising 84 national, 210 state, 120 district, and 70 recreational level athletes from 54 sports. Participants completed a demographic information sheet, the SIAM, and the Sport Imagery Questionnaire (SIQ), and were classified according to competitive level (i.e., recreational, district, state, and international) and sport type (i.e., individual, co-active, interactive). We conducted K-Mean cluster analysis of the SIAM scores, and then used these profiles to compare differences in imagery use based on the SIQ, and sport participation level and sport type classification. Cluster analyses identified three imagery ability profiles: a “High ability profile”, a “Low ability profile”, and a “Mixed ability profile” (athletes high in generational attributes and low in the non-visual sensorial attributes). Significant differences were found between the cluster groups in imagery use. There was no significant difference for participation level categories, but we found a significant difference for the comparison based on sport type classification. Imagery ability profiles were identified that highlighted differences in imagery use patterns. The “High ability profile” athletes tended to use imagery more and play interactive sports. The “Mixed ability profile” athletes tended to use imagery more than the “Low ability profile”, and participate in individual sports. The “Low ability profile” athletes tended to use imagery less and participate in coactive sports. The results revealed that imagery ability profile may influence imagery use patterns and may be related to sports participation.

The development of motor imagery in children

WILLIAMS, J. (School of SES/ISEAL, Victoria University, Melbourne)

In this paper we explain the importance of experimental paradigms for measuring motor imagery in children, review research on the link between poor motor imagery and motor skill deficits, and consider the importance of age-related findings on motor imagery ability in children. Experimental motor imagery paradigms are believed to allow us to gain an understanding of an individual’s ability to represent movements internally (Jeannerod, 2001). This is an important component of movement planning, allowing us to accurately predict the outcome of a given movement and thereby providing the foundation to select the most appropriate action to achieve a particular goal. These paradigms, widely-used with adult populations, are increasingly being used to explore the development of motor imagery in children (Caeyenberghs, Tsoupas, Wilson, & Smits-Engelsman, 2009; Caeyenberghs, Wilson, Van Roon, Swinnen, & Smits-Engelsman, 2009). They have also been used to link motor skill deficits in children with possible motor imagery deficits, with the argument being that poor motor imagery ability may be one cause of poor motor skills (Williams, Thomas, Maruff, & Wilson, 2008; Wilson et al., 2004). We will review this research here, beginning with a description of the paradigms used. We will then discuss the typical response patterns observed in adult groups and how children perform in comparison, including age-related findings and those relating to children with motor skill impairment. We will also discuss motor imagery training and its application to younger groups (Wilson, Thomas, & Maruff, 2002). The review will also consider the difficulties associated with the use of these
paradigms in children, such as compliance with task instructions, and how research can be improved to overcome such difficulties. The experimental measurement of motor imagery ability in children is an important step toward the goal of treating children with motor impairments. The objective of this presentation is to inform researchers and practitioners about the potential of this approach to help us understand the development and functioning of motor imagery in children, leading to new methods for treating motor impairment.

Imagining the future: New developments in imagery in sport Part 2: Issues in the delivery of imagery training in sport

Chair(s): SPITTLE, M. (School of Exercise and Nutrition Sciences, Deakin University)

Imagery is a central pillar of psychological skills training (PST), a core component of sport psychologists’ practice. Imagery has many functions, including facilitating the learning/practice of skills, developing/rehearsing strategies, previewing/reviewing performance, managing psychological variables, and promoting recovery from injury/heavy training. Despite substantial research and practice, understanding how to apply imagery optimally in sport is limited, because imagery cannot be observed directly, so its operation is inferred from behavior or self-report. Also, potential applications of imagery are diverse, so few factors affecting imagery delivery have been rigorously examined. In this symposium, we present new directions in research on imagery in sport, to enhance understanding of this ubiquitous technique. This is a two-part symposium. In Part 2, we focus on issues related to imagery delivery. Given the diversity, yet fragmented nature, of imagery research in sport, there is potential for a model providing guidance on issues to consider in developing imagery programs. Paper 1 examines a generic Imagery Training Program (ITP) Model and research that should be undertaken to test the ITP model. Paper 2 presents a qualitative exploration of the development and use of an ITP by elite-level golfers. In practice, imagery is widely used with open-skill tasks, but research has not examined whether athletes can imagine unpredictable events in sport. Paper 3 reports a study that used Hicks Law to address this question. Mahoney and Avener (1977) distinguished between internal (actor’s view) and external (observer’s views) imagery perspectives. There has been little consideration in sport of how
imagery perspectives develop. Morris and Spittle (2001) proposed a default hypothesis of imagery perspective development. In Paper 4, we present the default hypothesis and propose research directions to examine it. To understand the impact of internal and external imagery, in Paper 5, these perspectives were studied for the observation and imitation of movements presented from internal and external views, thus, varying stimulus-response compatibility. Key objectives of this symposium focus on the search for understanding of key processes in imagery delivery, which should stimulate research on important questions to enhance imagery use in sport.

Developing imagery interventions in sport: The Imagery Training Program Model

WATT, A. (School of Education/ISEAL, Victoria University, Melbourne), MORRIS, T. (School of SES/ISEAL Victoria University), SPITTLE, M. (School of Exercise and Nutrition Sciences, Deakin University)

We present a generic model developed to help practitioners consider appropriate variables when they design imagery training programs (ITP) for athletes. We suggest research to test the ITP model. Athletes, coaches, and psychologists employ imagery widely. Many theories have been proposed, but none has unequivocal support. Researchers have studied numerous variables related to imagery effectiveness, producing a mass of largely uncoordinated information of varying use to practitioners using imagery with athletes. Morris, Spittle, and Watt (2005) proposed an Imagery Training Program Model to guide the development of imagery programs. Because of the diversity of specific research, the ITP Model is generic, directing practitioners to examine the latest research on variables categorized under six components. Prerequisites are preexisting personal factors and the Environmental component represents aspects of the context to consider. Those components influence Content, which refers to the material in the program; Rehearsal Routines, which covers when and how imagery is practiced; and enhancements, which relates to imagery facilitators, such as video modeling or biofeedback. The final component, Evaluation, can take many forms and should start soon after athletes begin working with the ITP their psychologist develops with them. The ITP model visually depicts relationships between the preexisting components, the structural components, and evaluation. The ITP model was developed during extensive review of research on imagery in sport, but has not been tested. Exploratory research should explore experiences of ITP developers and users. We report such a study in golf in this symposium. Research on the ITP model’s utility in imagery program design, should test predictions concerning relationships between specific components. To do this, particular variables must be used as exemplars of components, but emphasis is on the components, not the exemplar variables. We illustrate this kind of research. The ITP model has potential to facilitate imagery program development and enhance imagery effectiveness. Our objectives are to stimulate researchers to test the ITP model and practitioners to apply it in ITP development, leading to refinements of components and the development of new elements.

Keywords: imagery, sport, imagery, athletes, imagery

A qualitative analysis of golfers’ imagery use and imagery abilities

KOKKONEN, J. (Dept of Sports Science, University of Jyvaskyla), WATT, A. (Victoria University, Melbourne)

The primary goal of this study was to examine the verbal descriptions of elite golfers’ evaluation of their imagery use and their ability to generate and manipulate sport-related imagery. A secondary aim was to use the qualitative data to construct personalized imagery scripts to be used within a short Imagery Training Program (ITP) (Morris, Spittle, & Watt, 2005). Participants were three elite level Finnish golfers. The sample comprised one male and female from the European professional ranks, and one male ranked in the top-twenty Finnish amateurs. Players completed the Sport Imagery Ability Measure (SIAM) and Sport Imagery Questionnaire (SIQ) as a preliminary assessment of their imagery skills. Structured interviews were undertaken
individually over a one-hour period. The framework for the interview schedule was aligned with the qualitative studies of Moran and McIntyre (2007), in which the sport imagery use descriptions of Olympic level slalom canoeists were analyzed. Thirteen questions focused on the players use of imagery in relation to the development and performance of physical skills and in their use of imagery for psychological preparation, six questions referred to the generation and manipulation of images, three items addressed general information concerning imagery, and three questions sought specific information about the performance areas the player would like to address within an ITP. The imagery scripts were developed in consultation with each player and involved 20 5- to 10-minute sessions, completed over four weeks at times convenient to each player. Interview data was examined using content analysis that targeted the identification of text segments related to the why, what, and when themes of sport imagery. Results indicated the players used imagery more for the development of physical skills within training regimens than for psychological preparation in competition. They were also capable of providing specific imagery goals for the scripts and reported that the process of working with the researcher to develop content facilitated engagement in the ITP. Imagery appears to be a psychological technique for performance preparation that the small sample of golfers understood and were able to incorporate within their training and playing routines.

Keywords: golfers, imagery, imagery, sport, performance

Imagining unpredictable stimuli: Implications for the applied use of imagery

MCNEIL, D. (Ballarat University, Victoria), SPITTLE, M. (Deakin University, Melbourne), MORRIS, T. (Victoria University, Melbourne), EVANS, S. (University of Ballarat), MESAGNO, C. (University of Ballarat)

In applied settings, such as sport, imagery is often used to practice tasks with unpredictable stimuli, such as the actions of other players or the movement of the ball. However, one question that remains unanswered is whether it is possible to imagine reacting to unpredictable stimuli. The aim of the study, thus, was to investigate whether performers can effectively imagine an unpredictable stimulus. This study examined differences on a reaction time (RT) task in visual and imagery conditions using Hick’s Law as a framework. Essentially, Hick’s Law suggests that RT will increase as a task becomes more unpredictable. Based on this, it was hypothesized that the imagery and visual conditions would be functionally equivalent. That is RT in each condition would increase as the number of response choices increased, in accordance with Hick’s Law. 50 (25 female, 25 male) participants (M age = 21.76 years, SD = 1.64) completed 20 trials of a simple, 2-choice RT, and 4-choice RT task in both a visual and an imagery condition. In the visual condition participants responded to a visual stimulus displayed on a screen and in the imagery condition participants were instructed to imagine the stimulus and respond. RT increased significantly with response choices in the visual condition (F(2, 48) = 235.322, p<0.001, η² = .91), however, there was no significant change for the imagery condition (F(2, 48) = 2.608, p > .001, η² = .10). Simple RT for the imagery condition was significantly higher than for the visual condition (t(49) = 7.40, p<0.001, η² = .53). RT conformed to Hick’s Law for the visual condition, but not for the imagery condition. This suggested that participants in the imagery condition did not recreate unpredictability in their imagery. It did, however, appear that participants were imagining the task, since it was taking time to generate an image. One interpretation may be that imagery of the task was pre-planned, removing the unpredictability of the stimulus. This has applied implications, since it seems to be difficult to practice unpredictable elements of a task in imagery. This should be explored further.

Keywords: sport, imagery, unpredictable stimuli, reaction time, visual conditions

Is internal imagery the default perspective and why does this matter?
MORRIS, T. (School of SES/ISEAL, Victoria University, Melbourne), SPITTLE, M. (Deakin University)

We present the case for a default hypothesis of imagery perspective, considering research that illuminates this hypothesis and implications for the application of imagery in sport. Mahoney and Avener (1977) proposed that athletes imagine from two perspectives. Internal imagery is experienced from the actor’s perspective, so individuals experience all the senses as if they are in their body performing. External imagery is experienced from a range of perspectives outside the body, so, the visual experience is like watching oneself on video from any angle, even improbable positions. Many practitioners focused on the internal perspective, which Mahoney and Avener favored. Further research has supported the internal perspective, the external perspective, found no difference between perspectives, or argued for use of both perspectives. To apply imagery perspectives effectively, we must understand how each functions in various sports contexts. One issue not widely considered is how imagery perspectives develop. Morris and Spittle (2001) proposed a default hypothesis of imagery perspectives, arguing that infants imagine from an internal perspective, consistent with the Piagetian egocentric view of early intellectual development. Morris and Spittle posited that the external imagery perspective develops on the basis of children’s experience of perceiving themselves as others perceive them, for example, in mirrors or on film. Little research has been conducted in sport testing this default hypothesis, but several sources of evidence provide insight into the proposition. We discuss this evidence. Further, the default hypothesis leads to predictions about the use of imagery perspectives in children and adults. Research examining these predictions in sport could be fruitful for understanding how internal and external imagery perspectives develop and when they are likely to be most effective in sport contexts. We propose several research directions to enhance understanding of the development of imagery perspectives. Understanding how imagery perspectives develop will help practitioners to apply internal and external imagery more effectively in their work with athletes. The objective is to inform and stimulate researchers and practitioners to systematically examine predictions of the default hypothesis of internal and external imagery perspectives.

Keywords: imagery, sport, performance, internal perspective, Piagetian egocentric view

Internal and external imagery perspectives and physical movement

THANIKKAL, S. (School of SES/ISEAL, Victoria University, Melbourne), MORRIS, T. (Victoria University, Melbourne)

The aim of the present study was to compare internal and external imagery processes and physical movement in response to visually-displayed finger movements, to test the viability of using this task to examine mirror neuron functioning, monitored by EEG, during internal and external imagery. We screened student volunteers for internal and external imagery use on the revised VMIQ II, including only the 22 participants who scored moderate to high on both imagery perspectives. We presented video clips from two views, namely internal (finger moved away from the observer), and external (finger moved toward the observer). The video clips showed an index finger moving from a white, triangular ready key to press one of four blue, rectangular response keys on a custom-built keyboard. We exhibited 8 video clips in random sequences, showing movement to each response key from an internal and an external view. Participants watched the video clips in three research conditions, namely movement, internal imagery, or external imagery, and responded as quickly as possible by moving or imagining moving to the response key in the video clip, depending on the condition. In each condition, there were 10 practice trials and 40 test trials. We recorded decision and movement times for physical movement and overall response time for internal and external imagery conditions. For physical movement, decision time, $t=13.51, p<1$, and movement time, $t=4.83, p<1$, were significantly faster for the highly compatible internal view. Response times for physical movement were significantly faster than for both imagery conditions, $F=58.58, p<.001, \eta^2=.85$. There was a significant ordinal interaction for the imagery conditions and...
views, $F=34.56$, $p<.001$, $\eta^2=.78$. The highly compatible internal view was faster for internal imagery, whereas the highly compatible external view was faster for external imagery. The significant compatibility effect for physical movement was predicted. Identification of opposite compatibility effects for internal and external imagery indicates that the task distinguished between internal and external imagery processes. These results suggest this task has potential for examining mirror neuron activity (inferred from EEG Mu rhythms) associated with observing, physically imitating, and imagining movements.

Implications of the international classification of functioning, disability and health on rehabilitation science and services

Chair(s): OAKLAND, T. (University of Florida)

A primary goal of rehabilitative service is to either improve or maintain functioning or, at the very least, decrease its rate of deterioration. The success to which service goals are achieved may require an understanding of an individual’s functioning in multiple functional life situations (e.g. in one’s home, work, school, and other community settings). Rehabilitation and health assessment data are needed to address three broad issues: whether an individual is benefiting from care, whether the science and practice of rehabilitation and health care services are improving, and whether we can identify the conditions that lead to more effective and efficient services. This symposium discusses the World Health Organization’s (WHO) International Classification of Functioning, Disability and Health (ICF) as a framework for understanding rehabilitation and health assessment. The influences of context, process, and technology on assessment priorities, methods, and outcomes also are considered. Key learning objectives are to promote an understanding of: (1) the ICF model and its important implications for rehabilitation services; (2) major contributions of ecological models to assessment of environmental facilitators and barriers; (3) differences between environmental features and personal attributes; (4) the interactive effects of capacity and environmental attributes on performance outcomes; (5) the importance of measuring demand-producing environmental attributes in using environmental interventions to enhance rehabilitative methods; (6) differentiating quantitative and qualitative approaches to neuropsychological assessment and understand the pros and cons of each; (7) factors that may influence test performance and/or alter the
basic interpretation of test data; (8) the ICF’s applications to neuropsychological assessments in rehabilitation and health settings; (9) the impact of culture in critical areas of neuropsychological assessment; and (10) the underlying importance of values in the provision of rehabilitation services.

International Classification of Functioning (ICF): Its review and general implications for rehabilitation services

OAKLAND, T. (University of Florida)

This paper introduces essential features of the International Classification of Functioning (ICF) and outlines ways the ICF can be useful to the promotion of the science and practice of rehabilitation and health care services, including care for patients receiving rehabilitation services. The World Health Organization’s (WHO) ICF provides a framework for viewing behaviors from three broad and different perspectives: physiologic, physical, and psychological functions; the extent to which persons engage in functional life activities; and their participation in social settings. The ICF does not emphasize pathology or lead to a diagnosis. However, the ICF can be used as a companion to the WHO’s International Statistical Classification of Diseases and Related Health Problems, Tenth Edition (ICD-10; WHO, 1992) when diagnosing disorders. The ICD-10 provides a system for classifying and diagnosing health conditions, including diseases, disorders, and injuries based on etiology. In contrast, the ICF emphasizes a client’s full and accurate description, not diagnosis, based on medical and social models of disability through biological, individual, and social perspectives of health. When a diagnosis is needed to obtain benefits, the ICD-10 may be used to classify a client’s disability. The combined use of the ICF and ICD-10 provides for more comprehensive descriptions and is useful for program planning and intervention services. The ICF places considerable emphasis on identifying functional impairments and thus strongly emphasizes the importance of adaptive behavior. Specifically, its activities and participation components address the execution of a task or action by an individual and his or her involvement in life situations. The term activities refer to tasks or actions a client is able to perform. Examples for older children and adults include writing, talking, and calculating. The term participation refers to activities that become integrated into one’s life. Examples for children include regularly taking others to nearby places, talking by telephone with family and friends, and refraining from embarrassing others. This paper discussed important implications of the ICF for the provision of rehabilitation services, including the manner in which disabilities are viewed, assessed, and addressed through research, interventions, and follow-up evaluations. Few psychologists are familiar with the ICF model. This session is intended to introduce the model to psychologists unfamiliar with it and show possible implications of the model for those engaged in rehabilitation science and services.

The impact of personal values on one’s participation in the community among persons with chronic illness or disability

MPOFU, E. (University of Sydney)

This study investigated consumer values that influence their Community and Independent (CIL) preferences. Knowledge of consumer CIL is central to service delivery, and particularly in view of the self-determination and consumer oriented philosophy that informs CIL outcomes. The WHO International Classification of Functioning, Disability and Health (ICF) consider activity and participation in community settings important indicators of superior rehabilitative interventions. Sixty-eight individuals with disabilities from four centers for Community and Independent Living (CILs) participated (67% female, 25% with cardiovascular conditions, 60% with neuromuscular or musculoskeletal related disabilities, 15% other health conditions). They responded to an open ended statement probe to nominate important values influencing their choice of community living options. Data were analyzed using a mixed method ethnographic approach to construct informant centered
value maps important for guiding counseling for community and independent living choices by CILs. The analysis took into account severity of disability. Individuals with significant or comorbid conditions prioritized service and community access issues relatively more than did those with less complex health conditions. Across disability groupings, informants ascribed importance to participation with social others, including involvement in community leisure activities. Disability friendly laws were considered significant to supporting efforts to secure preferred community living options. CIL solutions values by consumers with disabilities are those that enabled activities and participation for social inclusion. Consumers with disabilities have preferences for CIL they believe to reflect their values, and are important for social inclusion interventions.

An International Classification of Functioning (ICF)-based model for assessing environmental barriers and facilitators to activity and participation

STANFORD, J. (Georgia Technical University)

The aim of this study was to present an International Classification of Functioning (ICF)-based model of environmental assessment that incorporates the interactive effects of person (i.e., body function and structure) and press (i.e. environmental barriers and facilitators) on performance (i.e., activity and participation). Although there are a large number of methods used to assess environmental contributions to performance, few adequately address the key person, press, and performance factors that are essential to developing effective environmental interventions. Further, assessment methods vary significantly in the comprehensiveness of information that is collected and how that information is used in determining environmental intervention. This presentation draws from the ICF, current literature on environmental assessment, and ecological models of person-environment interaction to propose a comprehensive model that builds and expands on the relationship capacity and contextual factors as they define barriers and facilitators and impact activity and participation. Specifically, differences in understanding of the interactions among the key constructs will be reviewed, leading to the development of a model that incorporates and accounts for the interrelationships among these key factors. Analysis of existing models suggested the degree to which the environment acts as a facilitator or barrier to activity and participation can be assessed only in relation to an individual’s capacity and his/her performance outcomes. Thus, an assessment model that accounts for the interactive effects of body function/structure and strength of environmental demands (i.e., press) on activity and participation was developed. Press includes individual factors, such as preferences and values; environmental factors, including physical factors (e.g., attributes of space and products); social factors (e.g., values), and organizational factors (e.g., policies); external factors (e.g., legal restrictions, availability of interventions) outside the control of the individual; and task factors, such as requirements of the activity (e.g., lifting, pulling, and bending). The proposed model provides a framework for gathering information that is comprehensive, reliable, and valid. Such information is essential for the elimination of environmental barriers, and the promotion of environmental facilitators are to provide effective rehabilitation strategies.

More than just test scores: Holistic neuropsychological assessment utilizing the International Classification of Functioning (ICF) framework”.

LEBLANC, J. (Private Practice)

The aim of this study was to review the strengths and weaknesses of quantitative versus qualitative neuropsychological assessment approaches and the meaning of neuropsychological assessment in the context of the International Classification of Functioning (ICF). Current literature regarding meaningfulness of neuropsychological assessment for individuals in a health-care setting will be reviewed in the context of the
ICF framework. The presentation emphasizes neuropsychological assessment’s effectiveness for measuring an individual’s abilities related to body structures, body functions, identification of limitations and abilities in activities and participation, and the individual’s ability to perform in major life areas such as work and education. The merits and limitations of utilizing qualitative and quantitative methods of neuropsychological evaluation are reviewed. A brief representation of assessment methods for providing both qualitative and quantitative information for all major aspects of cognition will be presented, with an emphasis upon their ecological validity in respect to prediction of functional skills. The functional implications of considering assessment from a holistic perspective, including consideration of the individual’s culture or other, will be emphasized. Qualities that may impact test performance also are identified. Finally, the role of the rehabilitation neuropsychologist in the context of the treatment team is outlined, including methods for increasing the effectiveness of the rehabilitation team’s efforts. Neuropsychological assessment in the rehabilitation and other health-related settings provides information for various needs, including diagnosis, treatment planning and intervention, and establishment of competencies. Many aspects of ICF classification are pertinent for neuropsychological assessment. Obtained data are meaningful only in a person’s holistic context.

**Improving employee engagement, well-being and performance: New tools, interventions, and solutions**

Chair(s): MACHIN, T. (University of Southern Queensland)

Discussant(s): FOGARTY, G. (University of Southern Queensland)

This symposium will focus on developing better tools, interventions, and solutions to improve important individual and organizational outcomes such as engagement, well-being, and performance. The presenters will represent developments from three continents (Australia, North America, and Europe). The key learning outcomes are: (1) To increase the awareness of researchers of the critical factors that influence employees’ engagement with organizational initiatives; (2) To provide managers with solutions that impact positively on organizational and employee well-being; (3) To assist employees to better understand the impact of organizational variables on their well-being and performance; (4) To encourage the deployment of interventions that impact positively on employees’ well-being and performance.

**Establishing links between organizational climate, employee well-being and historical patient outcomes**

MACHIN, T. (University of Southern Queensland), GOH, H. E. (University of Southern Queensland), PATRICK, J. (University of Southern Queensland), JURY, C. (Queensland Health)

This research undertaken in collaboration with Queensland Health analysed the links between dimensions of workplace climate/employee well-being contained in a number of Queensland Health databases, including the Patient Satisfaction Survey, the Clinical Incident database, the compliments and complaints database, the Variable Life Adjusted Display
Symposia

Abstracts of the 27th International Congress of Applied Psychology

(VLAD) Database and the Better Workplaces Staff Opinion Survey database. Queensland Health sought to identify in what ways workplace climate is related to patient outcomes using existing datasets collected within the Queensland Health Centre for Healthcare Improvement. The process of establishing links involved matching aggregated data for specific facilities (where possible), or failing that, larger facilities (e.g. Hospital), or the Health Service District. Once the datasets had been matched on location or facility, correlations were calculated between the aggregated scores. The results demonstrated links between the data sets. These links showed that a better workplace climate is associated with greater reported numbers of clinical incidents, especially “no harm” clinical incidents. There was also a link between workplace climate and patient compliments/complaints which show that unsolicited compliments received from patients and their families are clearly related to a number of positive aspects of workplace climate (workplace morale, role clarity, and appraisal and recognition) and individual morale. The results linking workplace climate and patient satisfaction showed that there is a strong positive relationship between overall patient satisfaction and role clarity, and a negative relationship between overall patient satisfaction and both workplace distress and excessive work demands. While these results relate to historical data and therefore should not be construed to reflect the current state of operation within Queensland Health, they are still indicative of some very important relationships. This is the first study to demonstrate that more positive clinical management practices, better perceptions of the workplace climate and better employee well-being are a reflection of a better incident reporting and learning culture in a health care organization, ultimately resulting in improved patient outcomes.

**Keywords:** climate, well-being, Queensland Health, job demands, patient outcomes

**Alleviating burnout through enhancing civility among colleagues**

LEITER, M. (Acadia University), LASCHINGER, H. S. (University of Western Ontario), DAY, A. (St Mary's University), GILIN-OORE, D. (St Mary's University)

Hospital units implemented CREW (Civility, Respect, and Engagement with Work) to enhance collegiality. The research evaluated the impact of the procedure on collegial and supervisory relationships, attitudes towards work, job burnout, and work engagement. We implemented surveys before and after the CREW process on the eight intervention units and 32 control units. The survey assessed collegiality (civility and incivility among colleagues), job burnout, attitudes (commitment, satisfaction), perceptions of worklife (workload, control, reward, community, fairness, and values), and absences. The CREW process was implemented through weekly sessions facilitated by hospital personnel with mentoring from research staff. CREW units improved across the full range of measures. For example, a MANOVA for the Intervention group on the social context variables-civility, coworker incivility, supervisor incivility, instigated incivility, and respect-produced a significant improvement from Time 1 to Time 2 (F(5,413) = 6.271, p < .001, η = .070). A 2 X 2 MANOVA for the social context variables produced a significant interaction of Time with Intervention (F(5,1958) = 3.25, p = .006, η = .008), confirming a greater improvement in civility among intervention participants. Further, a MANOVA for the Intervention group on the burnout measures—exhaustion and cynicism—and turnover intention—produced a significant improvement from Time 1 to Time 2 (F(3,418) = 11.58, p<.001, η = .077), and a 2 X 2 MANOVA for the burnout and turnover intention variables produced a significant interaction of Time with Intervention (F(3,1977) = 3.066, p=.027, η = .005). The results confirm that the CREW process has a significant impact on the quality of interaction among colleagues. The results further support the proposition that improvements in psychological connections with work, job attitudes, and job behaviors accompany these changes in collegiality. The discussion considers the implications for the CREW process and for collegiality for workplace health. The discussion also considers the pivotal role of collegial relationships in the
development of employees’ psychological connections with their work.

Keywords: work engagement, job burnout, collegiality, job attitudes, civility

Enhancing career management and well-being in changing organizations

VOURI, J. (Finish Institute of Occupational Health), TOPPINEN-TANNER, S. (Finish Institute of Occupational Health)

Individuals need resources to cope effectively, and confidence in their ability to succeed in changing organizations and to endure job insecurity. Career management and well-being can be improved by developing coping skills and abilities related to career goal setting and attainment. Preparedness for work life transitions can be increased with group interventions applying techniques of social modeling and active learning. Preparedness means readiness to respond to uncertain outcomes and it enables coping in stressful continuous work life uncertainty or involuntary transitions. For enhancing employees’ coping and well-being during organizational changes we developed a group intervention to promote career management preparedness. We aimed to study the effects of the group intervention on well-being, job engagement and work career. The effects of the group intervention were investigated in a randomly assigned field experimental study (RCT-study) during 2006 - 2008 in 17 organizations, involving 718 participants. The mean age of the participants was 50.5 years (SD = 6.5) and 88 % of them were women. After the T1 baseline measurements the study comprised three follow-up questionnaires: T2 at the end of the intervention, T3 7-month after the intervention and T4 1.5 years after the intervention. The response rate at T3 was 85.4 %. The proximal effects show a very significant increase in career management preparedness and work life goals among the group participants compared to controls. The 7 month follow-up results of the experiment demonstrated that the intervention significantly decreased symptoms of depression. The intervention also had a conditionally significant beneficial effect on job engagement. The group intervention most benefited those employees who were at risk of depression. In summary, enhancing career management preparedness in changing organizations has beneficial effects on work goals and well-being, especially among those at risk.

Keywords: career management, career goals, job engagement, changing organizations, well-being

The role of health and well-being in safety performance

FOGARTY, G. (University of Southern Queensland)

Descriptive models of how accidents occur are now commonplace in the aviation industry. These models are useful for guiding accident investigation teams and for helping to decide what changes need to be introduced to reduce the possibility of further accidents. However, from a psychological point of view, what has been lacking in the field is an empirical model that links organizational constructs such as safety climate with individual variables such as psychological health and then shows how both of these combine to influence important performance outcomes such as workplace violations and errors. The aim of this research program was to develop and test such a model. The context for this research program was the field of aviation maintenance, where errors and violations represent an extremely serious threat to safety. A multivariate approach was used wherein data collected from safety climate surveys were used to test structural models linking climate, health, and performance. The first study focused on the link between safety climate, health, and maintenance errors. The results suggested that safety climate does not have a direct effect on errors but has a strong indirect effect via the psychological health experienced by individual workers. A second study replicated this finding. A third study extended the model to include workplace violations and demonstrated that the link between violations and errors is not as strong as some might think. This third study also reinforced the causal chain running from safety climate, through psychological health, to errors. At the same time, it showed a strong direct link between safety climate and violations. Health and well-being are often explored in the context of positive work outcomes such as commitment and tenure,
where they have been shown to contribute useful variance. This series of studies shows that they are just as useful when exploring negative outcomes, such as errors in high risk industries. The paper concludes with recommendations as to how these empirical findings can be used to support ongoing initiatives in safety training.

Tailoring interventions for those in most need: Grouping employees by burnout and engagement

TIMMS, C. (Griffith University), BROUGH, P. (Griffith University)

The experience of either workplace engagement or psychological burnout has profound consequences for both individual well-being and organizational productivity. Most engagement and burnout research however, is based on aggregated data, which overlooks the insights to be gained from specific individual perspectives. The current research aimed to group respondents according to their specific burnout and engagement responses and to identify the resulting group similarities of workload, job control, reward, community, fairness and values (Areas of Work-life Survey, AWS). The research aimed overall, to illustrate the work perceptions of the most at-risk workers, with a view to tailoring interventions specifically for the employees in most need. Three independent samples of employed workers in Australia responded to a survey. Samples one \((n = 255)\) and three \((n = 706)\) were employees of an education union and sample two \((n = 260)\) was a mixed group of employees representing a number of organizations. The Oldenburg Burnout Inventory (OLBI) and the Utrecht Work Engagement Scale (UWES) were employed to classify respondents in respect to the similarity of their responses using K-means cluster analysis. Subsequently differences between groups in regard to the AWS were confirmed using MANOVA analyses. The cluster analysis identified five specific groups of respondents who were most like-minded in regard to burnout and engagement: Empowered, Under-pressure, Unengaged, Burnout and Severe Burnout groups. Employees within these five groups demonstrated distinct similarities in regard to their scores of workload, control, reward, community, fairness and values.

Improving treatment for individuals with co-occurring mental health and substance use disorders

Chair(s): STAIGER, P. (Deakin University)

Studies across the US, UK, Europe and Australia have consistently reported high levels of comorbidity between mental health problems and substance use issues. The co-existence of these problems tends to lead to greater impairments in physical and mental health functioning, poorer psychosocial and day-to-day functioning, increased use of treatment and service resources, greater levels of treatment non-compliance and poorer treatment outcomes. This symposium includes a range of national and international studies which focus on improving treatment outcomes for individuals with co-occurring mental health and substance use disorders. The symposium includes findings from four randomised controlled trials (RCT), a review on best practice for treatment of anxiety and substance use problems and a study focussed on developing a responsive and coordinated service delivery model for dual diagnosis clients. The first paper reports on the evaluation of the Family Intervention for Dual Disorder program. This family intervention integrates the treatment of severe psychiatric disorders and addictive disorders. The presentation will report on outcomes of this multi-site RCT. The second paper is also an evaluation of an integrated treatment program, this time with a specific focus on depression and substance use problems. The findings from two RCTs will be presented. The third paper reports on findings from an integrated treatment for post-traumatic stress disorder, finding clear evidence that it is safe and efficacious to conduct exposure therapy for PTSD among individuals with substance use problems. The fourth paper will report on a review of effective treatments for comorbid anxiety and substance use problems and suggests possible mechanisms underlying this comorbidity which may require specific attention during treatment. The final paper reports on findings from a study funded by beyond blue which focused on developing a responsive and coordinated service delivery model. 97 individuals with comorbid high prevalence mental health problems and substance use problems were interviewed to ascertain treatment needs and experiences, in addition to reporting on their mental health and substance use characteristics.

Family psychoeducation with patients who have co-occurring substance use disorders and severe mental illness

MUESER, K. (Dartmouth University)

Substance abuse has a negative impact on the course of schizophrenia and bipolar disorder, including precipitating relapses and worsening social and global functioning. Despite the development and empirical validation of different family intervention programs for severe mental illness, little attention has been paid to the development of such programs that target the integrated treatment of severe psychiatric and addictive disorders together. To address this need, we developed and evaluated a family program to treat these comorbid disorders. The Family Intervention for Dual Disorder (FIDD) program was developed for persons with severe mental illness and substance abuse. The FIDD program includes a combination of psychoeducation about dual disorders, motivational interviewing, communication skills training, and problem solving training, delivered over 12-18 months. To evaluate the impact of the FIDD program, a randomized controlled trial was conducted at two sites (in Boston and Los Angeles) comparing families randomized to the FIDD program or a brief (6-8 sessions) family psychoeducation program. A battery of assessments was conducted at baseline and every six months for three years. A total of 108 persons with dual disorders and a key family member were recruited into the study and randomized to receive either the FIDD program or the brief family psychoeducation program. Rates of engagement in both family programs were high, 88% and 84% for FIDD and brief family psychoeducation, respectively, but rates
of longer term retention and exposure to the core elements in each model were lower, 61% and 55%, respectively. The comparative effects of the two family intervention programs over the three year study period are currently being analyzed. This presentation will summarize those outcomes, with a focus on substance abuse, psychopathology, family knowledge about mental illness, family burden and quality of relationships, and social problem-solving. The implications of the findings for the role of the family in the treatment of persons with co-occurring severe mental illness and substance use disorders will be discussed.

Two randomised controlled trials of CBT for co-existing depression and substance use problems

BAKER, A. (University of Newcastle)

Depression and alcohol/other drug (AOD) use disorders often co-exist, presenting challenging treatment issues for AOD and mental health clinicians. This paper describes two randomised controlled trials evaluating cognitive behavioural therapy (CBT) for co-existing depression and AOD use problems: the SHADE (Self-Help for Alcohol/other drug use and DEpression) and the DAISI (Depression and Alcohol Integrated versus Single-focused Interventions) projects. These studies represent the first large randomised controlled trials of CBT for co-existing depression and AOD use problems. The SHADE project compared 10 sessions of therapist delivered and computer delivered CBT with 10 sessions of person-centred therapy. The DAISI project compared integrated (depression and alcohol) with single focused (depression versus alcohol) interventions and a brief intervention. This paper describes the post-treatment and follow-up results of both trials.

Keywords: depression, alcohol, cognitive behavioural therapy, comorbidity, person-centred therapy

Is exposure therapy for post traumatic stress disorder (PTSD) efficacious among people with substance use disorders (SUD)? Results from a randomised controlled trial

MILLS, K. (National Drug and Alcohol Research Centre, University of New South Wales)

To evaluate the efficacy of an integrated treatment for post traumatic stress disorder (PTSD) (incorporating imaginal and in vivo exposure) among people with substance use disorders (SUD). 103 participants were recruited from SUD treatment services and community referrals in Sydney, Australia (83% response rate). Participants were randomly assigned to receive either i) integrated treatment (IT) for SUD and PTSD (n = 55); or ii) treatment as usual (TAU) for their SUD (n = 48). Components of the IT included psychoeducation, cognitive behavioural therapy (CBT) for SUD and PTSD, imaginal and in vivo exposure. Participants completed interviews at baseline, 6-weeks, 3- and 9-months follow-up. Over 70% of the sample was re-interviewed at each time point. Intention-to-treat analyses were conducted comparing the outcomes of those who received the IT versus TAU. The mean age of the sample was 35.7 years and 62% were female. The most commonly used substances were benzodiazepines (73%), cannabis (69%), alcohol (67%), heroin (45%) and amphetamines (42%). All participants met DSM-IV criteria for substance dependence and PTSD. The most commonly reported traumas involved physical or sexual assault. Over 75% had experienced childhood trauma; 55% reported childhood sexual abuse. Over the 9-month follow-up period, both the IT and TAU group evidenced reductions in their substance use, however, these were more pronounced in the IT group. The IT group also demonstrated substantial improvements in relation to the frequency and severity of PTSD symptoms, whereas the TAU group demonstrated little change in relation to these outcomes. Contrary to popular belief, exposure therapy for PTSD is safe and efficacious among individuals with SUD.

Comorbidity between anxiety and substance use disorders is common yet it is poorly understood and poorly treated.

BAILLIE, A. (Macquarie University)

There are few well conducted treatment outcomes trials for comorbid anxiety, mood and substance use disorders. Some recent (2005-2009) outcome literature has focused on specific mechanisms (anxiety sensitivity and tension reduction alcohol expectancies) that may underlie comorbidity between anxiety, mood, and substance use disorders and may lead to more targeted intervention. The research based for understanding and treating comorbid anxiety, mood, and substance use disorders needs to be broadened. In particular research with a focus on i) specifying particular comorbid relationship between, ii) the mechanisms that may underlie and maintain those relationships, and iii) well conducted evaluations of treatments that target those mechanisms.

Keywords: comorbidity, anxiety, mood disorders, substance use disorders, interventions

Improving pathways of care for individuals with co-occurring depression/anxiety disorders and substance use problems

STAIGER, P. (Deakin University)

It has been argued that many clients with co-occurring mental health and substance use disorders (dual diagnosis) are falling between the gaps of the health care system resulting in poor long-term outcomes for these individuals. This is particularly the case for those individuals with anxiety and depressive disorders as they are often excluded from accessing mental health services. The rationale behind this project was that careful and informed planning is required in order to develop clear pathways of care between primary and secondary services. 97 individuals with a dual diagnosis participated in an interview which examined the psychosocial and medical characteristics of this group. Thematic analysis of a subgroup investigated consumers’ views about the current system, barriers to effective treatment and suggestions for improvements. Major depression, social phobia and generalised anxiety disorder were the most commonly diagnosed mental health disorders. Alcohol and cannabis were the most commonly used substances. Almost half of the participants had more than one mental health disorder. Consumers reported concerns regarding lack of referral information, and difficulties when entering the system. Consumers also wanted services to take a more holistic view of treatment and to place greater emphasis on assisting them to maintain and develop relationships. It was concluded that both primary and secondary services needed to improve their identification of, and response to, comorbid issues in their clients to ensure they are providing clear pathways of care. Further, care of this group needed to extend beyond clinical symptoms to include wider socio-environmental issues.

Indigenous responsive healing practices in Africa and South East Asia

Chair(s): SODI, T. (Department of Psychology, University of Limpopo (Turfloop Campus), Sovenga, 0727)

Discussant(s): MPOFU, E. (Faculty of Health Sciences, University of Sydney, East Street, Lidcombe)

Calls for the recognition of indigenous healers have been growing louder as there is an increasing realization about the important role that indigenous healers can play in health promotion and community development in many parts of the developing world. Other scholars have criticized psychology and other health disciplines for being Eurocentric and unresponsive to the needs of the inhabitants of the developing world. Central to this critical voice is the view that the different psychological theories are not universal, but are embedded in a western cultural and socio-political matrix. Whilst recognizing the importance of modern psychological theories in health promotion, the presenters in this symposium are arguing for the need to consider indigenous healing as a viable and psychologically meaningful healthcare resource that can benefit the majority of people in the developing world. The main objective of the symposium is to present the results of a few studies that have investigated the psychological basis of indigenous healing in three diverse cultural contexts (namely Africa, Southeast Asia and Australia). The first paper focuses on the process of becoming an indigenous healer and identifies the important role that spirituality plays in shaping the training and practice of indigenous healers. In the second paper the presenter critically looks at the limitations of the trauma theories that have been applied in the assessment and treatment of trauma in the post-war regions of Southeast Asia (Cambodia, Laos, Burma). She proposes an assessment and therapeutic framework that accounts for spirit-based perceptions/worldviews as a way of increasing experiences of protection for individuals and whole communities in Southeast Asia. The third paper looks at culturally relevant counseling strategies to assist African humanitarian entrants to Tasmania. The presenter identifies and recommends activities like community gatherings as some of the culturally appropriate counseling pathways that can benefit this minority community in Australia. The fourth and fifth papers look at indigenous healing practices in the northern part of South Africa and generally conclude by suggesting that this is a meaningful and culturally patterned therapeutic system that needs to be developed and supported.

The process of becoming an indigenous healer: Phenomenological accounts by indigenous healers in rural South Africa

MAKATU, M. (Department of Psychology, University of Venda, Thohoyandou, 0950)

This study is part of a larger funded investigation that sought to understand and describe indigenous healing practices among the Venda, Shangaan, Northern Sotho and Ndebele communities of Limpopo Province, South Africa. In this paper, the author specifically focuses on indigenous healers’ own accounts of how and why they became traditional health practitioners. Both purposive and panel sampling procedures were used to identify and select the 12 indigenous healers who participated in this study. The indigenous healers were selected from the local chapters of the traditional healers’ organizations in Limpopo Province. In this regard, 3 indigenous healers were identified and selected from each of the four indigenous language groups found in this particular province (i.e. 3 Tshivenda speaking indigenous healers; 3 Xitsonga speaking indigenous healers; 3 Northern Sotho speaking indigenous healers; and 3 iSindebele speaking indigenous healers). Interviews were used to collect the data. For most of the participants in this study, becoming an indigenous healer is a process and experience that is associated with spirituality. In almost all the cases, the participants reported that they were “called by their ancestors” to join the healing profession. This “call” to join the indigenous healing profession is usually communicated by the ancestors in the form of...
an illness. Anyone with such illness is expected to go through a process of training in order to become an indigenous healer. The results of this study are discussed in the context of the role of culture in health, illness and healing. The study is concluded by suggesting that some conditions of ill health may be perceived as positive and growth-promoting if understood within the cultural contexts of the communities where they occur.

Keywords: indigenous, healing, illness

Influx of “Trauma” theories and practices developed in Judeo-Christian countries and their relevance to “spirit-based anxiety” in SE Asia

LEVINE, P. (Monash Asia Institute, Monash University, Melbourne)

The influx of NGOs who claim to specialise in assessment and treatment of “trauma” in post-war regions in SE Asia (Cambodia, Laos, Burma) and refugee border camps has increased over the years. This author will outline how Posttraumatic Stress Disorder (PTSD) has emerged out of a context influenced by American, Judeo-Christian, capitalistic-democratic values, yet PTSD is assumed to be universal. [PTSD was developed in the United States following research conducted on American Vietnam Veterans, and listed as a mental disorder in 1980.] By reviewing methods by which ‘evidence-based research’ is gathered, this author aims to show how symptom-based checklists on trauma are continually funded with little consideration to the cultural complexity of terms of distress, and village-based contexts. For example, most recently a USA-funded project in Cambodia highlighted ‘forgiveness’ (found evidence) as a psycho-emotional state related to trauma recovery with little consideration to Buddhist and animistic perceptions of karma, spirit possession, and indigenous village processes for reconciliation. To date, there has been little scope from which to account ‘formally’ for influences of spirit phenomena embedded in the fabric of SE Asia’s geo-culture. The author of this paper conducted a 7-year qualitative study (film ethnography) on breakdown of ritual practices during the Khmer Rouge regime era and found “spirit-based anxiety” (her term) to be relevant to Cambodian experiences of distress. She will show a sample of this film work. To date, consideration of spirit influences is regarded often as ‘culture-bound’ and attention to such influences on people’s wellbeing has been marginal in scope – while institutional religions are infiltrating mental health practices in ways that are subtle. The author will differentiate between Western notions of spirituality and SE Asian notions of spirit influences. The author will propose ways to safeguard mental health development from religious-biased research and practices in mental health. She will present a framework for assessment that accounts for spirit-based perceptions/worldviews as a way of increasing experiences of protection for individuals and whole communities

Keywords: trauma, mental disorders, reconciliation, distress, forgiveness

“Opening the Way”: Significance of traditional African healing practices reported by male African humanitarian entrants in Tasmania

HARRIS, A. (Department of Rural Health, University of Tasmania, Launceston)

This study sought to identify culturally appropriate counselling pathways for African humanitarian entrants to Tasmania. It was prompted by the recognition that Western approaches to overcoming traumatic events did not have sufficient scope to meet the needs of this client group. A phenomenological approach was taken to the material. 8 Christian and 8 Muslim participants from six African countries were interviewed about their knowledge and experience of problem solving. In addition, ethnographic observation was conducted by invitation at ten African gatherings in Tasmania. A review of literature on African culture and healing was conducted, and two consensus groups of five additional participants each from Sudan and Sierra Leone assisted in refining the findings. Community gatherings were identified by all participants as central to problem solving. Reports of indigenous healing practices were pivotal in developing a more comprehensive appreciation of the meaning of community for Africans, and in particular the potency
associated with ancestral influence, spirit beliefs, religion, and the physical environment. Most western counseling and psychological practices incorporate assumptions of individual self-hood, founded on philosophical ideas which are too restrictive for African humanitarian entrants. Dismissing African traditional beliefs as “magical thinking” is likely to be counter-therapeutic: instead, inclusive approaches to difficult problems are recommended.

Diagnosis, treatment and prevention of illness by indigenous healers in Limpopo Province, South Africa

MASHAMBA, T. (Department of Psychology, University of Venda, Thohoyandou, 0950)

In Africa and the rest of the developing world, there has been a growing realization of the importance of traditional medicine in health promotion and the treatment of various illnesses. In some developing countries like South Africa, there have been suggestions that up to 80% of the population make use of the services of indigenous healers at some point in their lives. In this paper, the results of a study that explored indigenous healing in the rural communities of Limpopo Province (South Africa) are presented. Specifically, the paper focuses on indigenous healers’ descriptions of their diagnostic, treatment and preventive approaches to various forms of illness. A qualitative approach was adopted in the present study. Following the principles of purposeful and panel sampling, 12 indigenous healers were selected and interviewed to capture their own descriptions of the diagnostic, treatment and preventive methods that they use in assisting their patients. Data was recorded through an audiotape. This data was later transcribed before it was translated and analyzed. The study found that most indigenous healers rely on divination bones and the spiritual guidance of their ancestors to diagnose the illnesses that their patients suffer from. It was also found that indigenous healers use a wide range of treatments methods to assist their patients. These, among others, include, psychological counseling, some simple “surgical methods”, rituals and some therapeutic dances. In some cases, patients are encouraged to engage in some ceremonial acts to prevent illness and to promote family stability. The paper is concluded by calling for more studies to investigate this alternative form of health care in view of its great potential in the treatment of illness and other ailments in indigenous African communities.

Tshiilo, the indigenous healer: Psychological interpretation of healing in a Venda community, Limpopo Province

TAKALANI, J. (Department of Psychology, University of Venda, Thohoyandou, 0950)

This article is based on the results of a larger study that investigated indigenous healing in Limpopo Province. Using excerpts from interviews with Tshiilo (one of the twelve indigenous healers who participated in the study), the author looks at how this particular healer understands and explains his work with clients. The specific objectives were to: a). identify the psychological elements that are associated with indigenous healing; b). provide a psychological interpretation of the healing procedures that are used in indigenous healing; and, c). identify and describe the steps followed in indigenous healing. Given the nature of the issues that this study aimed to investigate, a qualitative research method was considered appropriate. The face to face phenomenological interview technique was employed in this study. Informed consent was obtained from the indigenous healer before the interviews were conducted. All in all two interviews were conducted at the indigenous healer’s homestead. The interviews were conducted in Tshivenda and later transcribed before they were translated into English. The subjective and experiential accounts by the indigenous healer were analyzed so as to identify central themes that have psychological insights. A further analysis of these central themes suggests that indigenous healing is a logical and psychologically meaningful process that can be divided into three phases, namely: the initial phase, treatment phase and terminal phase. The paper is concluded by arguing that
traditional healing is a meaningful and culturally patterned therapeutic system that needs to be developed and legitimized as health care resource in South Africa.

**Individual and social factors in health behaviour change**

Chair(s): SCHOLZ, U. (University of Zurich)

Discussant(s): LUSZCZYNSKA, A. (University of Colorado; Warsaw School of Social Sciences and Humanities)

Health-behaviour change is a difficult endeavour. Psychological theories of health behaviour change specify self-regulatory factors that are assumed and have been proven to be important for successful behaviour change. However, even if health-behaviour change occurs on the individual level, it is something that takes place within a social context, e.g., intimate relationships, family, workplace, neighbourhood or peer groups. Most psychological theories of health-behaviour change have so far excluded social factors, although research provides evidence for the importance of these factors for individual behaviour change. This symposium brings together research from different areas of health behaviour change and emphasises the role of both individual and social factors. The importance of integrating both individual and social factors is demonstrated by research from various real-life settings. The first two contributions from Schueler and Brandstaetter and from Mullan examine the role of individual factors in interacting with the environment during health-behaviour change. The paper by Schueler and Brandstaetter addresses the topic of person-environment fit and its associations with flow experience. Flow experience is a key motivational factor for initiation and maintenance of a physically active lifestyle. The paper by Mullan focuses on an extension of the Theory of Planned Behaviour by including executive functioning and behavioral prepotency, two rather underresearched factors in health-behaviour change. The paper examines the importance of these two constructs for four different behaviours. Social factors are addressed by the papers of Schuez and colleagues and Scholz and Hornung. The paper by Schuez and colleagues examines the relative contribution of receiving social support to
medication adherence over and above specific and general beliefs about medicines in an elderly sample. The paper by Scholz and Hornung addresses the question on the added value of including social support and social control for predicting changes in diet and changes in cigarette smoking. These four papers and the integrative discussion by Aleksandra Luszczynska present innovative research in health psychology, and with the integration of both individual and social factors outlines promising future directions for research on health behaviour change.

The person - environment fit as a determinant of intrinsic motivation in sports

SCHÜLER, J. (University of Zurich)

According to motivation psychology, motivation results from an interaction between a person’s motives and adequate incentives of the environment. In the present research we hypothesized that the goodness of fit between a person’s motive (e.g., achievement motive, affiliation motive) and the incentives in sports (e.g., achievement incentives, affiliation incentives) predicts flow experience which is known to be associated with sport adherence. To be more precise, individuals with a high motive were hypothesized to benefit more in their flow experience from situations characterized by corresponding incentives compared to individuals low in the motive. But they were also expected to suffer more when corresponding incentives are lacking than low motivated individuals. Three correlational field studies and one experiment in different domains of sport were conducted to test the hypothesis. In Study 1 we were interested in flow experience in badminton players and focussed on the achievement domain. We measured participants’ achievement motives and asked for incentives in fitness sports. In Study 4 an expert rating revealed different incentive profiles of sports (e.g., fitness, combat, basketball) which were used to test the hypothesized incentive (expert rating) x motive (of participants) interaction. As expected, all four studies showed that individuals whose motives fit to the incentives of the sport situation reported more flow than individuals whose motives did not fit to the sport incentives. Participants with a high motive who did not experience corresponding incentives in their sport environment reported the lowest amount of flow. The results indicate that a person (motive) x environment (incentive) fit approach is useful to explain optimal motivation in sport. The practical implications for health promotion programs will be discussed.

Keywords: motivation, sport, flow, achievement, health promotion

Exploring the role of executive function in the performance of health behaviours

MULLAN, B. (University of Sydney)

The aim of the Theory of Planned Behaviour (TPB) is to identify factors that impact upon the performance of a particular behaviour, and consequently predict this behaviour. The application of the TPB has been largely successful in the health domain; however prediction is still far from perfect, suggesting that there are additional variables that need to be considered. Hall and Fong have proposed that behavioural prepotency (BP) and biologically imbued self-regulatory capacity, or executive function (EF), may be relevant to the performance of health behaviours. Thus, the aim of the current research is to determine whether the addition of BP and EF to the TPB will improve its predictive power. Four prospective longitudinal studies were conducted with undergraduate students, examining breakfast consumption, sleep hygiene, safe food handling behaviours, and dietary behaviours. The two facets of EF examined were planning and response inhibition, as these were considered to be most relevant to the performance of health behaviours. TPB and BP data were obtained via online questionnaires and EF data was
Abstracts of the 27th International Congress of Applied Psychology

obtained via computerised neurocognitive tasks - including the Go/No-go task, the Stroop task and the Tower of Hanoi. A week later, behaviour was assessed. Data were examined using hierarchical regression analyses. The TPB was successful at predicting all four of the behaviours. BP improved the prediction of all behaviours. Measures of EF were found to predict additional variance in both breakfast consumption and sleep hygiene. However, EF did not predict any additional variance in either safe food handling or dietary behaviours. These studies suggest that, while certain facets of EF may not be relevant in some health domains, there does appear to be some connection between EF and the performance of health behaviours. However, the inconsistency of the results suggests that this relationship is stronger in certain behaviours than in others. All behaviours were similar in that they were habitual, suggesting other factors need to be explored, for example behaviours that reward immediately versus distally. A further direction for future research would be to look at different facets of EF and the relationship between BP and EF.

Keywords: theory of planned behaviour, behavioural prepotency, executive function, health behaviours

Beyond beliefs: Social and cognitive factors affect medication adherence in elderly individuals with multiple illnesses

SCHÜZ, B. (German Centre of Gerontology)

To determine predictors of adherence to medication in elderly people suffering from multiple illnesses. As they grow older, most people suffer from an increasing number of illnesses. This results in complex patterns of multiple illnesses often requiring complex treatments. A central part of effective treatment is individual adherence to prescribed medication. However, this is complicated by the fact that older people often have to take multiple medications with complex regimens, which makes suboptimal adherence more likely. Research according to the common sense model of health and illness suggests that individual specific and general beliefs about medicines are important predictors of adherence behaviour. We extend this view by integrating social support into the prediction of adherence and - for the first time - examine these cognitive and social factors in a sample of elderly people with multiple illnesses. Longitudinal interview- and questionnaire-based survey with a 6-months interval in \( n = 309 \) individuals aged 65+ suffering from 2 or more diseases. Self-reports for medication adherence (Reported Adherence to Medication Scale), general and specific beliefs about medicines (Beliefs about Medicines Questionnaire), received social support for medication adherence, number of medicines and health status. Logistic regression analysis was used to determine social and cognitive predictors of optimal or suboptimal medication adherence. After controlling for baseline adherence (OR=2.89), general beliefs about medicines (OR=1.52) and received social support (OR=1.62) emerged significant predictors for medication adherence 6 months later. The total number of medicines did not predict adherence, neither in main nor interaction terms. Partial support was found for the model of medication adherence implied by the common sense model: General beliefs about medicines are more important in predicting the medication adherence of older adults with multiple illnesses than specific beliefs. This might be due to the fact that individuals suffered from multiple diseases with potentially interacting beliefs about medication efficacy. Individuals with good social support were more adherent to medication, which underlines the importance of supportive networks for individuals with multiple illnesses. General beliefs about medication however remain a challenge for interventions, as broad expectations are more difficult to change than specific cognitions.

Keywords: adherence to medication, elderly people, common sense model of health, social support

Combining social exchange processes and individual self-regulation: Impact on intention formation and health-behavior change

SCHOLZ, U. (University of Zurich)

In traditional models of health behavior change, social exchange processes, such as
social support and social control are rather neglected. At the same time, there is a growing body of research on social exchange processes and health-behavior change that, in turn, rather ignores the individual factors assumed important in health behavior change theories. A combination of both lines of research seems beneficial in order to examine whether social exchange processes add to the explanation of intention formation and behavior change over and above established individual self-regulatory variables. These two studies aimed at investigating whether behaviour-specific received social support and social control were able to predict change in behavioural intentions and change in behaviour in competition to well-established predictors as specified in the Health Action Process Approach (HAPA). In Study 1, 163 participants ($n = 81$ women, 49.7%; mean age = 31.3, $SD = 9.98$) completed two online-questionnaires on smoking-specific HAPA-variables and smoking-specific social support and social control within a 4-weeks interval. In Study 2, 270 overweight and obese adults (72.1% women, mean age = 53.7, $SD = 12.59$) completed questionnaires at baseline and 12 months later on nutrition-specific HAPA-variables and nutrition-specific received social support. In Study 1, social exchange processes were not related to intention formation over and above individual factors. However, for change in smoking behavior a significant positive association occurred with social control. No association emerged with social support. In Study 2, social support added to change in intentions as well as to change in diet across the 12-months period over and above individual self-regulation. Overall, social exchange processes seem to play an important role for intention formation and behavior change over and above individual self-regulation. In case of social control for smoking cessation, however, the positive association with behavior indicated potential detrimental effects of social control. Moreover, the two studies, suggest differences in effectiveness of social support and social control for different behaviors.

### Interational leadership

Chair(s): SCHYNS, B. (University of Portsmouth)

Discussant(s): DEN HARTOG, D. (University of Amsterdam)

Leadership emerges through social interaction. Research and leadership practice increasingly acknowledge that leaders and followers interact to construct the process called leadership. It is not only individual followers but also groups as a whole that influence the emergent leadership process. The interaction between leaders and followers and the interaction within a group are keys to successful leadership. In this symposium, the contributions focus on illuminating the process of leadership in the context of dyadic and group interaction. The aim is to enhance our understanding of interactional leadership from different perspectives. Presentation One focuses on the effects of group participation in goal setting. Their work extends goal setting research to a group level. The key question is whether or not leaders can enhance their group’s performance by giving them a choice to participate in setting their own goals. The authors show that this is indeed a promising path for future research. Presentation Two outlines the importance of examining leader-member relationships in a broader context. Prior research has focused mainly on the (isolated) follower’s perspective. The authors’ review of the literature revealed that leader and follower agreement regarding their relationship as well as within group consensus regarding Leader-Member Exchange (LMX) relationship is vital for leadership success. Presentation Three investigates the process through which charismatic leadership influences different types of outcomes. They posit that charismatic leadership interacts with followers’ personal and relational self-concepts when predicting outcomes on different levels, indicating the importance of both leaders’ behaviour and follower characteristics in successful leadership. Finally, Presentation Four investigates the role of group consensus regarding transformational leadership in follower stress. They argue that consensus in transformational leadership serves as a resource for that reduces followers’ stress;
however, they find this effect only for their female participants. Thus, group processes maybe of differential importance for male and female followers. In conclusion, this symposium highlights the importance of leadership as an interactional process. Leadership needs to be examined taking into account leader-follower as well as intra- and inter-group processes.

The benefits of participative group goal setting become apparent as tasks become increasingly challenging over time

WEGGE, J. (Technical University of Dresden)

A large body of research has pointed to the utility of individual and group goal setting as a performance enhancement strategy. However, group goal setting is more complex than individual goal setting as the group context often strengthens the desire for voice and the possibility of resistance. In line with this idea, we test the prediction that goal-related performance improvements should be more marked where groups participate in goal setting rather than having goals imposed — particularly as they become increasingly hard to achieve. Two experiments were conducted ($N_{groups} = 27, 72$). In both studies small groups of three or four students took part in brainstorming exercises in three phases. In Phase One, groups were instructed to identify as many uses as possible for a common object in five minutes. This established a “do your best” baseline against which performance in subsequent phases can be compared. In subsequent phases groups were randomly assigned to one of three (Study One) or five (Study Two) independent conditions. One of these was a control condition, in which groups were asked in each phase to continue to “do your best”. In other conditions the groups in Phases 2 and 3 were invited to set a performance improvement goal (+20% vs. +40% or +40% vs. +80%) either set by the experimenter or by themselves with reference to a goal suggested by the experimenter. The results of both experiments confirm the capacity for group goal setting to enhance brainstorming performance. More importantly, both studies also show that the benefits of participative goal setting become more marked as goals become more difficult over time. In line with social identity and self-categorization principles, we suggest that this is because increases in participative set goals appear to provide opportunities for collective self-actualization and self-enhancement while increases in imposed goals do not. The present studies lead the conclusion that if groups are to be encouraged to take on and accomplish goals that become increasingly difficult over time, there is much to be gained from the process of enjoining their members in the process of setting goals.

Keywords: goal setting, performance, goal setting, brainstorming

Agreement, consensus, and excellence in Leader-Member Exchange

DAY, D. (University of Western Australia)

The relationship quality that develops between leaders and their followers has interested researchers and practitioners ever since the introduction of the Leader-Member Exchange (LMX) approach in the 1970s. A primary reason for this continuing interest is that research has shown that high quality LMX relationships are positively related to desired organisational outcomes such as individual commitment, job satisfaction and performance. While originally conceptualised as a dyadic construct, the group context in which relationships develop has not received the same level of theoretical or empirical attention. We will provide an overview of the more recent developments in the field of leader-member exchange (LMX) theory including the emergent focus on the broader context in which dyadic exchanges develop. This is a theoretical paper. An overview of prior literature and research is provided, mainly concentrating on recent research into the question how leader-member agreement and follower consensus regarding LMX relationships develop and what consequences they have. This will be used to derive propositions for future research. Having reviewed the literature, it becomes clear that there is an optimal LMX combination, that is, high-quality LMX, high leader-member agreement as well as high group consensus in LMX quality. We introduce this as LMX excellence. While recent research and theory supports this notion, in organisational
contexts, LMX excellence might be difficult to achieve. We identified several factors that can enhance or hinder the development of LMX excellence. Examples include role clarification, climate and social identity. From our analysis of the literature, we conclude that taking into account not only one side (i.e., follower or leader) but both sides of the exchange relationship as well as the group context in which relationships develop is vital to establishing and maintaining the positive effects connected with LMX relationships. We recommend for leaders and organisations as well as researchers to take a 360 degree look at LMX, including intra-group relationships.

Keywords: Leader-Member Exchange (LMX), job satisfaction, performance, leadership, leader-member agreement

Interactive effects of charismatic leadership and follower identity orientations

KERSCHREITER, R. (Ludwig-Maximilian University)

Charismatic leadership theory posits that charismatic leaders enhance followers’ motivation and performance. The identity orientations framework holds that the way people define themselves as being more individuated (personal self-concept) or more interpersonal oriented (relational self-concept) influences how they interact with others. Therefore, the impact a charismatic leader has on a follower should also depend to a certain extent on the follower’s activated self-concept. In line with this idea, the present studies test the prediction that a follower’s self-concept and leader charisma interact. Furthermore, we expect different effects for personal and relational outcome variables depending on follower self-concept (personal vs. relational). With regard to more personal outcomes (satisfaction, turnover intentions) we predict the relationship between leader charisma and these outcomes to be stronger, the more followers define themselves as being individuated (personal self-concept). With regard to more relational outcomes (performance) we predicted the relation between leader charisma and performance to be stronger, the more followers define themselves as being member of a role relationship (relational self-concept). Two employee surveys ($N_1 = 234$ and $N_2 = 135$) were conducted in two regional German credit institutions. We measured charismatic leadership, employee self-concept, satisfaction, and turnover intentions using a questionnaire format. Employee performance was rated by the employee’s direct supervisor. As predicted, the relationship between leader charisma and personal outcomes (satisfaction, turnover intentions) turned out to be stronger the more followers defined themselves as being individuated (personal self-concept). In contrast, the relationship between leader charisma and performance turned out to be stronger the more followers defined themselves as being member of a role relationship (relational self-concept). Combining insights from charismatic leadership theory and the identity orientations framework, the present studies showed that the attribution of a charismatic leadership style and a person’s identity orientation interact in predicting performance, turnover intentions and satisfaction. This indicates the importance of both leaders’ behaviour and follower characteristics in successful leadership.

Keywords: charismatic leadership, motivation, performance, self-concept, leadership

Occupational resources and strain: Moderator effects of gender and consensus of transformational leadership

FELFE, J. (University of Siegen)

If we agree I feel better!” Can shared perceptions of the supervisor of the team mitigate perceived stress? The aim of the study is to examine the meaning of consensus with regard to leadership perceptions for employees’ health. Based on a follower-centred approach to transformational leadership, the meaning of team consensus for employees’ well-being is analyzed. It is argued that transformational leadership also resides on the group level and thereby adds information about the consistency of leadership behaviours. It is hypothesised that consensus concerning leadership moderates the relation between resources and perceived strain. Furthermore, we expect gender to moderate the resource-strain relationships.
Data was collected from 347 employees from 30 groups in a public administrative organisation. For data analysis a multilevel approach was employed. As expected the results show that resources are negatively related to overload and irritability as negative health indicators. Contrary to our expectations consensus does not moderate the relationship of resources and strain. However, according to our hypothesis gender was found to moderate postulated relationships. The moderating effect of consensus on the resource-strain relationship is stronger for women. Consensus enhances the impact of resources for women, but not for men. The results are of theoretical and practical relevance. From a theoretical perspective our findings provide deeper insight into the functioning of consensus. Obviously women benefit more than men when consensus is high and suffer more when consensus is low. Thus consensus can be considered as a gender specific resource. For the design and implementation of occupational health programs we recommend to put more emphasis on consensus if there are a considerable high number of women and not to expect too much from consensus in groups or organizations with low number of women.

Keywords: transformational leadership, gender, consensus, leadership, teams

International perspectives on social justice in vocational psychology: Theory, research, and practice

Chair(s): DIEMER, M. (Michigan State University)

Discussant(s): MCILVEEN, P. (University of Southern Queensland)

Social justice-oriented vocational psychologists struggle to translate their moral concern with and conceptual understanding of injustice into scholarship and practice that address these inequities and shape a more just world. These are shared concerns internationally, although the nature and shape of social injustice may differ by nation. To redress the gap between social justice rhetoric and research/practice, this symposium examines conceptual, scholarly, and practice social justice issues that span four nations. Five complementary presentations consider social justice issues shared and unique to each nation, drawing on insights from each to enhance the generalizability and impact of the proposed symposium across disparate contexts. The first two presentations consider how Canadian and Australian practitioners (respectively) conceptualize socially just vocational practice, the barriers they face in implementing social justice in practice, and pedagogical/training issues in preparing the next wave of social justice-oriented practitioners. The third presentation critiques vocational guidance practice in South Africa while explicating how more socially just practices are emerging to better meet the needs of historically marginalized people. The fourth presentation discusses research examining how a consciousness of and motivation to change social inequities, critical consciousness, engenders marginalized youths’ career development in the U.S. The fifth presentation details the implementation of socially justice career interventions in rural Australia, in order to redress geographic disparities in career aspirations and postsecondary education. The learning objectives of this symposium include:
(1) Understanding “local” and “global” social justice issues in vocational psychology, (2) Learning the barriers to implementation practitioners voice, and strategies practitioners may use to translate their concern for social justice into practice, and (3) Learn how vocational psychology research and practice may better serve marginalized people by considering their consciousness of social inequalities and reconfiguring traditional career guidance services. These complementary presentations highlight themes across disparate contexts while honoring the local concerns and culture of each nation. The discussant has international vocational psychology expertise and will further the cross-fertilization of these ideas across disparate contexts. In sum, this symposium aims to facilitate a greater concern for and implementation of social justice into vocational psychologists’ theory, scholarship, and practice across the globe.

Social justice: A great concept but hard to practice

ARTHUR, N. (University of Calgary), MCMAHON, M. (University of Queensland), COLLINS, S. (Athabasca University)

The call for social justice has recently gained momentum in the career development literature; however, there is a lack of clarity about the implications for career development practice. This presentation highlights findings from research with Canadian career development practitioners, including the ways practitioners define and integrate social justice into their work, as well as the barriers that they face. Implications for practice and for career development education will be discussed. An on-line survey was developed based on items conceptually derived from available literature and revised following expert review. Open-ended questions, based on the Critical Incident Technique invited career development practitioners to provide samples of their best practices with social justice interventions and samples of barriers to such practices. Results showed the multiple meanings of social justice and what populations are defined as having social justice needs. Career development practitioners reported that their awareness of social justice were much stronger than their knowledge or skills for interventions to address social justice. Analysis of intervention approaches show that most continued to work directly with individual clients, despite the recognition of systemic influences on client issues. Barriers to enacting social justice interventions were apparent in the organizational context where practitioners work, due to lack of training, and concerns about trying to address structural and social change. The results from this study suggest that although career practitioners value social justice and see many inequities in educational, employment, and other social resources that impact their clients, many struggle with how to implement interventions to address social justice. The call for social justice as a guiding value in career development practices must be matched with curriculum that prepares practitioners with related competencies for working directly with clients, on behalf of clients, for organizational change, and to address change in broader social structures. In turn, the findings suggest that the need for guidelines and standards of practice to articulate stronger linkage between social justice and career development practices.

Keywords: social justice, career development, employment, transition, critical incident technique

Social justice: Perceived competencies of Australian career development practitioners

MCMAHON, M. (University of Queensland)

Social justice has been a guiding principle of career development throughout its history. The aim of this research study is to identify the ways that Australian career development practitioners conceptualize and implement social justice. Participants were Australian career development practitioners. Data were gathered by means of an online survey, structured in three parts. This paper focuses on data collected from two parts of the survey. First, information was sought on participants’ attitudes, skills and knowledge related to social justice competencies through a series of multiple choice items on two separate scales, importance to career practice and current competency level. Second, an optional part of the survey gathered information on critical
incident scenarios related to social justice practices. Thematic analysis was used to analyze the critical incident scenarios and competencies demonstrated by practitioners in the critical incidents were identified. Demonstrated competencies of individual participants’ were considered in relation to their perceptions of the importance of and their competency levels in a range of social justice skills, knowledge and attitudes. The results provide insight into participants’ perceptions and practices of social justice. Evidence of commitment to socially just practice by Australian career development practitioners is attested to in the results. The results also illustrate how social justice competencies perceived to be important are demonstrated. Most social justice interventions tended to be at the individual level and few were at a systemic level. The study suggests that further training may be beneficial in developing social justice competencies.

Keywords: social justice, career development, critical incident scenarios, training, social justice competencies

Social justice and social transformation in South African career psychology: Rhetoric and action

WATSON, M. (Nelson Mandela Metropolitan University)

This presentation describes the role of social justice and social transformation in career theory, research and practice in South Africa and the extent to which these issues have been addressed and redressed in both South African literature and practice. Recent international literature cautions that reflection without action and action without reflection will not advance social justice and transformation agendas in career psychology. With this in mind, the presentation explores the gap between the ideology of social justice and transformation agendas and the realities of the contexts in which the majority of South Africans attempt to work or to develop a career. The impact of the historical context of apartheid has been well documented, yet the persistence of dysfunctional educational and governmental systems has been less so. This had led to the perpetuation of inequality with only a small burgeoning middle class black population seeming to benefit from social transformation agendas. The scale of existing social injustices and the lack of sufficient social transformation is evident in two 2009 South African surveys. One survey cites the fact that just under half a million children have never attended school or have dropped out. The second survey concludes that South African career guidance is a marginalized national priority, lacks coordination and leadership, and is a largely devolved, dispersed, adhoc set of activities. The lack of a sustained emphasis on social justice and transformation issues in South African career psychology is considered within the context of international recognition that powerful and affluent individuals and organizations are essential if these issues are to translate from rhetoric to action. The presentation considers recent initiatives to transform the role of career guidance in South Africa by creating a more socially just, transformative and accessible service, as well as international calls for collaborative theory building, research and practice in career psychology. Given the extensive scale of historical and contemporary social justice and transformation issues in South Africa, as well as the limited infrastructure and personnel resources to address/redress these issues, the presentation considers the challenge of what to do with qualitative concepts and issues within quantitative contextual realities.

Keywords: social justice, social transformation, career psychology, career guidance, South Africa

Critical consciousness & career development among North American marginalized youth

DIEMER, M. (Michigan State University)

In North America, structural barriers constrain marginalized youths’ occupational self-concept – comprised of work salience and vocational expectations. Critical consciousness (CC), the consciousness of and motivation to reduce sociopolitical inequality, may facilitate the negotiation of these structural constraints. CC may assist youth in situating their individual effort within an inequitable opportunity structure, or how to “play the games of school
and work on an uneven playing field." This paper extends previous CC/career development scholarship (Chronister & McWhirter, 2006; Diemer & Blustein, 2006; O’Connor, 1997) by (a) examining these relationships by racial/ethnic group (b) exploring measurement invariance across groups and over time (c) and testing model sensitivity with more privileged youth. Structural equation modeling examined CC’s direct and longitudinal impact on work salience and vocational expectations among samples of low-SES African American, Latino/a and Asian American youth, while controlling for academic achievement. Measurement and temporal invariance of these constructs was established before testing the proposed structural model. The participants of this study were 2,627 10th and 12th graders from a North American large scale survey. CC, work salience and vocational expectations were found to be invariant across these three racial/ethnic groups and over time, providing construct validity evidence. Across the three samples, 10th grade CC had significant direct effects on 10th grade work salience and vocational expectations; 12th grade CC had a significant effect direct on 12th grade work salience. 10th grade CC had significant longitudinal effects on 12th grade work salience and on 12th grade vocational expectations. The structural model did not fit well for more privileged samples (affluent Whites, low-SES Whites, affluent youth of color) in the sensitivity analyses, suggesting that CC’s effects on career development are more salient for marginalized youth. These findings suggest that SPD facilitates the agentic negotiation of constraints on the development of work salience and vocational expectations. Rather than avoiding structural inequity for fear of “discouraging” marginalized youth, career counseling, interventions, and guidance may be augmented by greater attention to structural constraints and facilitating youths’ CC. Given the relation of adolescent career development to adult occupational attainment, CC may be a “socially-just” means of facilitating social mobility.

Keywords: critical consciousness, career development, work salience, vocational expectations, career counselling

Using Career Development Learning to Raise Career Aspirations in Rural School Children

MCILVEEN, P. (University of Southern Queensland)

Entry and transition into higher education in Australia is ostensibly equitable, yet there are evident disparities in the levels of access by high school students from rural and isolated communities. Raising rural students’ aspirations for higher education and careers which extend from university qualifications, as an objective of redressing this imbalance, has received some attention in government policy and educational practices. However, rural high school students’ access to career development learning programs delivered by appropriately trained practitioners is extremely limited. This paper addresses a program of career development learning provided by an Australian university, which has aimed to enhance rural students’ career aspirations to include higher education. A longitudinal study of participants’ experiences of an intensive career development learning intervention is reported. Approximately 18-months after the intervention, a sample of participants were interviewed to explore their experiences of the intervention and its impact upon their vocational planning. Interview transcripts were analysed using an adaptation of the qualitative research method interpretative phenomenological analysis (Smith & Osborn, 2003). Participants’ recollections of the intervention 18-months later indicated that they were influenced by the delivery of career information; the intervention facilitated their elaboration of career-related thinking and planning; the intervention provided an important source of social and emotional connection with one another; and participants demonstrated links between their career aspirations and working in rural Australia. This longitudinal study provides additional evidence that intensive career development learning interventions for rural school students may be beneficial for correcting the differential access and participation rates for this demographic group in the Australian higher education system.
International trends in preparing clinical child and adolescent psychologists

Chair(s): ROBERTS, M. (University of Kansas)

This symposium is intended to bring together different perspectives on developments in the training of the clinical child and adolescent psychology specialty field. This area of applied psychology has been growing worldwide in recognition of the immense unmet needs for improving the mental health of children and adolescents. Specialty training at different levels of application draws on evidence-based practice incorporating information from empirically-based assessment and treatment, clinician expertise, and client values. Different approaches are taken accommodating different countries’ educational structures and systems for mental health services. This symposium is intended to elucidate new developments and outline the future for specialty applications of clinical child and pediatric psychology worldwide. Presenters will discuss issues of licensure and credentialing faced in the United States, development of psychopharmacology training within psychology, applications and training in evidence-based practice in different countries and cultures, scientist-practitioner training in pediatric (child health) psychology, and Latin American developments for training professionals in applied child psychology. Key Learning Objectives include: describe the international efforts for the training and applied practice in the specialty of clinical child and adolescent psychology; discuss significant issues facing different countries in developing specialty applications to meet the psychological needs of children and adolescents; and prepare for developments in research and applications in the specialty of clinical child and adolescent psychology.

Training for licensing and credentialing in clinical child and adolescent psychology in the United States
ANTON, B. (American Psychological Association)

This presentation will address challenges to licensing and credentialing for the professional preparation of delivery of clinical services by professionals in the specialty of clinical child and adolescent psychology in the United States. Children are seriously underserved in the United States and the scientific knowledge base is evolving. However, there are significant barriers to practice that include licensing challenges and specialty credentialing for early career psychologists. This presentation will analyze the mental health needs of children and adolescents as well as the present state of licensing and credentialing. Implications for international professionals will be discussed.

Keywords: licensing, credentialing, child and adolescent psychology, United States

Scientist-practitioner training in clinical child and pediatric psychology: International developments

LA GRECA, A. (University of Miami)

This paper will discuss professional preparation for delivery of evidence-based services by scientist-practitioner professionals in the specialty of pediatric psychology in the United States and other countries. Children are seriously underserved and the scientific knowledge base is developing to meet the needs affecting training. This presentation will analyze mental health needs of children and families as well as the present state of training and education with specificity the child health and pediatric psychology. Advances in the scientific literature and rising needs for qualified professionals in the United States require attention to sequences of predoctoral, internship and postdoctoral training. Implications for international professionalism will be discussed.

Keywords: scientist-practitioner, pediatric psychology, United States, education, training

Latin American perspectives on professional training for clinical child and adolescent psychologists

SANCHEZ-SOSA, J.J. (National University of Mexico)

Although Clinical Psychology in Mexico is a well defined and established field, training of clinical psychologists to work in the specific area of children and adolescents still receives input from a variety of professionals. As in other Latin American countries, this specialized clinical work is benefitting from the promotion of research-based practice. Educating all the way from politicians to the public in general on these and other issues is therefore a current priority of Mexican psychologists.

Keywords: clinical psychology, Mexico, training, children, adolescents

Clinical psychology training and evidence based practice in Ireland

O’REILLY, G. (University College Dublin)

An over-view of clinical psychology training in Ireland will be presented, emphasising the role of integrating knowledge of theory and research in child clinical practice. In addition the blending of conducting clinically relevant research as a core part of clinical training will be illustrated.

Keywords: clinical psychology, training, Ireland

Psychopharmacology applications in clinical child and adolescent psychology and training

BROWN, R. (Temple University Health Sciences Center)

This presentation will provide the latest updates on pediatric psychopharmacology for childhood mental health disorders including the most recent research on the safety and efficacy of many of the commonly used medications. In particular, information will be provided on the use of multimodal therapies including the combination of psychotropic medication and psychotherapy for the management of both the internalizing and externalizing mental health disorders in children and adolescents.
Internationalizing ethics in psychology

Chair(s): GAUTHIER, J. (Laval University)
Discussant(s): ALLAN, A. (Edith Cowan University)

Today, psychologists increasingly work cross-culturally either within their own country or by working in other countries. It takes a conscious effort to understand the implications for psychological practice of the cultural differences that exist. The purpose of this symposium is to discuss the internationalization of ethics in psychology and highlight new developments in the field. The symposium includes four papers presented by four distinguished participants. The first paper focuses on psychological ethics from an international perspective and ways to incorporate a broader ethics perspective into the ethics training curriculum. The second paper provides an overview of formally adopted regional and international ethics documents intended to be applied across national boundaries, and discuss their meaning in terms of the evolution of ethics in psychology. The third paper demonstrates a process for psychologists to consider when using the Universal Declaration of Ethical Principles for Psychologists as a guide to creating or reviewing a code of ethics. The fourth paper demonstrates how the Universal Declaration can be used as a resource in ethical decision-making. The symposium also includes concluding remarks from an international perspective by a discussant who is a world-renowned expert in ethics. There will be opportunity for audience members to ask questions of presenters and for an exchange of views.

Internationalizing the ethics training curriculum in North America and beyond

LEACH, M. (University of Louisville)

Ethics training in North American psychology has almost exclusively focused on the APA and CPA codes of ethics, with virtually no mention of other ethical systems, codes, types, and
developments. This presentation will focus on psychological ethics from an international perspective and ways to incorporate a broader ethics perspective into the training curriculum. Recent ethics developments internationally will be presented along with results of ethics codes comparison studies that can be included in research, testing and assessment, and applied coursework. Implications for teaching ethics outside of North America will be included, along with implications for the psychology field itself.

Keywords: ethics, codes of ethics, training, ethics

The evolution of codes of ethics for psychologists: Going international

GAUTHIER, J. (Laval University)

Many ethics codes for psychologists have been developed by national psychology organizations. However, psychologists live in a globalizing world where traditional boundaries are fading and, therefore, they increasingly work with persons from diverse cultural backgrounds within their own country or in other countries. It takes a conscious effort to understand the implications for psychology of the cultural differences that exist, especially since most of us have not been nurtured or socialized in the multicultural aspects of today’s changing world. This presentation will focus on ethics documents intended to be applied across national boundaries and discuss their meaning in terms of the evolution of ethics in psychology. Ethics documents intended to be applied across national boundaries have been developed and formally adopted by regional (i.e., groups of countries) and international psychological associations. An overview of these documents and the historical context in which they were developed will demonstrate that ethics documents have evolved considerably since the publication of the first code of ethics in psychology in 1953. One major development is that ethics documents in psychology are becoming international. The Universal Declaration of Ethical Principles for Psychologists (2008) represents the latest expression of this movement and the largest international effort of psychologists to establish an explicit moral framework of ethical principles that are based on shared human values across cultures. Another major development in ethics documents is the articulation of a moral ethical framework or philosophical foundation that is not only aspirational, but is clearly demonstrated in all value and standards statement that may follow. Language has changed and definitions and themes have also evolved. Ethics documents tend to reflect concerns of the day and evolve according to changing world conditions. Standards of behaviour have been a major concern in psychology. Over time, ethics codes have included explicit statements of overarching or underlying philosophical moral ethical principles.

Keywords: ethics, diverse cultural backgrounds, cultural diversity, multicultural, Universal Declaration of Ethical Principles for Psychologists

Guidelines for using the Universal Declaration of Ethical Principles for Psychologists to create a code of ethics

PETTIFOR, J. L. (University of Calgary)

The Universal Declaration of Ethical Principles for Psychologists provides a moral foundation for professional codes of ethics. This presentation demonstrates a process for psychologists to consider when using the Universal Declaration as a guide to creating or reviewing a code of ethics. A careful review of the objectives for having a code of ethics provides direction. Reviewing each of the ethical principles through a cultural lens clarifies the meaning. Wide consultation promotes acceptance. Against this background, psychologists can develop culture-specific standards of behaviour. This process translates universal principles into practical culture-specific standards that honour the differences in the interpretation of culture.

Keywords: Universal Declaration of Ethical Principles for Psychologists, codes of ethics, ethics, culture-specific, ethical practice

Using the Universal Declaration of Ethical Principles for Psychologists in ethical decision making
SINCLAIR, C. (The Hincks-Dellcrest Treatment Centre)

Regardless of world location, ethnicity, or type of psychological activity, psychologists are faced daily with ethical questions and dilemmas. This presentation will demonstrate how the *Universal Declaration of Ethical Principles for Psychologists* can be used as a resource in ethical decision making. Vignettes that describe situations requiring difficult choices will be presented. This will be followed by a demonstration of how the principles, values, and basic messages of the *Declaration* could be used to explore the ethical issues in the vignettes, and guide psychologists in their decision making. Reference will be made to different models of ethical decision making, the cultural variability of such models, and the Universal Declaration’s position in the model spectrum.

**Keywords:** *Universal Declaration of Ethical Principles for Psychologists*, ethical decision making, ethical issues, cultural variability, ethical practice

---

**Issues confronting culturally diverse young people and their families: Implications for intervention**

Chair(s): XENOS, S. (RMIT University)

In keeping with the theme of the 27th International Congress of Applied Psychology “encompassing global applied psychology”, the main focus of this symposium is on the challenges confronting young people of diverse cultural backgrounds and their families and the implications for psychologists in assisting young people confront these challenges. The first paper is presented by Professor Jim Georgas of The National and Kapodistrian University of Athens and examines family values and relationships in Greek families, both in Greece and internationally. The second paper is presented by Sophia Xenos and Carina Coulacoglou from RMIT University and the University of Athens and examines the fairy tale test, a projective personality test for children, with a sample of children in Greece and Australia and explores cross cultural similarities and differences across the two samples. The third paper is presented by Catherine Hughes from RMIT University. Catherine’s paper examines self-concept, career maturity, and parenting style with a sample of students in Australia and Thailand, and draws of implications for practitioners working in a cross cultural setting.

**The Greek family: Past, present and future**

GEORGAS, J. (The National and Kapodistrian University of Athens)

We have considerable knowledge about past families in Greece from historians, philologists, social and behavioral scientists. We know about the relationships between grandparents, parents, children, uncles and aunts, cousins, koumbari and others. We know about the family values, the roles of the men and the
women, the parents and the children, the bonds with relatives and other members of the village. We know about the relationships of the families in the Greek villages, the role of religion and the clergy, the role of the teacher. At the present time, the economic development of Greece during the past 50 years, and particularly since 1980, a number of changes have occurred in the family. Some describe these changes as the crisis of the Greek family, the abandonment of traditional family values, the lack of respect of young people for their elders, the isolation of the nuclear family from their relatives. But recent studies suggest that the family is adapting to the social and economic developments, in which new opportunities for education have played a major role. This paper will describe recent studies from the University of Athens and other research centers about the current family in Greece. These studies have looked at a number of variables related to families. Family networks describe the relationships and communication between family members and relatives. The family values are those traditional values where the father has all the authority in the family, and those values regarding psychological relationships within the family. Three types of family roles of mothers and fathers are emotional support, financial roles, and care of children. How close are the emotional bonds with members of the nuclear family (mother, father and children) and with members of the extended family (grandparents, aunts and uncles, cousins). How much has the Greek family changed? These changes will be described. We will also compare these changes to those occurring in countries throughout the world. The changes in family in Greece are also directly relevant to the Greek families in Australia and other countries to which Greeks have emigrated during the past 100 years.

Keywords: Greece, relationships, family

The challenges of implementing a schoolwide behavioural resiliency-building intervention with children of refugee and recently arrived migrant backgrounds

ICHLOV, S. (Travancore School, Debney Meadows Primary School, & Carlton Primary School), XENOS, S. (RMIT University)

This project will evaluate the efficacy of the School-Wide Positive Behaviour Support for Engagement and Learning (SWPBS-EL) approach within two inner-Melbourne culturally diverse primary schools, the majority of students who are from refugee or recently-arrived migrant families. SWPBS-EL is a school-wide intervention aimed at improving a school’s ability to teach and support positive behaviour for all students. This enables students to achieve important social, emotional, and learning goals, all of which are commonly reported challenges for this particular student cohort. Using a controlled experimental design, the project will compare the academic, behavioural, social, and emotional wellbeing of primary school students across years 1 to 6 before, during, and after their involvement in the intervention across one academic year. It is anticipated that positive outcomes elicited through the project evaluation process will lead to a best practice model of positive behaviour support that can be accessed by other schools. The research model will encompass increased knowledge of the issues and potential challenges experienced by students who are from recently-arrived, refugee, and culturally diverse backgrounds.

Keywords: refugees, migrant families, schools, students, culturally and linguistically diverse backgrounds

Adapting Australian instruments for psychological research in Thailand

HUGHES, C. (RMIT University), THOMAS, T. (RMIT University), XENOS, S. (RMIT University), REECE, J. (RMIT University)

This study investigates the validity and cross-cultural equivalence of the Career Development Inventory-Australia (CDI), the Self-Description Questionnaire II (SDQII), and the Parental Bonding Instrument (PBI) for comparison of career maturity, self-concept and parenting style across Australian and Thai cultural contexts. Adopting a universalist theoretical orientation, this study applies Berry’s (1969; 1989) model to operationalise emics (culture-specific) and etics (culture-general) in cross-cultural research. The CDI, SDQII, and PBI were transported into a Thai
cultural context as imposed etics. Emic aspects of the three instruments were investigated by: (1) scrutinizing the instruments for suitability for Thailand; (2) forward and back translation; (3) translation field testing; and (4) a quantitative cross-sectional study involving 159 secondary students in Thailand and 218 students in Australia. Participants were administered the CDI, SDQII, and the PBI in their native languages. The reliability, construct validity, and cross-cultural equivalence of each instrument were then assessed to arrive at a derived etic for valid cross-cultural comparisons. Derived etic status was achieved for the Career Planning scale of the CDI, the Care and Overprotection scales of the Mother From and Father Form of the PBI, and five SDQII scales, including Mathematics, Verbal, Opposite Sex Relations, Same Sex Relations, and Parent Relations. Only these scales of the original instruments are suitable for valid cross-cultural comparison across Australian and Thai cultural contexts. For researchers, this study is an illustration of Berry’s (1969; 1989) process for operationalising etics and emics in cross-cultural research to achieve a derived etic. It also highlights the complexities of establishing the equivalence of instruments for use in cross-cultural investigations. For the users of psychological research, the results of this study underscore the need to be critical of the suitability of psychological instruments in multicultural and cross-cultural contexts.

Keywords: cross-cultural, Career Development Inventory, Self-Description Questionnaire II, Parental Bonding Instrument, Thailand

Factors related to psychopathology in the Greek-Cypriot refugee population

THOMAS, T. (RMIT University), COSTA, A. (RMIT University)

Amongst the refugee groups living in Australia, there is very little mention of the Greek-Cypriot population. However, research clearly documents the increased susceptibility of refugees to mental illness. This study aims to identify factors that are related to psychopathology in the Greek-Cypriot refugee population of Victoria. The selected psychological variables are based on Hobfoll’s Conservation of Resources theory and past research with different refugee groups. A total of 53 Greek-Cypriot refugees, including 30 females and 23 males, completed a questionnaire measuring depression, anxiety and insomnia, stress, and general mental health. The results indicate that greater resource loss, lower levels of perceived social support, loss of loved ones through war-related death, the coping style of avoidance, and past experience of physical and emotional trauma impact negatively upon current mental health. Finally, suggestions for future research and the development of appropriate policies and services to serve refugee populations are discussed.

Keywords: Greek-Cypriot refugee population, refugees, coping styles
Keep on running: Benefits of music for exercise and sport

Chair(s): TERRY, P. C. (University of Southern Queensland)
Discussant(s): MORRIS, T. (Victoria University)

Music is frequently used as an accompaniment to exercise and by athletes as part of their preparation for competition. A recent meta-analysis of the extant literature in the exercise and sport domains has identified robust, small-to-moderate benefits of music in the areas of psychological responses, perceived exertion, and physical performance, plus small but significant benefits to physiological functioning. This symposium addresses the scientific basis for music use in exercise and sport, as well as presenting a range of applied examples. A conceptual model will be presented, which identifies the personal and situational variables that influence a range of potential benefits of music. The effects of variables, such as rhythm response, musicality, cultural impact, and associations, are also explained. Paper 1 presents an evaluation of the effects of synchronous music on endurance and feeling states during circuit exercises, which particularly assesses the influence of gender. Paper 2 reports on a study of the influence of familiarity on the arousal and relaxation qualities of music, during imagery use. Paper 3 presents the results of a laboratory investigation of the psychological, physiological and performance benefits of music synchronized to stride rate among elite triathletes. Paper 4 focuses on music applications for athletes, including those that incorporate innovative use of technology. A discussant will provide concluding remarks.

There are three learning objectives for this symposium. Following attendance, participants should be able to: 1) explain the scientific underpinnings for music use in exercise and sport; 2) understand the findings of three empirical investigations of music use in exercise and sport; 3) Know the basics of implementing music interventions with exercisers and athletes.

Ergogenic and psychological effects of synchronous music during circuit-type exercise

KARAGEORGHIS, C. I. (Brunel University), PRIEST, D. L. (Brunel University), WILLIAMS, L. (Brunel University), HIRANI, R. M. (Brunel University), LANNON, K. M. (Brunel University), BATES, B. J. (Brunel University)

Researchers have highlighted the human tendency to synchronize movements with the rhythmical elements of music. Recent findings indicate that when synchronized with movement, music improves performance in a range of aerobic and anaerobic tasks (e.g., treadmill walking, cycle ergometry, bench stepping, 400 m running). Women are exposed to dance and choreographed exercise-to-music classes earlier than men and more frequently; however, gender differences pertaining to the potential benefits of synchronous music have seldom been investigated. The main aim of the present study was to investigate the effects of synchronous music on anaerobic endurance and feeling states during a series of circuit-type exercises. A secondary aim was to explore the possible moderating influence of gender. Participants comprised 13 female and 13 male sport sciences undergraduates. Three synchronous conditions were employed (motivational music, motivationally-neutral [oudeterous] music, and a metronome control). Performance was measured using repetitions to failure and post-task affect was assessed using Hardy and Rejeski’s (1989) Feeling Scale. The data were analyzed using mixed-model 3 (Condition) x 2 (Gender) ANOVAs, ANCOVAs, and MANOVA. Results indicated that synchronous music did not elicit significant ergogenic or psychological effects in isolation. Rather, significant \((p < .05)\) Condition x Gender interaction effects emerged both for total repetitions and mean affect scores. Both women and men produced fewer repetitions in the oudeterous when compared to the motivational condition. Nonetheless, whereas women performed fewest repetitions under the control condition, men performed comparably in the motivational condition. Women and men showed differential affective responses to synchronous music: men experienced more negative feeling states than women in both music conditions. However, the
opposite trend was evident in the control condition. It appears that trained women do not perform better than their male counterparts when synchronous movements are compared. Also, men may be more able to coordinate their movements to a regular beat in the absence of musical stimuli (i.e., a metronome). Therefore, music used for male groups should have high motivational qualities and a particularly prominent beat. Also, practitioners should be particularly sensitive to the affective qualities of music when selecting an accompaniment for women participating in anaerobic exercise.

Quantification of physiological arousal during familiar arousing music, unfamiliar arousing music, and unfamiliar relaxing music during imagery in elite shooters

KUAN, G. (Victoria University), MORRIS, T. (Victoria University), TERRY, P. C. (University of Southern Queensland)

In the current study, we aimed to determine whether arousing music produces higher levels of physiological arousal than relaxing music during sport imagery. This was a precursor to examining the impact on performance of imagery accompanied by music. We examined whether unfamiliar music increased or decreased arousal level during familiar sport imagery. We chose unfamiliar music to minimize confounding effects of past associations. We added familiar arousing music for comparison. 10 elite shooters (7 males, 3 females) performed shooting imagery while we played relaxing music, unfamiliar arousing music, and familiar arousing music. Using a ProComp+ system and BioGraph Software version 5.0 from Thought TechnologiesTM, we monitored blood volume pulse-amplitude (BVP-Amp), heart rate (HR), galvanic skin response (GSR), and peripheral temperature (PT), for consistent patterns of physiological arousal during each type of music, while participants did sport imagery. All participants listened to nine classical music excerpts, chosen by the researchers, before their normal training schedule. Three excerpts were played in each of three training sessions. Resting levels of physiological measures were recorded first. Between music excerpts, participants rested until those levels were reached again. Analysis of variance revealed significant changes on GSR, \( F_{2,162}=15.35, \ p<.05, \ eta^2=.16 \), BVP-Amp, \( F_{2,162}=10.83, \ p<.05, \ eta^2=.12 \), and HR, \( F_{2,162}=24.33, \ p<.05, \ eta^2=.23 \), for different categories of music. There was a significant interaction effect for PT and different categories of music, \( F_{16,162}=1.87, \ p<.05, \ eta^2=.16 \). Unfamiliar arousing music created higher arousal levels than familiar arousing music. Relaxing music showed lower levels of arousal compared to other pieces of music. GSR, PT, and HR showed consistent patterns of interpretation for arousal level of music during imagery. BVP-Amp showed more variable results, which might be due to the highly sensitive measurement of BVP, which could be easily influenced by small amounts of noise. In conclusion, some music may produce greater arousal or relaxation than others. Thus, careful selection of music to be used during imagery rehearsal is important to manipulate arousal level for examining the effect of arousal/relaxation on imagery.

Keywords: physiological arousal, familiar arousing music, unfamiliar arousing music, unfamiliar relaxing music, sport imagery

Effects of synchronous music on treadmill running among elite triathletes

MECOZZI, A. (University of Southern Queensland; Queensland Academy of Sport), TERRY, P. C. (University of Southern Queensland; Queensland Academy of Sport), D’AURIA, S. (Queensland Academy of Sport), KARAGEORGHIS, C. I. (Brunel University)

Research has shown that running in time to music that is synchronized to stride rate can provide significant benefits for sub-elite athletes, although it is uncertain whether such benefits also accrue for elite performers. The present study evaluated the effects of running in time to music on a treadmill using a range of psychological, physiological and performance indices among a sample of elite triathletes. An initial test was conducted to establish aerobic
capacity and individual stride rates at various running speeds. Triathletes were presented with music selections of appropriate tempi for each running speed (i.e., synchronous music), and chose tracks they considered to be (a) motivational, and (b) neutral. They then completed a standardised running test on three occasions in counterbalanced order under three conditions (no-music, motivational music, neutral music). The test protocol involved a warm-up, three 4-minute periods of steady state running at progressively faster velocities, followed by a run-to-exhaustion at approximately 110% of blood lactate threshold. Dietary intake was controlled over the day preceding each test. Measures were taken after each 4-minute period of steady state running and after the run-to-exhaustion for (a) perceived exertion using the Borg Scale; (b) psychological state using the Feeling Scale; (c) oxygen utilization; and (d) blood lactate. Time to exhaustion was recorded and mood responses were assessed prior to and following each test, using the Brunel Mood Scale. Perceived exertion was lower with music than without music even though the same amount of work was completed. Feelings remained more positive throughout the test with motivational music compared to neutral music and no-music. Oxygen consumption was about 3% lower when running in time to music compared to running without music, although blood lactate levels remained almost identical. Compared to the no-music condition, time-to-exhaustion improved by more than 12% when running in time to music. Mood responses were more positive with music. Results confirmed the hypothesized benefits of music but suggested that synchronicity of the music to the activity may be more important in functional terms than the motivational qualities of the music.

Keywords: synchronous music, treadmill running, elite athletes, performance, motivational qualities

Music applications for athletes

TERRY, P. C. (University of Southern Queensland)

Empirical and anecdotal evidence of the benefits of music for athletes has grown over the past decade. Michael Phelps, the most successful Olympian of all time, listens to music until about two minutes before his races start and has attributed part of his phenomenal success to this practice. The aim of this presentation is to demonstrate ways in which the evidence base can be applied in practice. A range of evidence-based music applications for athletes is discussed. First, use of inspirational music is presented, giving examples from bobsled and trap shooting. Secondly, manipulation of pre-competition mindset using music is explained, giving examples from rowing, boxing and athletics. Thirdly, the role of music in rehabilitation from injury is exemplified, based on work with a six-time kayak world champion incapacitated by chronic fatigue syndrome and unable to compete. Fourthly, the incorporation of innovative use of technology to enhance the effects of music is presented and discussed. Brainwave training utilising the flicker response delivered via custom-made glasses to promote alpha wave activity was shown to be an effective mood regulation strategy when used in conjunction with music among shooters at the 2006 Asian Games. Similarly, music used in conjunction with analysis of EEG activity was utilised among shooters preparing for the 2008 Olympic Games. Firstly, individualised links between brain activity and best shots were assessed using on-range EEG analysis, followed by neurofeedback training (NFT) to promote ideal brain activity. Next, music with associations of winning was used during NFT to promote a conditioned response. This music was then used as a pre-task stimulus to promote ideal brain activity during performance. Finally, a recent innovation has incorporated appropriate music, words and photographs into a PowerPoint presentation, converted it into an mp4 file and loaded the presentation onto a mobile phone for viewing by the athlete as and when required. The principles and practice of using music interventions with athletes has been demonstrated and discussed. The evidence-based examples described in this presentation provide a guide for applied sport psychology practitioners to implement music interventions with elite athletes.

KidsMatter: Early childhood services and primary schools mental health initiative

Chair(s): LITTLEFIELD, L. (Australian Psychological Society)

KidsMatter is an Australian mental health promotion, prevention and early intervention initiative specifically developed for early childhood services and primary schools. KidsMatter is informed by the World Health Organization’s (1994) Health Promoting Schools Framework, and incorporates primary, secondary and tertiary approaches to prevention and intervention. KidsMatter uses an evidence-based framework focused on risk and protective factors for children’s mental health. It aims to improve the mental health and wellbeing of children, reduce mental health difficulties amongst children, and increase support and assistance for children experiencing mental health difficulties. This symposium will provide an overview of the KidsMatter framework and implementation process; report on evaluation findings from the pilot of KidsMatter Primary throughout 2007 and 2008; provide a case study of a school that implemented KidsMatter and update on the broader dissemination of KidsMatter Primary; and outline the adaption of the KidsMatter initiative for children aged birth to school age.

Overview and implementation of KidsMatter Early Childhood and Primary initiatives

LITTLEFIELD, L. (Australian Psychological Society)

KidsMatter Early Childhood (0-5 years) and KidsMatter Primary (5-13 years) are Australian mental health promotion, prevention and early intervention initiatives specifically developed for early childhood services and primary schools. The KidsMatter Initiative was developed in response to national concern for children’s mental health and the need for coordinated and strategic action. KidsMatter recognises the critical role that early childhood services and primary schools have in enhancing factors that support children’s mental health and wellbeing. KidsMatter provides these services with a framework, an implementation process, ongoing implementation support, and evidence-based resources needed to develop strategies to support the specific mental health needs of children. KidsMatter uses an evidence-based framework that aims to strengthen children’s mental health by enhancing protective factors and reducing risk factors for poor mental health. KidsMatter is implemented through four key components: creating a positive community; strengthening children’s social and emotional competence; providing parenting support and education; and assisting access to early intervention. External evaluation showed KidsMatter Primary to be a successful initiative. KidsMatter Primary is now strengthening partnerships with State/Territory education and health systems to support broader implementation. KidsMatter Early Childhood will be piloted in long-day care centres and preschools during 2010-2011. This presentation will describe the four components, the implementation process and highlight the critical success factors of KidsMatter. The evidence-base underlying the KidsMatter framework and implementation model will also be discussed.

Keywords: KidsMatter Early Childhood, KidsMatter Primary, primary school, children’s mental health

Upscaling the KidsMatter Primary pilot initiative

TRINDOR, M. (Australian Psychological Society), LEARY, H. (Benalla Primary School)

Schools are an important setting for population health initiatives aimed at improving children’s mental health. Following successful evaluation, initiatives require broader dissemination, or upscaling, within relevant systems. External evaluation showed KidsMatter Primary to be a successful promotion, prevention and early intervention initiative. However, upscaling the KidsMatter Primary pilot presented a unique set of challenges. Crucial to broader implementation was the need to maintain key success factors, particularly implementation
support for schools and professional learning for all school staff. Links between KidsMatter Primary, education sectors, and local health and community agencies also needed to be strengthened. A structure to promote systemic implementation was also developed in the form of Regional Leadership Groups to support KidsMatter schools in a common district. Central to all upscaling considerations was the need to incorporate ongoing monitoring to maintain quality assurance. This presentation will firstly present a school case study to detail the process and benefits of the KidsMatter implementation model. Following this, it will provide an overview of the upscaling of the KidsMatter Primary Initiative after a successful pilot evaluation. The presentation will reflect on models of upscaling developed in the international literature, outline the development of strategies for implementing the KidsMatter Primary initiative more widely, and discuss challenges of upscaling pertaining to adapting service delivery and quality-assurance.

Keywords: Schools, KidsMatter Primary, children’s mental health, school staff

KidsMatter Primary pilot evaluation: Improving mental health

DIX, K. L. (Flinders University), LAWSON, M. (Flinders University), SKRZYPiec, G. (Flinders University), ASKEll-WILLIAMS, H. (Flinders University), SPEARS, B. (Flinders University), SLEE, P. (Flinders University)

The broad purpose of the study was to evaluate the effectiveness of KidsMatter Primary and, in particular, the change over time in the mental health and wellbeing of almost 5000 children, in 100 primary schools across Australia. The complex longitudinal study involved the parents or caregivers and teachers of students, who were tracked over two years, with questionnaires completed by informants on four occasions. The questionnaire contained scales that addressed aspects of KMP implementation, the four components, school, family and child protective factors, as well as assessments of mental health difficulties (Goodman’s Strengths and Difficulties Questionnaire) and wellbeing (CASEL). In order to assess change over time that were of statistical and practical significance, Hierarchical Linear Modelling (HLM) provided analytic techniques that were appropriate for large-scale, longitudinal, complex nested data. KMP achieved its major aims to improve student mental health and well-being and reduce mental health difficulties, particularly for those students considered to be in the ‘borderline’ or ‘abnormal’ ranges of mental health. KMP achieved a shift for a number of students within the ‘borderline’ and ‘abnormal’ ranges, into the ‘normal’ range, with improvement for as many as 1 in 10 children, depending on how mental health was assessed. KMP had a positive impact on schools, teachers, parents, and children. It facilitated activities around the 4 Components, strengthened protective factors within the school, family and child, and improved student mental health.

KidsMatter Early Childhood

LAWRENCE, J. (The Australian Psychological Society)

The KidsMatter Early Childhood initiative is an adaption of the KidsMatter Primary initiative for use in long day care and preschool/Kindergarten settings. KidsMatter Early Childhood is being piloted in 110 early childhood services throughout Australia in 2010 and 2011. Adapting KidsMatter for children aged birth to school age required consideration of the unique needs of young children, families and early childhood services. This involved revising the materials, content and processes of KidsMatter Primary for a younger age group and different setting, and incorporating what was learnt from the KidsMatter Primary pilot. The adaption also involved incorporating into the framework knowledge of relevant influences on mental health in the first 5 years of life, such as key developmental tasks and milestones, the formation of attachment relationships, and understanding the unique manner in which early childhood services embed social and emotional learning into the daily experiences of young children. This presentation will outline the process of adapting the KidsMatter
Early Childhood initiative. It will detail the changes to the KidsMatter implementation framework relevant to the birth to 5 age range, and discuss unique influences on mental health in this age group. Initial experiences of KidsMatter early childhood services who are participating in the pilot will also be reported.

Keywords: KidsMatter Early Childhood, day care, preschool, children’s mental health

Leadership and social identity at work: Practical applications of novel theory

Chair(s): HASLAM, A. (University of Exeter)
Discussant(s): PETERS, K. (University of Exeter)

“The leaders who work most effectively, it seems to me, never say ‘I’. And that’s not because they have trained themselves not to say ‘I’. They don’t think ‘I’. They think ‘team’. They understand their job to be to make the team function…. There is an identification (very often quite unconsciously) with the task and with the group.” (Drucker, 1992, p.14). These are the observations of the eminent management theorist Peter Drucker, reflecting on what makes some leaders more successful than others. These ideas are also echoed in the observations of a great many other writers — all of whom recognize that leadership is much more a ‘we thing’ than an ‘I thing’. Yet if one searches for research that might validate his insights or, better still, explain why they are correct, the story is very different. For such research is thin on the ground. What is original about this symposium, then, is that it attempts to do justice to observations like those of Drucker by providing an analysis of leadership in which the terms of the theoretical treatment are matched to the nature of the phenomenon. If leadership really is a ‘we thing’ (and we believe it is) then we need to understand what this means, where it comes from, and how it works (see Haslam, Reicher & Platow, in press). The aim of this symposium is to provide such an analysis and to demonstrate its utility in relation to important practical problems of leadership in the field. These concern (a) the relationship between pay and organizational performance, (b) the path from leadership to followership, (c) the challenges faced by women in climbing the career ladder, and (d) the dynamics of charismatic leadership. In this, the symposium’s learning objectives are both theoretical and applied.
Are we all on the same team?: A longitudinal analysis of the relationship between pay and performance in the university sector

HASLAM, A. (University of Exeter)

Previous research suggests that the salaries of senior managers are a very poor predictor of organizational performance. This makes sense in terms of a social identity analysis which suggests that high executive salaries undermine a sense of shared organizational identity. However, previous studies in this area have been compromised by limited data. This study examines these issues in the context of UK university performance by examining the relationship between university rankings and (a) vice chancellor pay, (b) average staff member pay, and (c) the discrepancy between (a) and (b) over an 11-year period (1998-2009).

It was found that: (a) V-C pay is a good predictor of future performance (mean $r = .35$) and (b) performance is a good predictor of future V-C pay (mean $r = .40$); (b) the pay of an average staff member is an extremely good predictor of future performance (mean $r = .64$) and (c) performance is an extremely good predictor of the future pay of an average staff member (mean $r = .59$); (d) the relative difference in pay between the V-C and an average staff member is a good predictor of future under-performance (mean $r = -.32$) but (e) under-performance is a relative weak predictor of the relative future difference in pay between the V-C and an average staff member (mean $r = -.21$). These patterns are consistent with findings from previous experimental work in the social identity tradition (e.g., Haslam, Reicher & Platow in press). This suggests that group performance is highest when all group members (leaders and followers alike) share the rewards of group success. This is because pay sends strong signals about shared identity and this is necessary for leaders to motivate other organizational members to contribute to the collective endeavour, as it is those members’ endeavour that ultimately delivers (and is the measure of) group success. Note, though, that these arguments go against the mantra of the prevailing “trickle-down” management theory, which suggests that (highly paid) leaders alone are the key to improved organizational performance.

How leadership materializes from followership

JETTEN, J. (University of Queensland)

Two studies tested among natural small groups, who within a group over time, was most likely to emerge as a group leader. We tested whether perceived typicality perceptions within the individual (Time 1) or perceived typicality as defined by the group (i.e. followership at Time 1) was the best predictor of leadership at Time 2. In Study 1, students at a summer school took part twice, with 10 days in between measurement times ($N = 87$, 14 groups). In Study 2, 22 tutorial groups with 4 to 5 psychology students per group ($N = 94$) were approached at the beginning of the academic year and again six months later. In both studies, we assessed normative group and self-ratings, perceived self-prototypicality, followership (i.e. I am doing what others see as normative for my group), and leadership coefficients (i.e. what I see as normative is behaviour demonstrated by my fellow group members). In both studies, we found that self-perceived prototypicality at Time 1 did not predict leadership at Time 2, but we found that followership at Time 1 predicted leadership at Time 2. Our results thus show that those better matching the collectively defined prototype of the group at an early stage of group life developed a greater understanding of how the group is shaped by its members and how the group collectively defines the prototype of the group. Self-prototypicality, formed within the individual in isolation from the group context, did not predict leadership over time. Our results show that those better matching the collectively rather than individually defined prototype of the group at Time 1 develop a greater understanding of how the group is shaped by its members and this led to prototype based leadership. We propose a refined and dynamic model of the antecedents of leadership and highlight the importance of the group...
prototype as collectively, interactively and dynamically defined.

Keywords: leadership, perceptions, group processes, group membership, prototype

Fitting in or opting out: How perceptions of leadership impact on women’s career ambition

RYAN, M. (University of Exeter)

Across almost all high-status careers and high-status positions within organisations women’s representation remains stubbornly low. Some commentators argue that this continued under-representation is due to women’s lack of career ambition and their tendency to ‘opt-out’ – either by deciding not to climb the career ladder or by leaving the workplace altogether. This paper seeks to present data which tests between these alternative views. Surveys and experimental data was obtained from the UK police force, UK surgeons, and the Dutch Civil Service. Findings suggest that while gender differences in career ambition are present, such differences are not intrinsic. In particular, evidence demonstrates that, to the extent that women perceive that they do not fit in with leaders in their field, they also express lower levels of career ambition and organisational identification, and a greater desire to opt-out from their jobs (but, not necessarily their careers). By shifting the focus away from the ways in which women are implicated in their own lack of success and on to workplace experiences and perceptions, this research has practical implications for organisations and professional bodies that wish to promote gender equality. Interventions to increase women’s fit (and ambition) that are currently underway will be discussed.

Keywords: career, perceptions, leadership, women, career ambition

Understanding the basis of leader charisma: The importance of ‘doing it for us’

PLATOW, M. (University of Queensland)

In the original Greek, charisma has multiple meanings — including the power to perform miracles, the ability to make prophecies, and the capacity to influence others. Generally, though, the term is taken to refer to the idea of a leader’s ‘special gift’. Generally, though, the dynamics of this process are poorly understood. This paper reports data from a number of experiments which manipulate the degree to which a leader (a) is prototypical of a group, (b) speaks on behalf of a group, and (c) is associated with group success and looks at the impact of these on attributions of charisma. These studies are also supplemented by survey data from a number of applied settings. When leaders are in-group prototypical, ratings of their charisma are relatively high, regardless of their rhetorical style. However, when they are in-group non-prototypical, ratings of their charisma were also relatively high if their rhetoric is transformational and emphasizes the collective (‘us’). In contrast, when leaders are non-prototypical and couch their messages in transactional terms, they are perceived to be particularly uncharismatic. These patterns are also moderated by the success of the group activity itself. Charisma does indeed appear to be a ‘special gift’. However, this is not a gift that they possess, and it is certainly not a characteristic of their personality. Rather, as Platow and colleagues suggest in the title of the paper in which the above two studies were reported, it is a gift that followers bestow on leaders for being representative of ‘us’. This is a gift that leaders have to earn by representing and championing the group, not one they are born with and can take for granted.

Keywords: leadership, charisma, group processes, group success, collective
Leadership: Understanding its role in a broader organizational context and perspective

Chair(s): WANG, L. (Peking University)
Discussant(s): PENG, K. (University of California at Berkeley)

This symposium centers on leadership style and its relation to variables inside and outside of the occupational fields, including leaders’ color preference, customer’s satisfaction, and employee’s turnover intention, psychological health, and OCB. In the first study, the authors examined the role of subordinate’s gender in the relationship between leader’s color preference (black or white) and subordinate’s perception of leadership style. Based on experiments with 253 participants in 6 organizations, the authors found that leader’s color preference did not show a significant effect on subordinate’s perception of leadership style. However, gender differences played a moderating role in two of the three dimensions of leadership style: benevolence and morality. The second presentation reports the mechanism and marginal condition in the relationship between transformational leadership and turnover intention. The findings indicate that subordinates vary substantially in the degree to which they embrace transformational leadership and in turn give up turnover intention, and that individual power distance is a significant construct driving these differences. Therefore, the impact of transformational leadership should be carefully assessed with the understanding that it is subject to the influence of individual values. In other words, subordinates value is an important boundary condition for the effectiveness of transformational leadership. The third speaker will present a study on the moderating role of powder distance on the relationship between abusive supervision and employees’ psychological health. People generally believe that abusive supervision leads to employees’ poor psychological health. However, the fundamental values of power held by employees will have an impact on this relationship. Using 825 Chinese employees, the authors found that abusive supervision had a negative impact on followers’ mental health, but this effect emerged only for subordinates lower in power distance orientation. The last presentation will report a multi-level study investigated how leadership styles impact on the relationship between followers’ organizational citizen behaviors (OCB) and customers’ satisfaction. This study used participative management, charismatic leadership, instructional leadership, amiable humor, and expression of emotion to determine which aspect of leadership has the strongest influence. Among them, charismatic leadership and expression of emotion, as moderators, played a relatively important role such that less charismatic leadership and more emotional expression exhibited stronger positive effects of followers’ OCB on customers’ satisfaction.

Leader’s color preference and subordinate’s perception of leadership style: The moderating role of gender differences

YU, K. (Peking University)

Subordinate’s perception of leadership style has important practical implications in modern organizations. Researchers have been exploring many factors that could impact it. This study aimed to examine the relationship between leader’s color preference (black or white) and subordinate’s perception of leadership style, and the moderating effect of subordinate’s gender. 253 participants from six organizations were randomly assigned to two groups. Participants in each group read a simple description of a fictitious leader with the same traits (such as intelligent, diligent, deft, etc.) and the leader’s color preference of either black or white and subordinate’s perception of leadership style, and the moderating effect of subordinate’s gender. 253 participants from six organizations were randomly assigned to two groups. Participants in each group read a simple description of a fictitious leader with the same traits (such as intelligent, diligent, deft, etc.) and the leader’s color preference of either black or white for each respective group. After this, participants were required to imagine the leader’s characteristics and then rate the leader on the 15-item Paternalistic Leadership Scale, which included dimensions of authoritarianism, benevolence, and morality. Results: Results showed that leader’s color preference did not show a significant effect on subordinate’s perception of leadership style. However, the interaction between color preference and the subjects’ gender is
significant in two dimensions of leadership styles. For benevolence, male subjects rated the leader higher on this dimension when the leader liked white (t = -2.794, p < .01), while female subjects’ judgments were not affected by color preference of the fictitious leader (t = .895, p > .30). For morality, male subjects’ judgments were not affected by color preference of the fictitious leader (t = -1.349, p > .15), whereas female subjects judged the black-preference leader higher in morality (t = 2.084, p < .05). For subjects’ rating on the leader’s authoritarian, the interaction between subject’s gender and the leader’s color preference fell short of significance (F = .098, p > .10). Based on the above results, color preference of the leader was found to be a factor on the subordinate’s perception of leadership style, whereas gender differences played a moderating role in two of the three dimensions of leadership style: benevolence and morality. The relationship between leader’s color preference and subordinate’s perception of leadership style differs among subjects with different gender.

**Keywords:** colour preference, perceptions, leadership style, gender differences, authoritarianism

**Transformational leadership influences turnover intention through the mediating effect of interactional justice: The moderating role of power distance**

FLETCHER, L. (Vassar College)

It’s generally believed that transformational leadership can improve the subordinates’ attitude. This study further revealed its mechanism and marginal condition. The authors explored how individuals’ values (power distance) influence their responses to transformational leadership and how these responses, in turn, influences turnover intention through the mediating effect of interactional justice. Participants in this study were 825 front-line workers of a large manufacturer in China. We distributed and collected questionnaires on-site in the company, and small gifts were sent to participants through the company’s HR department. All questionnaires were filled out in paper-pencil manner. Results showed that the mediating effect of interactional justice for transformational leadership was significant (z= -5.64, p < .001). Transformational leadership was interacted with power distance to affect interactional justice (β= -0.09, p < .05), and interactional justice was interacted with power distance to affect turnover intention (β= 0.10, p < .05), that is, the power distance has moderating effect in the first and second stage. Moreover, the simple indirect effect of transformational leadership (through interactional justice) was stronger at low levels of power distance (β=- .303, p < .001) than at high level of power distance (β= -0.072, p= .0182). Our findings indicate that subordinates vary substantially in the degree to which they embrace transformational leadership and in turn give up turnover intention, and that individual power distance is a significant construct driving these differences. Therefore, to use transformational leadership style for subordinates, especially for the low power distance individuals, can quickly enhance their interactional justice perception and reduce turnover intention. On the other hand, it should pay more attention to those high in power distance since the transformational leadership may not effectively influence those individuals’ interactional justice and turnover intention.

**Keywords:** transformational leadership, turnover intention, interactional justice, power distance

**When is abusive supervision not related to employee psychological health? The moderating effect of individual power distance orientation**

LIN, W. (Peking University)

People generally believe that abusive supervision leads to employees’ poor psychological health. However, this relationship is not always true. The fundamental values of power held by employees will have an impact on this relationship. This study examined how individual power distance orientation (defined as the extent to which an individual accepts the unequal distribution of power in institutions and organizations) affects the relationship between abusive supervision and employees’ psychological health. In one
sample, 825 employees from a manufacturing company located in southeastern China rated their power distance orientation, psychological health, and their perceptions of abusive supervision. Results showed that abusive supervision was negatively associated with followers’ psychological health \((r = -0.199, p < .01)\). The relationship between abusive supervision and employees’ mental health was moderated by individuals’ power distance orientation \((R^2 = 0.11, \beta = 0.107, p < .05)\), such that this relationship is statistically significant for followers who were lower in individual power distance orientation \((\beta = -0.259, p < .01)\), but not statistically significant for followers who were higher in individual power distance orientation \((\beta = 0.085, p = 0.481)\). Abusive supervision has been seen as a significant social problem which would ruin followers’ mental health. This study extends previous research by showing that interactive effects of abusive supervision and followers’ power distance orientation help explain psychological health among followers. The findings suggest that focusing on fundamental values held by employees contributed to a better understanding of the impact of leader’s deviant behaviors. In addition, the interaction of leadership and values followers held in relation to mental condition and employee reactions provide an interesting area that needs further exploration in order to enhance our understanding of when and how leaders affect those they lead.

**Keywords:** abusive supervision, psychological health, power distance orientation, leadership

**Leadership moderators for the relationship of followers’ OCB and customer satisfaction - Participative management and leader emotion expression**

LI, H. (Peking University)

This multi-level study investigated how leadership styles impact on the relationship between followers’ organizational citizen behaviors (OCB) and customers’ satisfaction. This study used participative management, charismatic leadership, instructional leadership, amiable humor, and expression of emotion to determine which aspect of leadership has the strongest influence. Participants represented 96 services teams working in a large telecommunication company, where each team comprised a geographically isolated branch of the company. We investigated 96 unit supervisors and 4 or 5 sales representatives for each supervisor \((n=392)\) and two customers for each sales representative \((n=784)\). The above mentioned five aspects of leadership, followers’ OCB and customers’ satisfaction right after service were measured. HLM analysis revealed that the effect of followers’ OCB on customer satisfaction was moderated by participative management \((\beta = -6.16, p < .01)\), charismatic leadership \((\beta = 0.23, p < .05)\), instructional leadership \((\beta = -7.76, p < .01)\), amiable humor \((\beta = -6.93, p < .01)\), and expression of emotion \((\beta = -5.78, p < .01)\). However, step-wise regression analysis demonstrated that the interaction between OCB and charismatic leadership was the largest (explaining 31% of the variance of customers’ satisfaction). After controlling for this interaction, only leaders’ expression of emotion with customers’ satisfaction reached statistical significance. When both of these interactions were controlled participative management, instructional leadership and amiable humor no longer interacted with followers’ OCB. Based on the obtained results, several leadership aspects had moderating effects on the relationship between followers’ OCB and customers’ satisfaction right after service. However, among them, charismatic leadership and expression of emotion, as moderators, played a relatively important role such that less charismatic leadership and more emotional expression exhibited stronger positive effects of followers’ OCB on customers’ satisfaction.

**Keywords:** leadership styles, customer satisfaction, emotion expression, organisational citizen behaviors, charismatic leadership
Life designing: A paradigm for career construction in the 21st century

Chair(s): VAN ESBROECK, R. (Vrije Universiteit Brussel)

Discussant(s): MAREE, K. (University of Pretoria)

The post-modern world is characterized by globalization and unpredictable fast changes. This puts heavy demands on the existing career theories and guidance techniques. The present theories are, however, rooted in a modern world characterized by stability, and by predictable and slow changes. Because of this situation, there is now, within the career guidance field, a strong demand for a new and adapted approach. A group of international scholars, who are strongly involved in the guidance and counseling practice, are proposing a new paradigm to respond to these new demands. They no longer speak about “career development” or “vocational guidance”, but concentrate on “life trajectories” and “construction” in which the individuals design their own lives including their work career. The main question is no longer which career shall I choose, but what am I going to make of my life? This approach has far-reaching consequences on career interventions, which should be refocused. Also, career counseling needs to be restructured and the co-evolution of the individual, the economy and society recognized. This will require new basic suppositions and a new framework. Counselors and other guidance workers will need more flexibility with regard to their aims, instruments and “where” they conduct their support. The presenters will, within the scope of this symposium, tackle the different issues and sketch a framework to highlight their position. The learning objectives of this symposium are to (1) Develop an awareness of the need for new paradigms in the 21st century, (2) Recognize that work role is part of a broader set of life-roles, and (3) Learn about a new counseling method and its implication for practice and training.

Life designing: Framework and introduction

SAVICKAS, M. (Northeastern Ohio Universities College of Medicine)

In the 21st century, a new social arrangement of work poses a series of challenges to scholars who aim to help people develop their working lives. The theory of career construction and its life-designing counseling model endorse five presuppositions about people and their work lives: contextual possibilities, dynamic processes, non-linear progression, multiple perspectives, and personal patterns. Thinking from these five presuppositions, the life design international research team has crafted a contextualized model based on the epistemology of social constructionism, particularly recognizing that an individual’s knowledge and identity are the product of social interaction and that meaning is co-constructed through discourse. The life-design framework for counseling implements the theories of self-constructing (Guichard, 2005) and career construction (Savickas, 2005) that describe vocational behavior and its development. Thus, the framework is structured to be life-long, holistic, contextual, and preventive. The life-design framework for counseling interventions aims to increase clients’ adaptability, narratability, activity, and intentionality. The life-designing model assists individuals to formulate adaptive responses to developmental tasks, vocational traumas, and occupational transitions. In addition to fostering adaptability, the interventions seek to increase clients’ narrative competence in telling an autobiographical story that portrays their career and life with coherence and continuity. The story should enable clients to better understand their own life themes, vocational personality, and adaptability resources. In addition to enhancing narratability, activity must be exercised to produce significant changes in “conclusions” of the life stories of many people and in particular of those that seem already written. Thus, life-designing interventions encourage clients to engage in activities in the different domains of life. By engaging in diverse activities, individuals learn which abilities and interests they prefer to exercise. Action is central to life-
designing interventions thinking because it involves behavior plus meaning. The meaning may arise from prospective aspiration or retrospective reflection. Either way, the intentional process is central to the tasks of designing a life and constructing a career. In sum, life-designing interventions foster development through adaptability, narratability, intentionality, and action.

The role of the theory of career construction and self-constructing in life-designing

GUICHARD, J. (Institut National d’Etudes du Travail et d’Orientation Professionnelle)

The aim of this study is to outline a theoretical framework for life-designing interventions. Two similar models will be summarised: The Career Construction Model and the Self-Constructing Model. Both of these models refer to the epistemology of social constructionism and assert that (a) an individual’s knowledge and identity are the product of social and cognitive processes taking place in context of interactions between people and groups as well as negotiation between them, and (b) the meaning an individual gives to reality is co-constructed in a social, historical and cultural context through the discourse with which we form our relationships. Their difference lies in that the Career Construction Model puts a greater emphasis on career construction and the Self-Constructing Model emphasises identities construction. Career Construction theory describes career as a moving perspective that imposes personal meaning on past memories, present experiences, and future aspirations by patterning them into an evolving life theme. It is the meaning contained in these biographical themes that will equip individuals to adapt to the social changes that are playing out in their work lives. Self-constructing approach shares this view but understands career construction as only one element in identities construction.

It considers career as an occupational “subjective identity form” (SIF), as a piece of a broader structure. A SIF denotes a set of ways of being, acting, and interacting in terms of a certain view of oneself in a given context (past, present or future). “Identity” is seen as plural and evolving: It is described as a dynamic system of subjective identity forms, in which some of them (often the occupational one) plays a core role. These models constitute two perspectives on the life designing issue. Career construction sees it as a major question addressed to individuals: What is the meaning of my career in my life? Self-construction would formulate it this way: What in my life (could) give it a meaning to me? These models are complementary. Perhaps the first question is more likely to be the one of mature adults and the second one that of adolescents or emerging adults.

Keywords: life-designing, career construction, self-constructing model, cognitive processes, career

Restructuring career counseling: objectives and instruments

DUARTE, M. E. (University of Lisbon)

The life-design framework for counseling aims to face counseling as a process of continuous interactions, which helps in the resolution of problems, which places the process of decision making within a systematic and realistic frame, and which allows the conjunction of the necessities of individuals with those of the contexts they act, develop and live. Thus, the framework is structured to be life-long, holistic, contextual, and preventive. From theory we will use intervention methods and techniques: the development of self-knowledge and ecological variables, facilitating or inhibiting in decision making processes. The stories and activities developed by individuals are the focal point concerning methodological aspects instead of utilization of test scores or profile interpretations. The existing techniques and tools are reconfigured for use in a social constructionist approach. The presentation and discussion of a case study following the outline of the life-design career counseling illustrates this new way to face career counseling. The international life-design research group has set several projects for the development of life-design intervention model. Some of these projects are presented.

Training practitioners for life-designing

NOTA, L. (University of Padova), SORESIS, S. (University of Padova)

Huge challenges confront vocational guidance in the 21st century. Practitioners must be ready to deal with them if they are to succeed in supporting and helping those individuals who risk making inadequate choices or having unsatisfactory prospects. In order for counselors to pursue significant aims, their training must be carefully planned and assessed. Emphasis would be placed on (a) future counselors’ active participation during their training, (b) reduction of the gap existing between the world of research and that of training and application, (c) ensuring that graduates model what they will advocate, and (d) preparing counselors for collaborative projects (Savickas et al., under review). Fifty career counselors and career service providers (mean age 40 years; 40% male and 60% female) were involved in this study. They had a degree in different subjects (education, humanities, economics but mostly in psychology) and worked in diverse contexts (vocational guidance centers, school services, private practice). They reported a range of one to 15 years of experience in providing career service. All participants completed a battery of measures, to assess professional self-efficacy, professional goals and satisfaction, and an open-ended questionnaire that examined their beliefs regarding vocational guidance, before and after the training. The training had been planned based on the points outlined above and special emphasis had been placed on the issues of the Life-design model. It consisted of 120 hours, with 8-hour sessions every two weeks, over a period of 8 months. The analyses carried out show that, after the intervention, the practitioners showed higher levels of professional self-efficacy beliefs, more specific professional goals, and higher levels of satisfaction. Moreover, they tended to consider vocational guidance as a “discipline of change” and counselors as change agents rather than professionals that deal mainly with diagnoses, or with more or less accurate predictions. These results will be discussed in light of our conviction that counselors themselves should show clear identity and strong adaptability; they should emerge from training as proactive, self-determined professionals with high levels of self-efficacy for performing their professional duties.

Managing challenging behaviours in dementia

Chair(s): BIRD, M. (NSW Greater Southern Area Health; ANU)

Challenging behaviour associated with dementia includes phenomena such as violence or verbal aggression, screaming or yelling, sexual disinhibition, dangerous wandering and a host of other behaviours. It is a major source of distress for home carers and therefore a common reason for admission to permanent residential care, where behaviours tend to be even more florid and cause equivalent distress to nursing home staff. The most common treatment remains prescription of antipsychotics, despite two decades of meta-analyses showing that they are marginally effective at best and have dangerous side effects. Each speaker will illustrate different aspects of this complex work. Delegates will understand more about the phenomenology of this problem, the multi-facetted nature of management, and how clinical psychologists with the requisite skills, knowledge and flexibility can make a major contribution to improving care of these patients and improving life for those who care for them.

What is challenging behaviour and how should it be approached

BIRD, M. (NSW Greater Southern Area Health; ANU)

The aim of this paper is to introduce the nature of challenging behaviour in dementia, and the rationale for the hypothesis-testing case-specific approach which has been used in all successful psychosocial treatment trials, most of them led by clinical psychologists. A case study and evidence from the literature will be presented to illustrate the multi-facetted nature of these problems, in particular the multiple potential causal factors that can lead not only to the behaviour but also to any given behaviour causing sufficient distress to carers or care staff to become a clinical case. Causes of behaviour include factors intrinsic to the person with dementia, for example pain, delirium or past history and external factors such as the way care is carried out, or features of the physical or sensory environment. These vary widely case to case. The level of staff or home carer distress also varies widely and is dependent upon factors such as attitude to the person with dementia, level of knowledge about dementia or about the patient, care skills, or how much practical or emotional support is available. Accordingly, each case is different, and the role of the clinician is to assess which causal factors apply – often in collaboration with other disciplines, determine which of them is remediable, devise a realistic intervention package and, equally devise a means to maximize compliance with the plan given that it often requires carers to change their behaviour.

Case studies in residential care

HUDGSON, C. (Deakin University and Eastern Health, Victoria), DAVISON, T. (Deakin University and Eastern Health, Victoria)

The aim of this paper is to illustrate in detail the nature of clinical work both people with dementia who manifest challenging behaviour, and those who care for them. Cases will be chosen which illustrate various facets of the role of the clinical psychologist with this population, including detailed assessment, the range skills and knowledge required – including areas well beyond the normal requirements of clinical psychology, and working with nursing and care staff, and with specialist medical practitioners. These cases will also illustrate the heterogeneous nature of the population outlined in Paper 1.

Keywords: dementia, challenging behaviour, assessment, clinical psychology, care staff

Support and training of caregivers: A critical review and implications for clinicians

TURNER, J. (Sydney University), MATTHEWS, M. (Sydney University)
Those who provide care to older adults with dementia, whether family/home carers or institutional staff in residential facilities, often experience stress and depression, and feel burdened by their responsibilities. The aim of this paper is to provide a brief review of the history of the caregiving literature, followed by a review of the more recent literature and current research related to supporting and/or training caregivers of older adults with dementia. Based on the review this paper will offer recommendations for clinicians interested in providing assistance to institutional care staff or family carers in managing older people with dementia. The method involved reviewing research articles published in the last 25 years (since 1985) that: included caregivers of older adults with dementia (> 64 years), provided a direct measure of caregiver behaviour (of either family/home or institutional carers), and/or the care recipient behaviour, and provided a clear description of environmental or psychosocial intervention procedures. Articles meeting criteria fell into a number of categories including: psycho-educational and/or skill-building group classes for family carers; in-service training programmes on the psychosocial management of behaviour disturbance for residential care staff; brief training of staff in the use of specific behavioural procedures; and an integrative approach of didactic and experiential learning methods, including a supervision and mentorship component for care staff. A minority of studies that report benefits of interventions for carers provide objective evidence, and of those, very few also assess outcomes for the dementia sufferer. Positive results are reported for programmes that are proactive in directly training carers in specific management techniques, and for approaches that address the emotional states and attitude of care staff. The implications for clinicians working with caregivers are discussed.

**Keywords:** dementia, caregivers, older people, care staff, family carers

**Maximising compliance with interventions in residential care (Panel discussion)**

Nearly every intervention in residential care requires at least some change in the behaviour of care staff, some of whom may be demoralized, some cynical, some of low education, some speaking limited English, many paid very low wages, and all of whom will be very busy. The aim of this discussion is for each panelist to talk about some of the problems they have faced in obtaining compliance with interventions, and how they go about maximizing the chances that interventions will be carried out.

Measures to aging in Japan

Chair(s): RENGE, K. (Tezukayama University), PRIBYL, C. (Otsuma Women’s University)
Discussant(s): KASHIMA, Y. (Melbourne University), KAKIMOTO, Y. (Jissen Women’s University)

Japanese Association of Applied Psychology has held invited symposiums relating to social problems and the contributions of applied psychology in Japan at the last two ICAP in Athens and in Singapore. This symposium will focus on explaining social problems by aging as well as on discussing measures to aging in Japan in order to tackle the impact of ageing on society in the world, because Japan is surely one of the most developing countries of aging, and as a result various measures have been executed. Social problems of elderly people, such as 1) supports in communities, 2) road safety, 3) aging in city and in country, and 4) health, are explained and discussed in the symposium. An American and a Japanese chairperson will moderate the symposium. Two discussants from Japan and from Australia will also join to the discussion. The symposium surely leads to bring better understanding of aging society and the measures to it for the participants from all over the world. The key learning outcomes are: (1) to increase the awareness of researchers of a variety of the social impacts of aging, (2) to introduce measures against negative influences of aging to society, (3) to encourage practical experts to tackle the measures of ageing in the world, and (4) to communicate with researchers and experts in the world to make better measures.

The characteristics of psychosocial problems for the elderly in Japan

NAKAO, H. (Kyushu University)

The purpose of this oral presentation is to show evidence of the characteristics of psychosocial problems for the elderly in Japan. The first of these is the activities for the formal social group for the healthy elderly called the “Rogin Club”, which was supported by the Japan Government from 1962. About 30% of the population over the ages of sixty years participates in the group in order to obtain the “IKIGAI” (corresponding to the meaning of life) which is the biggest social group for the community-dwelling elderly in Japan. The second piece of evidence is the consciousness of supporting older parents, as mentioned by both the elderly and young adults. The differences of the ideas concerning the relationships between the supporters and the dependents in the families mentioned by both the young and elderly people among Japan and China will be discussed on the basis of the larger cross-cultural study in 2006 and 2008. The third of piece of evidence is the psychological problems of the formal care insurance system for the frail elderly which started from 2000 in Japan as the second earliest country followed by Germany. The present condition and the further problems of this institution will be discussed.

Elderly people’s road safety in Japan

MATSUURA, T. (Jissen Women’s University)

Older people aged 65 and over account for 45% of the road accident deaths in Japan, which is about twice as high as that of other industrialized countries. Fatal accidents for older people often occur when they are pedestrians and cyclists followed by drivers. We present a typical accident by older pedestrians (i.e., disregarding traffic signals) and by older drivers (i.e., failure to stop at the intersection). The reasons for the accidents are shown in terms of traffic environments and functional deficits of older people. Finally, some countermeasures for preventing road accidents and for accomplishing mobility of older people are introduced. They include new driver educational methods and efforts by local government for mobility of older citizens.

Keywords: older people, road accidents, traffic environment, mobility, Japan

The places where the percentage of the aged is very high: In the big city and the country
NAITO, T. (Shinshu University)

The percentage of the aged is high in Japan and the proportion of older people fluctuates between places. The places where approximately 50% or more of residents are more than 65 years old exist not only in farming, mountain and fishing villages, but also in urban areas. In general, the high ratio of the elderly causes economical and cultural declining in the community and difficulties for residents in their everyday life. The community of the highest ratio of the old disappears in the future. The main reasons of the high ratio of the aged are economy in the provinces, but administration in the cities. We report actual situations about places of the high percentage of the elderly in the big city and the country and success stories for activating the places.

Keywords: elderly, community, economy, residents, Japan

An anxiety of the nursing care of an aging society

YAGUCHI, K. (Tokai University)

Due to aging, illness and disabilities arise among the elderly. At present, a long-term hospitalization is difficult for older adults and special nursing homes for aged are fully occupied. When families are not able to maintain quality of care at home, elderly cannot remain with their families without any anxiety, even public-care insurance covers the cost of nursing home services. In Japan because of the number of older adults are growing so fast than the supply of medical and nursing support systems, most of the elderly are feeling anxious in many ways. In particular, the suicide rate of elderly females is the highest in advanced nations (G7). Although, they want to feel relieved by living with their families at home, they are depressed by their health problems and are more likely to be isolated. In such a sense, collapse of the family system seems to have a large impact on suicide rate of elderly females.

Mechanisms in the development and remediation of anxiety and novel interventions in anxiety disorders

Chair(s): CLARKE, P. (Brain and Mind Research Institute, University of Sydney)

This symposium combines researchers investigating the mechanisms of cognitive biases implicated in the development and maintenance of anxiety pathology with those examining new and innovative methods of treating of anxiety disorders. Recent advances in cognitive technologies have permitted significant progress in understanding the nature of cognitive biases of individuals vulnerable to anxious mood. The first and second speakers in this symposium report on the use of novel methodologies to examine cognitive biases in individuals with anxiety disorders, and how the pattern of both cognitive and physiological markers of anxiety change over the course of treatment. They highlight how these new paradigms inform understanding of the development, maintenance, and remediation of cognitive biases in anxiety. The second and third speakers in the symposium then discuss the use of novel cost-effective interventions for anxiety disorders. Both highlight how innovative combinations of traditional therapy approaches with new technologies and medications can potentially enhance service delivery and treatment outcomes to clients suffering anxiety disorders.

Distinguishing the attentional basis of positive and negative affectivity

GRAFTON, B. (University of Western Australia)

It is now well established that individuals suffering from clinical anxiety and depression display an attentional bias that operates to favour the processing of emotionally negative information (c.f. Mathews & MacLeod, 2005). However, some variations in the patterns of
attentional selectivity associated with these disorders are suggested. A possible explanation for this common, yet distinctive, pattern of attentional selectivity may lie in the differing contributions made by positive affectivity (PA), and negative affectivity (NA), to these disorders (e.g. Clark & Watson, 1991). That is, if distinctive patterns of attentional selectivity underpin these dimensions of affectivity, then the nature of the attentional biases observed in these disorders will have both common and distinctive features. Therefore, we investigated the patterns of attentional selectivity that characterise PA and NA in a manner that tested two alternative hypotheses: (1) content hypothesis: the differences in attentional selectivity associated with PA and NA reflect the types of material for which attentional bias is evidenced (e.g. positive vs. negative material); and (2) mechanism hypothesis: the differences in attentional selectivity associated with PA and NA reflect differences in the mechanisms that underpin the patterns of attentional selectivity (e.g. biased attentional engagement vs. disengagement). We employed a novel variant of the Attentional Probe task (MacLeod, Mathews & Tata, 1986) that introduced two sequential stages into every trial, requiring participants to first allocate their attention to an initial location, and, subsequently, move their attention to a second location. The task was rendered sensitive to the assessment of biased attentional engagement vs. disengagement, with differing classes of emotional information, through the systematic manipulation of the emotional valence of material (e.g. positive vs. negative) in the attended loci. The results provide support for both hypotheses; specifically, the patterns of attentional selectivity associated with PA differ from those associated with NA, in terms of both the content of the stimulus materials, and attentional mechanisms, implicated in these biases. The potential capacity of these findings to inform our understanding of emotional dysfunction, and the ways in which this new understanding can be therapeutically exploited within cognitive training regimes, will be discussed.

**Keywords:** anxiety, depression, attentional bias, negative affectivity, positive affectivity

**Establishing attentional and physiological indicators of treatment response and maintenance of gains in individuals undergoing CBT for Social Anxiety Disorder**

CLARKE, P. (Brain and Mind Research Institute, University of Sydney)

Theoretical models and empirical research strongly implicate the role of selective attention to threatening information and physiological arousal in the development and maintenance of Social Anxiety Disorder (SAD). However, relatively little research has been focused on the relationship between attentional and physiological mechanisms and the recovery from social anxiety. The present research assessed changes in selective attention for threat, and physiological measures including cortisol and startle response, in individuals completing a group based cognitive behavioural therapy (CBT) program for SAD. The key aim of this research was to establish which of these measures provide stable indicators of anxiety vulnerability, which respond to treatment and those that are predictive of relapse. Measure of existing attentional bias, and the ease with which a threat bias can be experimentally evoked, were obtained using a modified attentional probe task and a novel eye-tracking paradigm prior to, and following the completion of an 8 week CBT program. Salivary cortisol and startle response were also taken both prior to the commencement of therapy and at the completion of therapy. Preliminary results obtained from this research concerning the degree of change in attentional and physiological measures, the capacity of these measures to predict treatment outcome and the stability of treatment gains will be described in detail. The implications of these findings for theoretical models of SAD are discussed in addition to the potential applied value in identifying those individuals most likely to respond to treatment and the utility of including measures of selective attention and physiological arousal as predictors of potential treatment gains.

**Keywords:** selective attention, threatening information, physiological arousal, social anxiety disorder, cognitive behavioural therapy
**D-Cycloserine as an adjunct to Cognitive-Behaviour Therapy to enhance treatment outcomes for Social Anxiety Disorder**

GUASTELLA, A. (Brain and Mind Research Institute, University of Sydney)

Recent advances in the neurobiology of fear-extinction have led to the development of novel medications that are believed to enhance learning for overcoming fear during exposure based techniques. This research has shown that one of these medications, a simple antibiotic d-Cycloserine, enhances treatment outcomes for exposure therapy when used as an adjunct to treat social anxiety disorder. It is yet to be determined, however, whether d-Cycloserine facilitates more comprehensive treatment programs for social anxiety disorder, such as Cognitive-Behaviour Therapy. 60 social anxiety patients have been assigned to receive DCS or a placebo immediately before the exposure based components of Cognitive-Behaviour Therapy. Participants were treated with this medication and a group-based cognitive behaviour therapy treatment package. Participants also completed pre, post and long-term follow-up diagnostic and self-report assessments for social anxiety disorder. Results available at the time of presentation will be presented demonstrating the effect of d-Cycloserine on Cognitive-Behaviour Therapy treatment outcomes for Social Anxiety Disorder. Results will be discussed in relation to the development of a brief, safe, and effective adjunctive treatment to improve the quality and effectiveness of Cognitive-Behaviour Therapy for Social Anxiety Disorder. There will also be some discussion of mechanisms of action and patient matching.

**Keywords:** fear-extinction, d-Cycloserine, exposure therapy, social anxiety disorder, cognitive behavioural therapy

**Can Generalised Anxiety Disorder be treated using e-health interventions?**

EAGLESTON, C. (Brain and Mind Research Institute, University of Sydney)

However, very little is known about the effectiveness of web-based interventions for Generalised Anxiety Disorder. In a clinical setting, their effectiveness needs to be evaluated against gold standard interventions such as the administration of antidepressant medication, and against credible control conditions. The current trial aims to compare the effectiveness of a web-based program (e-couch), the use of sertraline, and an attention control placebo condition. Community referred young adults, 18-30 years old, who meet clinical diagnosis for GAD are involved in a 10-week intervention comparing the effectiveness of online cognitive behavioural therapy (CBT) with the antidepressant sertraline and an attention control placebo (Health Watch website). Individuals in all groups will receive matched contact with health professionals and general practitioners. Preliminary results describing changes in symptoms and rates of GAD diagnosis will be reported as a function of group membership. The findings will be discussed with respect to models of the delivery of early intervention services, the practicality of services using web methods, and the use of both traditional and non-traditional models in stepped care and clinic practices.

**Keywords:** web-based interventions, generalised anxiety disorder, sertraline, cognitive behavioural therapy, group membership
Men and vulnerability: Cultural and societal expectations about weakness and strength

Chair(s): CRONAN, K. (Professional Consulting and Counselling Centre)
Discussant(s): CRONAN, K. (Professional Consulting and Counselling Centre)

Despite decades of government sponsored health promotion campaigns highlighting gender as a key determinant of health, men suffer poorer outcomes on almost every measure of health status in comparison to women. The dominant gender role expectation for Western men typically dictates rigid and constricting notions of stoicism, toughness, and fear of self-disclosure. Such expectations contribute to a prevailing avoidance of vulnerability which entails long term psychosocial consequences for men - inhibiting the formation of intimate relationships with other males, and significantly contributing to delayed help seeking for physical or emotional complaints. Five papers are presented in this symposium exploring the clinical and cultural implications of men’s intolerance of vulnerability. The first paper declares a reconceptualisation of homophobia as a fear of emotional vulnerability between men, and calls for a new research agenda to understand the emotional impoverishment inherent in many men’s relationships due to unhealthy expressions of masculinity. An empirical paper then explores men’s vulnerability to socially prescribed body image pressures and its impacts, considering the roles of sexuality and homophobia. Next, research is presented on men’s adherence to traditional gender role ideals, and the relationship between transgressions of such ideals and harmful alcohol consumption. Following this, a review paper will synthesise recent findings on violence and abuse directed toward men by female perpetrators, considering men’s disadvantage in emotional literacy, and social and professional support systems. Finally, empirical data will be presented on atypical depressive symptom presentation in a sample of male truck drivers, exploring issues in the assessment of depression for men who avoid both self-disclosure and vulnerability. Attendees can expect to gain an understanding of current issues in research related to the psychology of men within the clinical context. Presentations will draw on the impact of socialisation processes and gender role expectations in fostering the avoidance of vulnerability and the interaction of masculinity with perceived and actual societal expectations. Presenters will give special attention to issues related to clinical assessment and intervention, and recommendations for future research and policy.

Reconceptualising homophobia as a fear of emotional vulnerability between men

MCKELLEY, R. (University of Wisconsin-La Crosse)

Although the construct of homophobia is widely used in research literature and clinical practice, there remains great variation in its meanings and outcomes. One of the modern conventions suggests the term “homophobia” refers to a fear relating to homosexuality, particularly men’s fear of intimate or sexual relations with each other. Interestingly, relevant literature about other cultures does not report similar attitudes to this modern Western phenomenon. For example, touch among men in some Asian, Arabic, African, and Islander cultures does not imply the same taboo attitudes. However, conceptualising homophobia as a fear of sexual contact with men limits its therapeutic usefulness. Instead, the construct is more useful if broadly considered as a general fear of emotional vulnerability between men. We will explore the genesis of this emotional impoverishment of masculinity and the impact it has on several dimensions of male development and relationships. Selected case material from individual and group therapy with men spanning over 30 years of clinical work in Australia and the United States will be presented. Particular focus will be on links between fear of emotional vulnerability with other men, early cultural and familial prohibitions against such vulnerability, and implications on men’s relationships and psychosocial development. Finally, clinical guidelines to help clients overcome fears of
vulnerability are included. Men in many Western cultures experience an emotional impoverishment that stems from culturally formulated inhibitions around gender, often beginning in infancy and perpetuated by families and societies. These culturally formulated inhibitions on emotional intimacy influence most males throughout their lives in terms of their emotional growth and their ability to experience freedom in tenderness, vulnerability, and depth of friendship as well as relationships, both heterosexual and homosexual. The culturally derived fear of close male relationships, reinforced by cultural attitudes in their lifespan, can leave Western men – and maybe men of other cultures – with unfulfilling relationships if left unchallenged. Reconceptualising homophobia as a deep and pervasive fear of intimacy with men has the potential to help focus the desired therapeutic change needed to help male clients develop richer and more fulfilling relationships and personal lives.

Keywords: homophobia, homosexuality, Western cultures, emotional vulnerability, masculinity

Men’s body image experiences: What are the roles of sexuality and homophobia?

GREENTREE, S. (PsychSessions)

Body image has long been considered a female issue, with men thought to be free from the appearance pressures women have faced for decades. However, it is ever more apparent that this same pressure is now being felt by men; to achieve the perceived body beautiful. Few studies have directly compared gay and straight men in relation to body image, or considered the impact of homophobia. This study aimed to compare gay and straight men in relation to body image measures designed specifically for men, and explore the role of homophobia and internalised homophobia. Participants (110 straight men, 72 gay men) were recruited from undergraduate psychology courses and from a range of community groups. They were required to complete a questionnaire measuring masculine body ideal distress, drive for muscularity, objectified body consciousness, reasons for exercise, attitudes toward homosexuality and internalised homophobia (homosexual men only). It was found that gay and straight men did not significantly differ on any of the body image measures and there were no significant relationships between the body image measures with the homophobia/internalised homophobia measures. For all participants, levels of masculine body ideal distress were predicted by objectified body consciousness factors and exercising to improve health and fitness; and levels of drive for muscularity were predicted by exercising for health and fitness reasons only. The overall findings suggest, as has been found with women, that men are vulnerable to the pressures of the media and society at large in the development of an idealised male body type, and specifically, some men will experience distress when this ideal is not met. It also indicates that the experiences of gay and straight men may not significantly differ. However, it cannot be said that these two groups are the same, and it is possible that there are different explanations for why the two groups experience masculine body ideal distress and drive for muscularity. Further research is required to explore these possible differences to increase our understanding and inform the development of education and intervention programs.

Keywords: body image, sexuality, homophobia, idealised male body type, masculinity

Real men drink alcohol: The endorsement of traditional masculinity as a contributing factor in men’s alcohol misuse

CUTHBERT, S. (Australian Catholic University)

Alcohol is the most widely used and misused drug in Australia. Consuming alcohol has long been regarded as a functional pattern of behaviour that contributes to social cohesiveness and bonding. General population surveys show that men abstain less often, drink more alcohol, are less mindful of recommended daily limits for consumption, and cause more problems by their drinking. Aspects of traditional masculinity are an often cited consideration in explaining men’s alcohol misuse. This study examined dimensions of the traditional male gender role, as explicated by Pleck’s Gender Role Strain Paradigm, and their
relationship to forms of excessive drinking, for Australian males aged eighteen to fifty-nine years. 343 men completed an online questionnaire that included measures of alcohol misuse, masculine ideology, and masculine gender role stress. Outcomes showed that greater endorsement of masculine ideology, or one’s cognitive belief-set about what represents appropriate masculine behaviour, predicted more binge drinking, higher hazardous consumption, and greater symptoms of alcohol dependence. Increased gender role stress, or the cognitive appraisal of transgressions of traditional male gender role norms as stressful or threatening, predicted greater harmful alcohol use. A significant interaction effect was also found, whereby greater gender role stress predicted more harmful use, and symptoms of dependence, as a function of higher masculine ideology. In addition, differences in the male gender role variables, and the patterns of excessive drinking were found between two age groups: young adult men, and adult men. When compared to older males, young adult men more readily endorsed masculine ideology, appraised deviations from of masculine-typed responses as more stressful, and reported more excessive drinking across all forms of alcohol misuse. Results suggest that beliefs about what represents appropriate masculine behaviour and departures from this behavior experienced as stressful influence both the risky consumption of alcohol, and more entrenched forms of drinking. These findings have implications for the development of prevention programming, and possible targets of intervention for alcohol misuse treatments, aimed more generally at men, but particularly at younger men.

Keywords: alcohol use, traditional masculinity, male gender role, excessive drinking, cognitive belief-set

Emotional and physical violence toward male victims by female perpetrators – let’s open the door

CELI, E. (Elements Integrated Health Consulting)

The aim of this literature review is to raise awareness on the prevalence, and understanding toward the context, of intimate partner violence (IPV). Specifically, this study focused on domestic abuse and domestic violence toward male victims by female perpetrators. Additionally, the question of how effective we are at detecting and counseling male victims of domestic abuse or violence by female perpetrators is explored. A review of key literature and literature reviews often quoted when addressing the issue of male victims will be summarised and key issues to be considered by psychologists will be highlighted for future consideration. The alarming frequency and severity of IPV, specifically abuse toward male victims by female partners, challenges the perceptions of men and society alike. That is, “men are tough; surely he’s stronger and has more power over her”. Our own Australian Bureau of Statistics (2005) indicates that near one in three (29.8%) victims of current partner violence since the age of 15 is male. Men experience domestic abuse differently, particularly when one considers they may be at a disadvantage in their emotional literacy, social support and professional support compared to women. Research methodology may not appropriately capture the experience of male victims, with limited accessibility of male victims for research. Combine this with male victims’ experience of shame, helplessness and re-victimisation within social and/or health paradigms, male victims face similar barriers to safely speaking up about their experience. Current social paradigms, educational training, health and legal services are ineffective in addressing the contextual issues surrounding male victims of domestic abuse by female perpetrators. At ‘best’, male victims are unrecognised and/or unsupported and at ‘worst’ they may be inadvertently re-victimised by health, police and legal services. Commencing discussion on this silent phenomenon of male victims aims to increase awareness and understanding of how men experience abuse and/or violence by female perpetrators. Considerations in research methodology and the social influences impacting on men’s health will be highlighted.

Keywords: domestic violence, male victims, female perpetrators, intimate partner violence, social support
When the wheels fall off: Atypical depressive symptom presentation in male truck drivers

RICE, S. (Australian Catholic University)

Traditional male role expectations typically pressure men to adhere to norms emphasising stoicism, self-reliance, and the avoidance of emotional vulnerability. Such norms may interfere with the psychological health of men by impeding help seeking and altering symptom presentation for emotional disorders such as depression. Qualitative studies have repeatedly demonstrated that men frequently exhibit an alternate constellation of atypical, externalising symptoms when depressed. One explanation for this is that atypical symptoms such as anger, aggression and substance abuse are consistent with traditional male role expectations. In exploring this, the current study sought to investigate retrospective depressive symptom presentation in a sample of stereotypically masculine men within the trucking industry. Self-report data was collected from 91 Australian male truck drivers. Questionnaires were completed on-site at a truck depot prior to a morning shift. Respondents completed scales assessing prototypic and atypical symptoms of depression. Questionnaire items were complete for the last time respondents recalled feeling really ‘down in the dumps’ – a DSM-IV descriptor for depression. Total scores for prototypic and atypical symptoms were moderately correlated. Clinical categories mapping on to DSM-IV diagnostic criteria were generated. Based on the self-report scores, 22% of the sample met diagnostic criteria for a Major Depressive Episode for the retrospective period for which they were reporting. Contrary to prediction, individuals within the clinical group on average reported the co-occurrence of three times the number of atypical symptoms compared to those in the non-clinical group. Atypical symptoms most frequently endorsed by those in the clinical group included irritability, frustration, self-reliance, alcohol use and outward aggression. Atypical behaviors least endorsed by respondents were gambling, self-harm, drug use. Results indicate that atypical depressive symptoms were associated with underlying psychological distress, and that prototypic and atypical symptoms were likely to co-occur. Further, results indicate that assessment of atypical depressive symptoms may provide valuable clinical information. Assessing atypical depressive symptoms may be particularly useful in cases where men adhere to traditional male role norms, but may be unlikely to admit prototypic symptoms that infer emotional vulnerability.

Keywords: depression, male truck drivers, male gender role, alcohol use, emotional vulnerability
Mental health problems in people looking for employment or already working: Theoretical models tested in different contexts

Chair(s): CORBIÈRE, M. (University of Sherbrooke)

Mental health problems and their consequences represent a large human and financial burden; approximately one-quarter of the world’s population will be directly affected by such problems at some stage in their lives. In most industrialized countries, vocational success for people with mental health problems represents the cornerstone of their recovery. However, for people with severe mental disorders (e.g., schizophrenia) who obtain employment, job tenure is often brief: from 3 to 7 months. For people with transitory mental health problems (e.g., adjustment disorders), work absences often represent more than 40% of all salary insurance claims, regardless of the country. The literature contains few theoretical models explaining the detection of mental health problems in people already in the labour market, or the vocational successes of those with mental disorders looking for employment. As such, the symposia will describe people with severe or transitory mental health problems integrating into the workplace or already working via diverse theories relevant to the contexts, such as the job demand-control-support model (Karasek), the effort/reward imbalance model (Siegrist), the Self-determination theory (Deci, 2004), job search models (Sacks; Schwab) and the theory of planned behavior (Ajzen, 1988, 1991). The main learning objective is to offer a better understanding of the key conceptual elements involved in the field of mental health and the workplace.

Psychological distress among government employees: a mixed approach

DURAND, M. (University of Sherbrooke), COUTU, M. (University of Sherbrooke), LEMIEUX, P. (University of Sherbrooke)

Mental disorders are among the main causes of short- and long-term disability. In order to address this issue, a better understanding of the level of distress and associated factors is needed. The aims are to describe the level of distress in employees working in a provincial governmental agency and to identify the main work disability factors associated with the level of distress. A web survey was conducted with all employees of the governmental agency. The variables assessed were based on the models of imbalance effort-reward, job demand, self-determination, work-family conflict and self-esteem. The survey’s qualitative approaches using focus groups and an ergonomic analysis (diary) of the mental load after a working day documented the main work disability factors. The response rate was of 52% and respondents’ characteristics were representative of the Agency. The level of distress found among respondents (n = 2368) was significantly higher than the general Quebec population. The main disability factors associated with distress included the relationship with the supervisor, the need for acknowledgement, work motivation and work-family conflict. From the 11 focus groups (n=86) and 193 diaries, factors explaining the results from the survey included: rapid organizational changes and lack of control over these changes, the perception of inconsistencies between performance criteria and the agency’s mission, and lack of acknowledgement of the complexity of the job. Based on these results preventive strategies and interventions on individual and organizational levels are suggested. For example, the goal of an individual intervention is to address psychological distress in employees as soon as possible, with strategies that make sense for employees, such as modifying performance criteria to acknowledge the complexity of the job. For an organizational intervention, the approach is to offer to supervisors a higher level of decision-making and to give them tools to detect depressive symptoms in their employees.

Keywords: mental disorders, disability, distress, motivation, work-family conflict
The motivation to keep working of people with mental disorders employed in Social Enterprises

FRACCAROLI, F. (University of Trento), ZANIBONI, S. (University of Trento), VILLOTTI, P. (University of Trento)

Social Enterprises were originally developed in Italy in the 1980s as innovative firms to help disadvantaged people with the work integration process, e.g., individuals with mental disorders. The approach of Social Enterprises to the work integration process corresponds to the Place-then-Train approach, placing the person in real work situations prior to offering specific training. One of the principal goals of this on-the-job training approach is to improve both social and professional abilities in order to guide disadvantaged people to be fully productive workers and, thus, facilitate the creation of job opportunities. This study explores a model of the motivation to keep working (a key construct of the work integration process) for people with mental disorders employed in Social Enterprises. Based on results from previous studies, specific variables from the model were taken into consideration: personal and clinical characteristics (e.g., severity of the psychiatric symptoms, occupational self efficacy), and environmental characteristics (e.g., work accommodation, social support). 164 individuals with mental disorders employed in Social Enterprises located in Italy filled out a battery of questionnaires to assess clinical, personal and work related variables. Of these, 62.7% were men. The average age of all participants was 41 years ($SD = 8.38$). Path analyses with LISREL 8.7 were used to test the hypothesized model. The model tested showed good fit indices $\chi^2 = (21, N=164) = 8.14, p = .99; \chi^2/df = .39; RMSEA = .00; NNFI = 1.00; CFI = 1.00)$. All paths were significant and followed the hypothesized directions. Our data supports the hypothesized model. The model showed that different variables (i.e., personal, clinical, and environmental) must be taken into consideration to understand the motivation to keep working for people with mental disorders employed in Social Enterprises. This issue is important because of the implications for vocational interventions to improve the work integration process for this targeted population.

Keywords: social enterprises, mental disorders, Place-then-Train approach, disadvantaged people, environmental factors

Job search behavior (JSB) dimensions: A research on people with mental illness

GILLES, P. (University of Aix en Provence), MOLINIER WEINSTEIN, N. (University of Aix en Provence)

The purpose of this study is to examine the dimensions of job search behavior (JSB) and their predictive validity concerning job interviews and job status for people with mental illness. Although some research has investigated a composite job search index (Kopelman, Rovenpor, & Millsap, 1992) or job search categories (e.g. Blau, 1994), there is no consensus about the number and nature of the dimensions. Data were collected from 200 participants with mental illness (mood, psychotic, anxiety or personality disorders) looking for employment. JSB inventory was measured using a 13-item behavior scale (Perron et al., 2006) based on previous measures of job search behavior. Participants contacted by telephone indicated whether they had carried out each behavioral item on a dichotomic scale (yes/no) in the previous 9 months. They also reported whether they obtained job interviews (yes/no) and employment (status and quality). Participants carried out a mean of 6 job search behaviors ($SD = 3$). The range of intercorrelation items was from .06 to .59. Three categories were extracted from a hierarchical ascendant analysis: preparatory (e.g., “researching information about job search strategies”), active (e.g., “telephoned a prospective employer”), and distal network (e.g., “spoke with previous employers”). The prediction of job interviews was higher for active JSB than preparatory JSB (22% vs. 3% of the variance). Job status was predicted by active JSB only (6% of variance). These results are consistent with Blau’s (preparatory vs. active, 1994) and Granovetter’s (weak ties, 1994) studies. Since we found implications between the three categories (preparatory => active => distal network), this description of JSB is better than...
using a global index to evaluate the type and the level of engagement people have in their JSB. Another interest is that JSB categories predict job search success differently. Developing this research avenue will be useful in improving coaching for job search seekers with mental illness.

Keywords: job search behaviour, predictive validity, job interviews, mental illness, employment

Work integration of people with severe mental illness registered in supported employment programs: A conceptual model

CORBIÈRE, M. (University of Sherbrooke), LECOMTE, T. (University of Montreal)

Vocational outcomes of people with severe mental illness registered in supported employment programs can vary greatly from one individual to the next. Investigators have, consequently, tried to identify the individual characteristics that could best predict obtaining employment in such programs. To date, there is a paucity of information regarding how psychosocial factors such as self-esteem or self-efficacy influence the work integration process of people with severe mental disorders, or how these factors interact with perceptions of barriers to employment, for instance, to explain obtaining competitive employment. The purpose of the study is to develop, from the literature (based on the Theory of Planned Behaviour), and to test, a model of work integration for people with severe mental disorders participating in supported employment programs. Data were collected from 281 people with severe mental disorders registered in supported employment programs located in Canada. The longitudinal study consisted of two phases. At the time of the participants’ entry into the program, the data gathered from participants included several dimensions (i.e., background, psychosocial, work-related, and clinical variables). At the nine-month follow-up telephone interview, all participants were asked to describe their vocational path. Path analyses with LISREL 8.7 were used to test the hypotheses regarding the conceptual model adapted to the work integration of people with severe mental disorders. Based on the Theory of Planned Behaviour, the model integrated significant variables (e.g., self-esteem, perceived barriers to employment, motivation to obtain employment) to predict work integration. The modified model showed acceptable fit indices ($\chi^2 = (60, N = 281) = 75.52, p = .08; \chi^2/df = 1.26; \text{RMSEA} = .03; \text{NNFI} = .99; \text{CFI} = .99; \text{IFI} = .99$). The development of such a model is needed in order to better understand the combination of individual factors explaining the work integration of this population (e.g., negative self-esteem significantly predicts perceived barriers to employment, which, in turn, predicts motivation to obtain employment) and consequently to offer appropriate vocational or clinical interventions, as well as to develop new research avenues in the vocational rehabilitation field.

Keywords: mental illness, self-esteem, self-efficacy, employment, supported employment programs
Mental health recovery after the 2004 Tsunami in Thailand

Chair(s): ROMANO, J. (University of Minnesota)
Discussant(s): JOHN ROMANO, J. (University of Minnesota)

The December 26, 2004 Asian tsunami was a natural disaster of historic portion. The massive earthquake traveled across 14 countries, killing about 230,000 people. Thousands of people were injured, 1.7 million people became homeless, and it is estimated that the tsunami caused $10 billion dollars in damage. Thailand was one of the countries that experienced much loss of life and damage across several seaside provinces noted for their fishing and tourism industries. In Thailand over 8,000 people were killed. The objective of this symposium is to report on four research studies that focus on mental health recovery of Thai people affected by the tsunami. The research began shortly after the tsunami and continues to this day. The research team includes Thai psychology and nursing faculty as well as a U.S. psychologist. Members of the research team participated in the mental health recovery efforts immediately after the tsunami, and have revisited the affected area for consultation with local partners and data collection. The studies focus on several aspects of development and well-being of Thai students and adults affected by the tsunami, from elementary school children through elder citizens. Data were also gathered from teachers and family members of tsunami affected youth. Collectively, the four research studies report on data gathered from approximately 1,100 individuals. Three of the studies used quantitative methods and one study used qualitative methods. The studies report on several variables across the different sample groups including: needs of tsunami affected youth and adults, impact of the tsunami on youth and their teachers and family members, developmental differences between children affected and not affected by the tsunami, behavior problems and family functioning of adolescent survivors, and the impact and physical and psychological health of elders coping with the disaster. The papers address the importance of sustaining psychological and physical well-being of tsunami survivors’ years after the disaster as survivors continue to mourn their losses. The papers will add to the research literature on the psychological impact of natural disasters and suggest how mental health professionals and disaster relief workers can sustain long-term recovery efforts after the immediate crisis ends.

Sustainable mental rehabilitation and collaboration: Psychological rebuilding for children, adolescents, families and teachers in the Tsunami aftermath

SIRIVUNNAPOO, P. (Chulalongkorn University)

This study was constructed to propose the sustainable mental rehabilitation and collaborative psychological rebuilding for children, adolescents, families, and teachers. Three phases of the long term research plan are: Phase 1, conduct a needs assessment of children, adolescents, families and teachers; Phase 2, examine the effects of the tsunami on children, adolescents, families and teachers; Phase 3, propose a rehabilitation center to implement and monitor community outreach and support for children, adolescents, families and teachers. Participants were 880 individuals affected by the 2004 tsunami in Phang Nga province, Thailand. There were 240 elementary and 240 secondary school students, 200 family members, and 200 teachers. Survey forms focusing on need assessment and psychological impact of the tsunami were administrated. Findings revealed as follows: Phase 1 (Needs Assessment). While the children group reported the highest score on the need for a new family for the orphans from the 2004 tsunami, the adolescents group reported the highest score on the need for scholarships for further education. For the teacher group, the need for sustainable rehabilitation of psychological rebuilding was the most wanted need. Phase 2 (Impact of the Tsunami). Results showed that the children aged 5-12 years who were exposed to the tsunami demonstrated lower physical and cognitive abilities compared to those who were not expose to the tsunami. However, only the tsunami affected children aged 11-12 years
experienced high scores on emotional difficulties when compared to those who were not exposed to the tsunami. With regard to the tsunami-affected adolescents, adolescents with high numbers of tsunami experiences were more likely to develop emotional and behavioral problems than those who had no or little experiences. In addition, both teachers and families who had high scores on the number of tsunami experiences demonstrated unhappiness and poor physical and mental health. Phase 3 (Proposed Rehabilitation Center). In this phase, the research team plans to implement the project results from Phase 1 and 2. A model for sustainable mental health rehabilitation and collaborative psychological rebuilding across the community will be discussed.

Keywords: sustainable mental rehabilitation, tsunami, cognitive abilities, adolescents, natural disasters

Impact of the 2004 tsunami disaster on the physical, cognitive, and emotional development of children in Phang Nga Province, Thailand

RITHAKANANONE, P. (Chulalongkorn University)

A comparison study was carried out to measure the physical, cognitive, and emotional development of school children who lived in the 2004 tsunami affected and non-affected areas in Phang Nga Province, Thailand. A total of 414 school children in grades 1-6 were measured, 192 from one non-tsunami affected school, and 222 from two tsunami-affected schools. Data were collected in 2007 (children in grade 1 were about 2 years old and 6th grade children were about 5 years old at the time of the tsunami). Children’s weight and height were compared with the norm of Thai children of the same age and sex. It was found that boys in the 1st, 2nd, 3rd, and 5th grades and girls in the 1st and 2nd grades from the tsunami-affected schools were significantly shorter than normal Thai children. The study also showed that boys in the 1st and 5th grades and girls in the 2nd grade from the tsunami-affected schools had significantly lower weight than the norm. However, the weight and height of children from the non-tsunami affected school were either not different or significantly higher than the norm. A measure of children’s cognitive ability comprised of numerical, spatial, addition and subtraction, analogical and comparative abilities was administered to the children. The study showed that the 5th and 6th grade children from the tsunami-affected schools had significantly lower cognitive ability than children of the same grade whose school was unaffected by the tsunami, especially, on numerical, spatial, addition and subtraction, and analogical abilities. Children’s emotional development was measured by using a 4-point pictorial rating scale by which children were asked to rate their mood in various situations. Results showed that the 5th grade children from the tsunami-affected schools had significantly poorer mood than children of the same grade whose school was unaffected by the tsunami. The study also revealed that girls from the tsunami-affected schools had significantly poorer mood than their counterpart whose school was not affected by the tsunami. Discussion on the impact of the 2004 Tsunami disaster on the development of these children and intervention programs for school and family will be presented.

Keywords: tsunami, development, children, Thailand, cognitive ability

The impact, religious practices, family functioning, and well-being on behavior problems of Thai adolescent survivors after the 2004 tsunami

TUICOMEPEE, A. (Chulalongkorn University)

Youth behavior problems (e.g. disobedience, difficulty concentrating, increased aggression, irritation, somatic complaints, fear, and depression) are some of the mental health concerns following a devastating disaster. It has been noted that the psychological impact, including behavior problems of disaster survivors, remains for many years later. This study examines behavior problems of adolescent tsunami survivors at about 4.5 years after the 2004 tsunami. Other related variables such as youth tsunami experiences, religious practices, family functioning, and adolescents’ well-being were also measured. Participants were 240 adolescents in grades 7-12 at two public tsunami affected schools in
Phang Nga province, Thailand. Their mean age was 14.6 (SD =1.86, range 12-19) years. Data collection used self-report measures: Objective Tsunami Experiences Index, General Functioning Scale, Religious Practices Index, Oxford Happiness Inventory, and the Thai Version of Youth Self-Report. The reliabilities of the measures as assessed through either Cronbach’s alpha coefficient or the Kuder-Richardson 20 coefficients varied from .50 to .94. Path analysis revealed that the adolescents’ tsunami experiences (e.g. saw much destruction of building, vehicles and boats, saw people severely injured or dead bodies, lost house and other personal property, lost one or more relatives, lost family members, lost one or both parents) directly related to the adolescents’ well-being and indirectly related to the number of reported behavior problems. The adolescents with high numbers of tsunami experiences, who less engaged in religious practices, had poor family function, and were less happy demonstrated behavior problems. The path analysis lends insight into the disaster’s impact on youth survivors’ adjustment. Positive family functioning and increased religious practices may contribute to feelings of personal happiness and decrease the impact of the disaster experiences, especially related to youth behavioral problems. Ways to reduce the impact of natural disasters on youth survivors will be discussed.

Keywords: tsunami, religious practice, family functioning, well-being, adolescents

From psychological problems to self-care behaviors: Late life tsunami survivors 4 years after the tsunami

SOONTHORNCHAIYA, R. (Chulalongkorn University)

Although Thailand rapidly received assistance and successfully implemented relief efforts, the mental trauma of the disaster was still embedded in elders who experienced the disaster. Four years after the tsunami, elders in this study who experienced the disaster were still affected psychologically, and their health status and living situation were also affected. Although Thailand rapidly received assistance and success in relief response, the mental trauma still embedded within individuals who experienced this stressful life event. The purpose of this qualitative study was to collect data about the psychological problems, coping methods, and self-care behaviors of older adult survivors of the 2004 tsunami. Participants were 22 adults, aged between 60-81 years old (no dementia), who had direct experiences with various losses from the 2004 tsunami. Semi-structured in-depth interviews, audio-tape recorders, and field notes were used to collect and record data at participants’ home. Data were collected about four years after the tsunami. Thematic analysis was use to discover regularities and patterns among descriptions. Four major themes emerged: 1) Stressful mental trauma was still embed in participant minds, especially suffering from missing beloved persons; 2) concerns focused on educational scholarships for their children, and continuous care for themselves; 3) coping with stress included reframing thoughts as “plong”, living with life understanding, doing activities for healing, receiving support from family members, and building self-esteem; 4) living with self-care included seeking and continuing physical and mental health care from professionals as necessary, and holding onto Buddhist religious principles. The findings delineated that the tsunami was a very stressful life event that has had prolonged affects on the elders’ lives. Older adult survivors continue to suffer from their losses and remain concerned about their children’s lives. Although participants found ways to cope with the stress of the disaster and to live more wisely, survivors needed professional help for continuous physical and mental health care. Findings suggest that health care professionals continue follow-up care with older adult disaster survivors, and encourage self-care such as the development of coping strategies with enhanced religious practices.

Keywords: psychological problems, self-care, tsunami, Thailand, mental trauma
Mental illness and policing

Chair(s): THOMAS, S. (Centre for Forensic Behavioural Science, Monash University)
Discussant(s): DICKINSON, A. (Victoria Police)

Police have frequent contact with people experiencing mental illness; however, little is actually known about actual contact rates, precursors, processes, interventions and outcomes of these interactions. This symposium will present key findings arising from Project PRIMeD, a 5-year collaborative program of research with Victoria Police, funded by the Australian Research Council from 2007 - 2011. The key learning objectives are: (1) how often do police come into contact with the mentally ill? (2) do outcomes of contacts with the mentally ill differ from those with the non-mentally ill? (3) what types of offences and patterns of offending bring the police into contact with the mentally ill? And (4) what the gaps are in police knowledge, training, service integration and delivery?

Criminal offending, victimisation and the schizophrenias

SHORT, T. (Centre for Forensic Behavioural Science, Monash University)

Despite the widespread incidence of crime amongst mentally ill populations, relatively little research has focused on the relationship between offending, victimization and the schizophrenias. The available research shows that persons with schizophrenia are more likely to experience and perpetrate violent crime, and represent a vulnerable population in the community. Factors that increase and decrease the risk of violence need to be reliably identified, with a view towards creating effective policing procedures to manage the risks posed to and by those with severe mental illness. This presentation will report on a study that explored patterns of violence, victimization and offending in a large sample of people diagnosed with schizophrenia in Victoria, Australia between 1975 and 2005.

Changes in patterns and types of crimes and victimisation rates will be compared across this time period, which encompasses the major mental health reforms associated with deinstitutionalization.

Keywords: crime, schizophrenia, victimization, violence, policing procedures

Police contact with people experiencing mental illness: Prevalence and challenges

THOMAS, S. (Centre for Forensic Behavioural Science, Monash University)

Despite anecdotal evidence suggesting the commonality of contacts between the police and people experiencing mental illness, very little evidence exists that has actually sought to quantify this or understand police perspectives on this. Against this background we carried out a series of research studies to investigate these questions. Studies included a study of psychiatric symptoms in police cells; the needs and diagnoses of detainees in police cells; and a large survey of operational police members documenting their estimates of the rates and types of contacts they had with people experiencing mental illness along with their attitudes and views on the biggest challenges they faced at this interface. This presentation will report on key findings arising from these studies. The discussion focussing on the need for police training and for functional interagency collaborations.

Keywords: police, mental illness, police training

The roll-out and functioning of the Mental Health Transfer Form: Early findings and implications for community policing

LUEBBERS, S. (Centre for Forensic Behavioural Science, Monash University)

In the course of their duties the police frequently come into contact with people experiencing mental illness. These encounters can lead to considerable time commitments for attending police members, especially when the person requires an assessment at an Emergency Department. The aim of the study was to document the circumstances surrounding police contacts with people
Abstracts of the 27th International Congress of Applied Psychology

experiencing mental illness by reviewing contact data routinely recorded by police members across the State. The Mental Health Transfer Form has recently been rolled out by Victoria Police and seeks to document the frequency and types of contacts between police and people experiencing mental illness. All police members are required to complete this form on every occasion when they came into contact with a person experiencing mental illness. Early data on its introduction to routine police practice across the State will be presented. This presentation will focus on describing the reasons for police involvement in these encounters, where the person was transported to, response times of services requested, and the initial outcomes of the police involvement. Additionally, by considering the time that the police members estimate they have taken on these encounters, the financial cost associated with these encounters and activities ensuing will be estimated. Implications for service providers will be discussed in light of these findings.

Keywords: police, mental illness, Mental Health Transfer Form, Victoria Police

In-depth examination of coronial reports following the fatal use of force by the police

KESIC, D. (Centre for Forensic Behavioural Science, Monash University)

Routine encounters between the police and members of the community can sometimes result in the police needing to use fatal force in order to resolve the critical incident. This research investigated the Coronial Reports of all persons that the police fatally wounded between 1982 and 2007 in Victoria, Australia (n=48). The aim of the study was to examine the patterns and commonalities in the fatal incidents, the following variables were studied: background of the decedents, including the presence of any mental illness; antecedents to the incidents; behavioural presentation of decedents, including being affected by substances; operational decisions made, and other types of force used prior to fatal force being used. The discussion will focus on furthering our understanding of fatal incidents involving persons who are experiencing mental illness and practical tools to help guide the development of more policy and practice developments for police and mental health service providers at this interface.

Keywords: police, Coronial Reports, fatal incidents, mental illness
Minding the Gap: A critical examination of the historical, current and potential engagement of psychology and psychologists in fostering (or impeding) the social and emotional wellbeing and mental health of Indigenous peoples

Chair(s): GRIDLEY, H. (Australian Psychological Society)
Discussant(s): DUDGEON, P. (Australian Indigenous Psychologists Association)

The aim of this symposium is to examine the role of psychological science and practice in contributing to, maintaining and potentially narrowing the current gap in social and emotional wellbeing and mental health outcomes between Indigenous and non-Indigenous peoples. Taken together, these three papers invite psychologists to consider the impacts of their science and practice in the lives of Indigenous people, with a particular focus on the mental health and wellbeing of Aboriginal and Torres Strait Islander Australians. The learning objectives of this symposium are: to review the policy context of Aboriginal and Torres Strait Islander mental health and wellbeing; to encourage reflective process in psychological research and practice with Indigenous peoples; to learn about the key determinants of Aboriginal and Torres Strait Islander mental health and wellbeing; to consider ways of addressing the current gap in SEWB and health outcomes between Indigenous and non-Indigenous Australians; to consider the process, outcomes and lessons learned from a project designed to identify innovative models and resources to increase Aboriginal and Torres Strait Islander mental health awareness and encourage help-seeking. Questions that need to be asked of any research initiative, policy or intervention include: Who is expected to change? Does it materially improve the lives of Indigenous people? How many? Which communities? Is psychology part of the problem or part of the solutions? How can we tell?

The policy context of Aboriginal and Torres Strait Islander mental health

KELLY, K. (Australian Indigenous Psychologists Association), WALKER, R. (Telethon Institute for Child Health Research)

This paper focuses on the national policies and reports that specifically address Indigenous social and emotional wellbeing and mental health issues, together with the relevant reports and commissioned inquiries that have influenced these policies. It outlines the key national policies, frameworks and reports, including the specific aims of key policies or reports; why they were developed and by whom; what they intended to achieve; and whether any programs or services were implemented and/or any practices or processes were influenced. Policy development and implementation can be a piecemeal and at times ad hoc ‘action-response- action’ process to address a perceived issue or need. Changes in policies tend to be underpinned by assumptions regarding the policy process and the reasons for success or failure in implementing policies or programs. This paper describes the historical and social context of colonisation and how successive policies have impacted on Indigenous social and emotional wellbeing.

Keywords: mental health, Indigenous, emotional well-being, policy development, colonisation

Living on the edge: Social determinants of indigenous Australian mental health and well being

This paper explores the determinants of Indigenous social and emotional wellbeing (SEWB), and provides a range of recommendations for addressing the current gap in SEWB and health outcomes between Indigenous and non-Indigenous Australians. Part 1 introduces current definitions of the social determinants of health, together with understandings of Indigenous mental health and SEWB. Part 2 draws on a range of national health survey reports to examine the high levels of non-specific psychological distress reported by Indigenous Australians. Serious psychological distress can be considered to be one type of global indicator of poor social and emotional wellbeing. It appears to be an independent predictor of, and part of the causal pathway that leads to, physical illness and mortality risk, with documented associations to reduced life expectancy, premature mortality, greater incidence and prevalence of disease, increased behavioural risk factors for ill health, and lower overall health status. In addition to risk factors, the paper also identifies a number of important strengths or protective factors, such as social cohesion, a sense of positive wellbeing and resilience and connection to land, culture, spirituality and ancestry. Part 3 discusses the lack of culturally appropriate services available to meet the social and emotional needs of Indigenous Australians and the need to develop resources to promote SEWB and prevent serious psychological distress. The paper concludes that modifying the social determinants that lead to serious psychological distress should result in a range of beneficial outcomes and contribute to closing the gap in life expectancy between Indigenous and other Australians. Measuring and monitoring levels of psychological distress might also help to move Indigenous social and emotional wellbeing from a descriptive construct toward an explanatory framework. Further development of SEWB measures and culturally competent SEWB programs will help to close the gap between the health of Indigenous and non-Indigenous Australians. Increasing our capacity to target risk and protective factors and prevent serious psychological distress among Indigenous Australians should be key priorities. The paper concludes with a number of recommendations to progress the development of the Indigenous SEWB field and the prevention of serious psychological distress.

Keywords: Indigenous, emotional well-being, psychological distress, risk factors, resilience

The Indigenous mental health awareness and help-seeking project

Improved Indigenous mental health outcomes will not be achieved unless mental health services can successfully engage with Aboriginal and Torres Strait Islander peoples and communities. This paper provides an overview of a project designed to identify innovative models and resources to increase mental health awareness and encourage help-seeking in urban, regional and remote Indigenous communities. A working party of Aboriginal and Torres Strait Islander psychologists was formed to oversee the project. The project involved a service access mapping exercise, an environmental scan and a comprehensive review of 46 innovative services in remote, rural and urban settings across the country. The working party developed criteria to assess each innovation against the identified needs of Indigenous people. The environmental scan showed restricted access to social and emotional and primary mental health care for Indigenous communities, particularly in remote communities. Different lessons emerged from the reviews of Indigenous-led and non-Indigenous innovations. Community engagement was more likely if service providers could quickly demonstrate cultural relevance to the communities they were servicing. The findings highlighted the importance of viewing awareness-raising of mental health issues as more than a stand-alone activity, particularly if there is restricted access or an absence of services to respond to any help-seeking which may occur. Recommended outcomes of the project included the establishment of a web-based resource that: exemplifies the critical elements of service models that increase mental health
awareness and help-seeking in Indigenous communities; identifies a set of core principles to guide the development of culturally safe, accessible services for Indigenous communities; increases policy makers’ understanding of innovative, best-practice models that work in Indigenous communities; and encourages greater recognition and awareness of best-practice models across a broad range of agencies working with Indigenous communities that contributes to local sustainability and broadening of their application.

Money management

Chair(s): KIRCHLER, E. (University of Vienna), ROLAND-LÉVY, C. (University of Reims)

Discussant(s): LEISER, D. (Ben Gurion University)

The symposium deals with applied psychological research on money management. In detail, the invited presentations focus on income distribution and emotional reactions related to income differences, on social representations of saving and credit, predictions of credit burden and evaluation of repayment plans as well as hindsight effects after successful credit payback, on socially responsible investment and the stock market, and tax behavior. Key learning objectives are demonstrating the variety of economic psychological topics in theory, method and application. In particular the focus of the symposium is on the interaction between emotional and cognitive dynamics in money management. In bringing together experts on different areas of money management, coming from different countries, the discussion should focus on common themes and potential cultural differences.

Envy and preferences for income distribution

KEMP, S. (University of Christchurch), BOLLE, F. (Europa-University Viadrina)

The first aim of this study was to see whether people’s preferences for income distributions relate to their tendency to envy other people. Secondly, to investigate whether some objects (e.g. wealth) are more likely to be envied than others (e.g. happiness). A series of three small-scale questionnaire studies have been used to date. All of these have employed samples of university students – chosen so as to make the lifestyles and thus potential objects of envy fairly similar. Respondents have read scenarios of societies with different happiness or income distributions and recorded their choices for living in them. They have also completed a standard scale of dispositional envy and been asked how much they would vary similar
others who enjoy different forms of success. The following results have emerged to date: (1) People’s propensity to envy is surprisingly well captured by their dispositional envy scores. As a first approximation, envious people envy almost any success or good fortune on the part of others; non-envious people envy very little. (2) There is a slight tendency for income and other objective measures to be envied more than happiness. (3) No measure of envy explains people’s choices for different happiness or income distributions within societies very well. This is not because people do not differ on these measures; they do, however, there is virtually no covariation. It is concluded that the desire that some people have to see more equal wealth or happiness within society is not greatly driven by envy.

Keywords: income, wealth, envy, society, happiness

Financial decision-making and social representations in the connection to financial crisis

ROLAND-LÉVY, C. (University of Reims)

Social representations of credit and savings were studied in the French population in winter 2009, in the context of the financial crisis in connection to financial decision-making. Even if social representations do not change easily, they can be affected by the general context in which social groups holding these social representations are. In the context of a financial and social crisis, it is hypothesized that the social representations of financial elements, e.g. taking credit and/or saving, will be different for those who feel that they are directly affected by the crisis compared to those who feel that the crisis does not or will not affect them personally. The links between social representations and financial decision-making (buying, taking credit, saving) are also approached. Two groups of French participants, aged 18 years and above, responded to a face-to-face questionnaire which required half of the participants to consider that they are affected by the crisis, while the other half of participants were not. Social representation was studied with free association tasks, along with a series of items measuring attitudes towards both the financial crisis and ways in which it is affecting the participants. Other free association tasks measure the social representation of credit and savings. Finally, a series of questions are devoted to financial planning and buying during the coming six months, as well as socio-demographic characteristics. The results show differences in the central nucleus and in some of the peripheral elements of the representation for each group (affected versus not affected). The differences imply dissimilarities in planned behavior and financial decision-making, especially in trying to get credit versus saving behavior. The results are discussed in comparison with those obtained in other studies carried out on the same topic in a context of no financial crisis versus financial crisis.

Keywords: financial crisis, social representations, decision making, financial planning, credit

Loan repayment as intertemporal sequence

HOELZL, E. (University of Vienna)

Repaying a loan can be both a financial and an emotional burden. For an informed decision about loan use, consumers would ideally be able to correctly predict how burdensome a loan will be and how this burden will develop over time. Institutions, on the other hand, could offer loan repayment plans that fit consumers’ needs. The present work combines research on affective forecasting and on intertemporal sequences in the domain of loan repayment. In Study One, a survey was conducted with 117 homeowners, grouped by duration of living in their loan-financed home. Participants reported their current experience of loan burden, and gave forecasts for the future. In Study Two, 105 participants were asked to imagine a situation where they consider a 10-year-loan for an apartment and could choose between loans with rates either falling or rising over time. In Study Three, 180 participants were asked to predict for the same scenario how they would feel about the loan in year one and in year 10. In Study One, results showed that participants in an early stage of repayment expect lower levels of loan burden in the future than experienced now; however,
Participants in later stages of repayment report equally high levels of experienced loan burden as the first group. In Study Two, the majority preferred falling rates over rising rates. In Study Three, results indicate differences in evaluation over time and confirm the preference for falling rates. Overall, the findings support a preference for improvement, i.e., loans with falling rates being preferred over loans with rising rates. This is also in line with the expectation that loan burden would decrease over time. Implications for the design of loan repayment plans are discussed.

Keywords: loan, loan repayment plans, consumers, intertemporal sequences, forecasting

Effects of short-term versus long-term rewards of socially responsible investments

GAERLING, T. (University of Gothenburg), ANDERSSON, M. (University of Gothenburg), HEDESSTRÖM, M. (University of Gothenburg), SUNDBLAD, E.-L. (University of Gothenburg)

Counteracting short-termism within the finance sector is believed to facilitate for companies to manage their practices in a way reconcilable to sustainable development. We aim to investigate whether changes in how portfolio managers are incentivised and monitored will make them more likely to favour stock companies with better environmental practices. Empirical evidence on the effects of prolonged monitoring intervals on investment decisions is largely lacking. In informal interviews with finance professionals, we map out the practices of incentivising portfolio managers within the Swedish fund management industry. This information will be used in designing experimental studies. Simulating choices faced by portfolio managers, participants (finances students at late stages of education) will make investment decisions under the assumption that taking environmental information into account will increase stock returns within a given time frame. Within that time frame, monitoring frequency and bonus size will be manipulated in order to investigate effects on investment decisions. It was found that the most common method to incentivise portfolio managers is by offering them a monetary bonus conditional on the fund performing better than its benchmark index. Performance-related bonuses are generally awarded annually. Interestingly, this applies not only to retail funds but also to insurance companies and pension funds with long-term time horizons for their investments. While bonuses in some cases are restricted to a maximum of two to four months’ wages, some organisations do not apply a ceiling for their bonus payments. For some types of funds, bonus systems also include a three-year component. Current incentive systems for portfolio managers make them manage investments towards short time frames within which better environmental performance is unlikely to materialise in financial returns. We will present experimental evidence showing under what circumstances changes in incentives will make portfolio managers more likely to favour stock companies with superior environmental practices.

Tax compliance decisions depending on fines and monetary incentives

KIRCHLER, E. (University of Vienna), KASTLUNGER, B. (University of Vienna)

Tax compliance is maintained by the threat of punishment for tax evasion. However, in tax compliance literature a positive approach to encourage tax compliance is often recommended. A few empirical studies addressed the effect of monetary rewards for increasing tax compliance. In the present study the effects of high versus low monetary rewards on tax paying decisions are studied. A laboratory experiment was conducted where 86 participants had to decide about paying their taxes in 60 tax filing rounds. In each round they received an income from which they decided to pay their taxes and they were informed about audit probability and fine rate. Participants were randomly assigned to one of the three experimental conditions. Beside the control condition, two rewards conditions were conducted, in which participants faced high versus low monetary rewards when audited and found to be compliant. Expected values between all three conditions were held
constant by varying fine rates for evasion. The results show that taxpayers in the high reward condition were more often compliant than those in the control condition. Furthermore, an immediate effect of rewards on tax compliance in the immediate following round was found. Taxpayers experiencing an audit and being rewarded for their compliance paid more taxes in the following round compared to audited compliant taxpayers that experienced no rewards. The results highlight the importance of a positive and reciprocal relationship between taxpayers and tax authorities. The results show that in addition to the pure monetary effect, rewards have a relational effect that is expressed in higher tax compliance immediately after experiencing a reward for their tax compliance.

Keywords: tax compliance, monetary rewards, audit, taxpayers, tax evasion

Motivational issues in sport:
Perfectionism, goals, moral functioning and engagement

Chair(s): HALL, H. K. (Norwegian University of Sports Science), ROBERTS, G. C. (Norwegian University of Sports Science)

The symposium attempts to bring together research on motivational dynamics that is underpinned by different forms of goal striving. The research presented is informed by contemporary theoretical approaches to achievement motivation, which highlights the importance of goal directed behaviour in understanding various psychological processes underpinning both adaptive and maladaptive achievement outcomes. In the last decade, the topic of perfectionism has generated significant research interest in social, educational and clinical psychology. During the same period, research into perfectionism in sport has emerged and this has begun to examine the influence of perfectionism on various psychological processes associated with sport performance. The findings from this research provide evidence that while all forms of perfectionism may energise achievement striving and lead to positive outcomes, perfectionism that reflects a self-critical style may contribute to psychological debilitation in athletes. The first paper in the symposium identifies how different forms of dispositional perfectionism are associated with distinct patterns of motivational goals, and how these differentially influence burnout in elite junior athletes. The second paper further examines the motivational dynamics of athlete burnout and examines what additional influence perfectionistic cognitions have upon athlete burnout, over and above the influence of dispositional forms of perfectionism. The third paper seeks to understand how perfectionism might be developed through social learning in elite junior athletes, and it examines the degree to which perfectionistic cognitions are influenced by the motivational climates which are perceived as being created by parents and
coaches. The fourth paper deals with the impact of the motivational climate on important outcome variables in sport: cheating behaviour, peer relationships and burn out. The motivational climate the coaches create is important in that a mastery motivational climate is positively associated with positive peer relationships, lower level of cheating, and a lesser likelihood of burning out! The fifth paper examines motivational processes from a longitudinal perspective, and demonstrates the adaptive influence of children’s task goals, measured during ski education, on perceptions of health and physical activity measured 6-12 years later.

The meditational influence of achievement goals on the relationship between perfectionism, and athlete burnout.

HALL, H. K. (York St John University), HILL, A. P. (York St John University), APPLETON, P. R. (University of Birmingham)

While perfectionistic goal striving may lead to positive performance outcomes, it is important that researchers look beyond performance effects and consider the wider impact of perfectionism on the psychological well-being of athletes. This is because evidence suggests that certain forms of dispositional perfectionism may foster patterns of achievement cognition, affect, and behaviour that may undermine the motivation and psychological well being of participants (Flett & Hewitt, 2005; Hall, 2006; Stoll, Pescheck & Otto, 2008) and thereby predispose athletes to burnout (Hill, Hall, Appleton and Kozub, 2008; LeMyre, Hall & Roberts, 2008). To date, however, no research has examined whether approach and avoidance forms of mastery and performance goals mediate the relationship between perfectionism and burnout. Understanding how specific patterns of achievement goals are evoked in perfectionistic athletes may help to pinpoint key psychological mechanisms that help to explain the onset of burnout in elite junior athletes. Therefore, the purpose of the present research was to examine whether approach and avoidance forms of mastery and performance goals mediated the relationships between perfectionism and athlete burnout. 107 male and 140 female (M age = 15.15 years, SD = 11.92 years) performance swimmers completed a multi-section questionnaire which included Flett and Hewitt’s (1991) Multidimensional Perfectionism Scale, Conroy et al’s (2003) 2 x 2 Achievement Goals Questionnaire (AGQ) and Raedekes and Smith’s (2001) Athlete Burnout Questionnaire (ABQ). Structural equation modeling indicated that socially prescribed perfectionism was positively associated with mastery and performance avoidance goals while self-oriented perfectionism was positively associated with mastery and performance approach goals as well as performance avoidance goals. Furthermore, mastery approach goals were negatively associated with athlete burnout while both mastery avoidance and performance approach goals were positively associated with burnout. The findings provide evidence that socially prescribed perfectionism is regulated by avoidance motives and that mastery avoidance is a key mediator between this form of perfectionism and burnout. The findings also indicate that mastery and performance approach goals mediate the relationship between self-oriented perfectionism and burnout, with mastery approach goals underpinning lower levels of burnout and performance approach goals contributing to higher levels of burnout.

Dispositional perfectionism, perfectionistic cognitions and athlete burnout

HILL, A. P. (York St John University), HALL, H. K. (York St John University), APPLETON, P. R. (University of Birmingham)

Sport psychologists have recently begun to examine athlete burnout in a systematic manner (e.g., Goodger, Gorely, Lavallee, & Harwood, 2007). Some research has focused on identifying motivational factors that render junior athletes vulnerable to the development of burnout (e.g., Lemyre, Hall, & Roberts, 2007). Perfectionism is one of a number of characteristics emerging as an important antecedent of this debilitating syndrome. Most research has examined the influence of...
perfectionism on athlete burnout at a dispositional level. However, the work of Flett and colleagues (Flett, Hewitt, Blankstein, & Gray, 1998) suggests that perfectionism can also be assessed as individual differences in the frequency of the experience of perfectionistic cognitions which have a larger state component. Outside sport, research suggests that perfectionistic cognitions are a significant predictor of psychological distress above trait perfectionism and may contribute to burnout in athletes by contributing to chronic stress. The purpose of this investigation was to (i) examine the relationship between perfectionistic cognitions and athlete burnout, and (ii) examine whether perfectionistic cognitions account for additional unique variance in burnout above that accounted for dispositional perfectionism. Two-hundred and two male athletes (age $M = 18.81$, $SD = 2.87$, range 16-24) were recruited from youth teams of professional and semi-professional rugby union clubs in the UK. They completed Hewitt and Flett’s (1991) Multidimensional Perfectionism Scale, Flett et al.’s (1998) Perfectionism Cognitions Inventory, and Raedeke and Smith’s (2001) Athlete Burnout Questionnaire at the start of a season. A series of hierarchical regression analyses revealed that the frequency of the experience of perfectionistic cognitions was a significant positive predictor of all symptoms of athlete burnout. In addition, perfectionistic cognitions also explained a further 3-4% of variance in symptoms of athlete burnout above that accounted for by dispositional perfectionism. The findings suggest that individual differences in the frequency of the experience of perfectionistic cognitions may be an important factor when considering junior athletes susceptibility to burnout. Perfectionistic cognitions should, therefore, be included in both future models of the relationship between perfectionism and athlete burnout, as well as invention strategies aimed at the prevention of the syndrome.

The influence of perceived parental and coach created climates on athlete’s perfectionistic cognitions.

APPLETON, P. R. (University of Birmingham), HALL, H. K. (York St John University), HILL, A. P. (York St John University)

Previous investigations have identified a range of parental factors that underpin children’s perfectionistic tendencies, including parents’ own perfectionism, psychological control, punitive parenting styles, achievement goals, and unrealistic expectations. While these findings support the conceptual model of perfectionism development (Flett et al., 2002), researchers should remain cognisant of the wider social context that exerts influence over children’s predisposition towards perfectionistic cognitions. The influence of a child’s social context was highlighted in Flett et al’s model, which includes an “environmental pressures” component. In the context of junior sport, such environmental pressures may extend to coaches, who have a significant and lasting influence on their athletes. To date, however, the role of the coach in the development of athletes’ perfectionism has received scant empirical attention. In an attempt to address this void in the perfectionism literature, the aim of the current study was to determine whether the coach-created climate predicted unique variance in athletes’ perfectionistic cognitions after controlling for the influence of the parent-initiated climate. 196 elite junior athletes completed the Parent-Initiated Motivational Climate Questionnaire-2 (White & Duda, 1993), the Perceived Motivational Climate in Sport Questionnaire-2 (Newton, Duda, & Yin, 2000), and the Perfectionistic Cognitions Inventory (Flett, Hewitt, Blankstein & Gray, 1998). A regression analysis was employed and partial support was achieved for the forwarded hypotheses. At step one, mother- and father-initiated worry-conducive climates predicted 8.3% of the variance in athletes’ perfectionistic cognitions after controlling for the parent-initiated climate. At step two, the coach-created climate predicted unique variance in athletes’ perfectionistic cognitions. The addition of the coach-created motivational climate at step two explained a further 10.6% of variance, bringing the total variance explained to 19%. At step two, significant predictors of athletes’ perfectionistic cognitions were limited to athletes’ perceptions of the coach-created mastery and performance climate. The current findings highlight the influence of a child’s wider social environment in the development of perfectionistic tendencies. In particular, this
study demonstrated that in the context of elite junior sport, athletes’ may exhibit perfectionistic thoughts as a function of the coach-created motivational climate.

Motivational outcomes in sport: The relationship of a performance and a mastery climate to cheating, peer relationships and burning out

ROBERTS, G. C (Norwegian University of Sport Science)

The most interesting aspect of the recent work in motivation with achievement goal theory has been the attention paid to important outcome variables, for example peer relationships, cheating, overtraining and burnout. The present study reports the evidence from three studies that has investigated the effect of the motivational climate on important outcome variables such as cheating, quality of peer interaction, and burning out. We used canonical correlations to determine the relationship of the motivational climate to these outcome variables. Meaningful functions emerged on the variables. The performance climate was meaningfully related to burning out, peer conflict, and to cheating in sport. The mastery climate was meaningfully related to positive friendship and social acceptance, to less cheating, and to a lower likelihood of burning out! The evidence is suggestive that the motivational climate created by the coach affects the quality of peer relationships, cheating behaviour, and burning out.

Keywords: motivation, achievement goal theory, Burnout, peer conflict, cheating

The relationship between achievement goals, physical activity, perceived health and quality of life 6 – 12 years after finishing specialized ski-sport secondary education

SORENSEN, M. (Norwegian University of Sport Science)

Specialised ski-sport education implies that the students follow an ordinary curriculum, but are able to spend more time on their sport, and receive qualified coaching. Most pupils also have to move away from home, and there are costs involved for the family. This period of life (between 15 – 19 years of age) is decisive for personal development, education, social networking, and, for some, their further involvement in sport. We therefore wanted to investigate what the choice of this type of education would contribute to the life of young people. Questionnaires were sent out to all pupils that finished their ski-sport secondary education in the years of 1995, 1998, and 2001. In total, 217 individuals completed the survey. The preliminary results indicated that those with a high task orientation stayed longer in their sport, had a more positive perception of their health, and spent more time on general physical activity than those with a high ego orientation.

Keywords: sport, ski-sport education, coaching, personal development, task orientation
Motivation-centered interventions in sport: Theory, research, and practice

Chair(s): DUDA, J. (The University of Birmingham)

The study of motivation comprises the major research focus within the larger field of sport psychology. Two frameworks which have laid the foundation for a large body of contemporary research on the determinants and consequences of motivational processes in sport are the achievement goal theories (Ames, 1991; Dweck, 1999; Elliot, 2008; Nicholls, 1989) and Self Determination Theory (Deci & Ryan, 1985; Ryan & Deci, 1980). These two social cognitive frameworks focus on the meaning and implications of goal directed behaviors, both for the quantity and quality of achievement striving in the setting of interest. They also place importance on the role of the social environment on motivation-related cognitions, affect and action. All four papers in this symposium tie into these theoretical groundings. They speak to the particular features and promise for evidence-based practice of interventions which pull together what is known about achievement goals, the motivational climate, autonomy supportive environments, basic need satisfaction, self determination and optimal functioning in sport. Links are made to how and why we might intervene, via motivation-centered interventions, to manage debilitating forms of perfectionism in athletes, promote young sport participants’ optimal functioning, influence the psychosocial development and health of children, and use sport as a forum for teaching life skills in at risk populations.

Intervening with athletes to manage debilitating forms of perfectionism

HALL, H. (York St John University)

In the last decade research into perfectionism in sport has begun to emerge (e.g. Appleton, Hall & Hill, 2009; Dunn, Gotwals & Dunn, 2005; Hall, 2006; Hill, Hall, Appleton & Kozub, 2008; Stoeber, Stoll, Pescheck & Otto, 2008). Considerable evidence suggests that while perfectionism may energise achievement striving, and lead to positive performance outcomes it also has the potential to lead to performance impairment and engender considerable psychological distress. Despite the emergence of empirical literature that has begun to examine factors which may either mediate or moderate the influence of perfectionism in sport, few authors have identified intervention strategies to prevent its maladaptive consequences. Clearly, the development of sound interventions that attempt to address the debilitating effects of perfectionism must focus upon those psychological mechanisms which have identified why striving for exceedingly high goals may have problematic consequences. Therefore, the purpose of this paper is to utilise current evidence from motivational theory to identify potential intervention strategies that will aid in the management of perfectionism with athletes. The paper will employ the tenets of achievement goal theory (Ames, 1992; Nicholls, 1989) to explain why manipulating the achievement climate to foster task involvement and reduce ego involvement will be effective in reducing a focus on failure avoidance, and contingent self-worth, thought to be key energizers of perfectionism (Hewitt & Flett, 1991). Evidence from work on athlete burnout (Hill et al, 2008) and the development of perfectionism in children (Appleton et al, 2009b) suggests that this strategy may also be effective in facilitating unconditional self-acceptance and alleviating perfectionistic cognitions. Potential interventions which focus on the achievement climate perceived to be created by parents, coaches and peers will also be examined as all these agents have been implicated in the development of perfectionism with young athletes (Appleton et al 2009b; Flett & Hewitt, 2002). Further suggestions for intervention will also be based upon the tenets of self-determination theory. This is because debilitating forms of perfectionism are considered to be underpinned by perceptions of external control over achievement outcomes. Therefore, strategies to facilitate
autonomy support may be particularly relevant in the management of perfectionism.

### Social factors and motivational mechanisms influencing optimal functioning in youth sport: Intervention directions

**BALAGUER, I. (University of Valencia)**

It has been proposed that organized sport is a powerful context holding implications for the psychosocial development and optimal functioning of young people. Whether such objectives are obtained is also assumed to be specifically a function of the motivational dynamics operating in the sport setting at hand. Based on the achievement goal frameworks (e.g., Ames, 1992; Nicholls, 1992) and Self Determination Theory (Deci & Ryan, 1985; Ryan & Deci, 2000), research has indicated that the degree to which the psychological environments created by coaches are more or less positive correspond to variability in the satisfaction of basic psychological needs, autonomous versus controlling motivation and well-being of young athletes. There is also theoretical and empirical guidance regarding the characteristics of the social environment that should be more adaptive for youth sport participants. Specifically, it would seem that a task-involving rather than ego-involving climate and autonomy supportive rather than controlling environment should promote the quality of children’s engagement in sport. In this presentation and pulling from the two theoretical frameworks, findings emanating from our research with young Spanish sport participants and related work will be reviewed. These studies have involved children at both the recreational and elite levels in both individual and team sport. I will then turn to the implications of this research for the design and evaluation of interventions aimed at fostering optimal functioning in youth sport.

### The PAPA Project: A theory-based intervention centred on the promotion of an empowering motivational climate for young European football players

**DUDA, J. (University of Birmingham)**

Within the presentation, I will describe the collaborators in, background to and focus of the European Commission FP7 funded PAPA project (Promoting Adolescent Physical Activity; www.projectpapa.org). This is a 4-year research project entailing the development, implementation and testing of a theoretically-grounded youth coach training program aimed at creating an empowering psychological environment (more specifically, a motivational climate that is task-involving and autonomy supportive) in the context of youth football. A key assumption undergirding the PAPA project is that youth sport program hold implications for public health. The intervention will be developed and piloted in the UK and then all materials will be translated for implementation in France, Greece, Norway and Spain. A large multi-site trial will follow involving over 80 teams (and their coaches) and more than 1200 boys and girls between the ages of 10-14 years in the 5 countries. At baseline, the end of the season as well as at the start of the following season, a number of outcomes will be assessed including children’s health behaviours (e.g., physical activity, substance use), motivation for sport participation, indicators of well-being (e.g., self esteem, enjoyment) and continued involvement in football. Comparisons between the coaches and players in the intervention arm and those coaches/players involved in the standard provision of youth football will also be made. Results stemming from the preliminary pilot work will also be shared.

### Combating HIV/AIDS in Sub-Saharan Africa: Introducing mastery motivational strategies in a life-skill intervention in a community based sport program

**ROBERTS, G. (Norwegian University of Sport Science)**

...
The research reported in this study investigated whether mastery motivational strategies could enhance the effectiveness of a life-skill intervention for HIV/AIDS education through sport. A quasi field experimental study was conducted in Tanzania with 764 at-risk children randomly grouped into two intervention groups and two control groups. The intervention groups received AIDS education using trained peer coaches in football in a community based sport program, with one group having peer coaches trained in specific mastery strategies. Children in the intervention groups all reported significantly greater HIV knowledge, and positive attitudes and safe-sex behavioural intentions than the control groups. The mastery motivational strategies reliably enhanced risk reduction for most of the behavioural intention variables (e.g., intended condom use). When we used canonical correlation analysis with the intervention groups, the analysis revealed meaningful relationships between the mastery motivational strategies and the behavioural intention variables. The life-skill intervention through sport for HIV risk reduction was effective, and mastery motivational strategies enhanced that effectiveness.

**Keywords:** motivational strategies, HIV/AIDS, sport, peer coaches, community based sport program

**Multicultural counseling competency: Research and training issues in the U.S**

Chair(s): SHEU, H. B. (Arizona State University)

The purpose of the symposium is to introduce the current status of the multicultural counseling and training literatures as well as the findings of three empirical studies conducted in the United States. With globalization and human migration, the populations in countries, such as Australia and the U.S., have become more and more diverse in terms of race/ethnicity and cultural backgrounds. This unstoppable trend suggests that the training of multiculturally competent practitioners play a crucial role in delivering effective mental health services to such diverse populations. The first presentation of this symposium will provide an overview of the multicultural counseling competency (MCC) model and its contributions to counselor training in the U.S. A rationale for the subsequent three empirical studies will also be offered. The second presentation focuses on results of a study that was designed to test a new multicultural training model for counseling graduate students. Based on social cognitive theory, this model consists of variables (e.g., multicultural counseling self-efficacy) hypothesized to predict intention of providing counseling to racially diverse clients. The third presentation describes the process of developing a novel instrument designed to tap the concept of MCC from the consumer’s (i.e., the clients’) perspective. Finally, the fourth presentation will introduce a study that explores seasoned counseling practitioners’ experiences of working with diverse populations. Together, the four presentations will provide the audience with a complete picture of multicultural training models and issues as well as empirical efforts on this topic in the U.S. Implications for cross-cultural validity of the training models and empirical evidence will also be discussed. The learning objectives of this symposium are: (1) Participants of the symposium will gain knowledge about the current status of the multicultural counseling and training literatures
in the U.S. (2) Participants will acquire understanding of empirical findings that support a new multicultural training model for counseling graduate students. (3) Participants will gain knowledge about how consumers (i.e., clients) perceive their counselors’ multicultural counseling competencies. (4) Participants will familiarize themselves with training issues faced by and experiences of mental health professionals who provide serves to racially diverse populations.

Multicultural counseling competency and training: A review of the literatures in the U.S.

SHEU, H. B. (Arizona State University)

The purpose of the presentation is to provide an overview of the literatures on multicultural counseling competency and training in the United States. Since the landmark call for action within the field of psychology to address the needs of the increasingly diverse population in the U.S. (Sue et al., 1981), researchers, educators, and clinicians have debated the scope and assessment of multicultural counseling competency as well as the best methods of implementing training. Traditional counselor training has been monocultural based on the majority group’s psychological experiences without consideration of how racial/cultural minorities may seek help and benefit from counseling in different ways (Sue, Ivey, & Pedersen, 1996). To facilitate the training of culturally competent mental health professionals, the model of Multicultural Counseling Competency (MCC) was proposed by a group of researchers (Sue, Arredondo, & McDavis, 1992) in the U.S. Specifically, the MCC model encompasses three characteristics of counselors’ awareness of their own cultural values, understanding of the worldviews of clients, and developing culturally appropriate interventions across three dimensions – knowledge, awareness, and skills. The MCC model has served as the cornerstone of graduate training in counseling-related disciplines. A general review of the multicultural counseling and training literatures in the U.S. will be conducted, which will serve as the foundation for discussion about the development of multicultural counseling competency, effective multicultural training models, and different training issues faced by graduate students in counseling-related programs and seasoned mental health professionals in the field. This review will also pave the way for the subsequent three empirical studies designed to explore topics related to multicultural counseling competency and training from diverse perspectives. In short, this presentation will summarize the current status of the multicultural counseling and training literatures in the U.S. Cross-cultural applicability of multicultural training models will also be discussed.

A training model for increasing counseling trainees’ intent to work with racially diverse populations

RIGALI-OILER, M. (Arizona State University)

Although Multicultural Counseling Competency has been discussed in the American literature for decades, empirically-supported and effective multicultural counseling training models have not yet been proposed. With the increasing diversification of the U.S. population, it is essential that students in counseling graduate programs are both competent and interested in working with racially diverse populations. In an effort to predict future decisions to work with racially diverse clients, a multicultural counseling training model, based on social cognitive theory, was proposed for the current study. Specifically, factors such as previous mastery experience (i.e., direct counseling hours with racially diverse clients), perceptions of multicultural environments, multicultural counseling self-efficacy, outcome expectations, and interests were used to forecast future choice goals of providing mental health services to racially diverse populations. Data was collected from 205 graduate students in counseling-related programs in the U.S. Among the participants, the majority was female (71%). The racial breakdown of the sample is similar to national demographics of counseling trainees in the U.S., which included 57% White American, 8% African American, 13% Asian American/Pacific Islander, 5% Latino/a
Abstracts of the 27th International Congress of Applied Psychology

American, 8% Multiethnic, 8% International, and 1% reported being in other racial groups. Findings of structural equation modeling techniques showed that the hypothesized model produced a good fit to the data. Specifically, previous direct contact hours with racially diverse clients were predictive of multicultural counseling self-efficacy. Self-efficacy and outcome expectations both produced significant paths to interests in multicultural counseling, which, in turn, was a predictor of future intent to counsel racially diverse clients. Also, the effect of participants’ perceptions of multicultural training environments on their intent to serve this population was mediated by multicultural counseling self-efficacy and interests. Results of the study provided initial evidence for the proposed multicultural counseling training model. Social cognitive variables, especially multicultural counseling self-efficacy and interests, may play a vital role in facilitating counseling trainees’ decision to serve racially diverse clients in the future. Implications for counselor training and caveats for applying this model to training programs in other cultures will be discussed.

Client perception of counselor multicultural counseling competencies and its relations to counseling outcomes

SHEU, H. B. (Arizona State University)

Counselor multicultural counseling competencies (MCC) have received much conceptual and empirical attention in the counseling literature. While measures have been developed to assess this construct from the counselor’s perspective, researchers have yet to study how clients may perceive their counselor’s MCC and how the perceptions may predict the clients’ counseling outcomes. The purpose of this presentation is to outline the process of developing the Client Perceptions of Counselor Multicultural Counseling Competencies Scale (CPCMCCS) in the U.S. We will examine clients’ perceptions of their counselor’s MCC and how such perceptions relate to client variables (e.g., positive/negative affect, ethnic identity) and counseling outcomes (e.g., client satisfaction). Different methods were utilized to develop the item pool for the CPCMCCS. Semi-structured interviews were conducted by a research team with four racially diverse clients about their cross-racial counseling experiences. The research team revised existing MCC measures that were developed from the counselor’s perspective and reviewed relevant literatures in the U.S. to generate additional items. Research team members also suggested items based their own clinical experiences. Items were then categorized by common themes and redundant items were eliminated. Based on this procedure, the CPCMCCS was hypothesized to include a general counseling component and a multicultural counseling component with five subcomponents: (1) client self-exploration and connection between culture and presenting issues, (2) cultural differences and conflicts between counselor and client, (3) culturally-appropriate goals and interventions, (4) culturally-relevant resources, and (5) counselor’s cultural knowledge and stereotypes. The 67-item CPCMCCS test version was then revised again according to feedback from another five racially diverse clients. A sample CPCMCCS item includes, “My counselor helps me set counseling goals that are consistent with my cultural values.” Participants are asked to rate the frequency and perceived helpfulness of each item (i.e., counselor behavior) on a 5-point scale. An online survey containing the CPCMCCS and measures on client variables and counseling outcomes has been developed. Data will be collected in Spring 2010 from 200 clients who have received counseling in the past six months. Results of the study and directions for training, practice, and research will be discussed at the conference.

Exploring predictors of multicultural counseling experiences of mental health practitioners

MEJIA, A. (Arizona State University)
Several theories have been developed to explain how American counselors can effectively work with racially/ethnically diverse communities (Sue, Arredondo, McDavis, & Roderick, 1992). Many of these theories have influenced multicultural counseling training in the United States (Helms, 1995). These perspectives have been primarily derived from the experiences of graduate students at the early stage of their training. Despite the multitude of investigations, limited information is available on how seasoned mental health professionals and advanced counselor trainees perceive their self-efficacy in delivering multicultural counseling services to racially diverse clients. Thus, the purpose of this presentation is to expand the research on multicultural training by incorporating the experiences of clinical practitioners and advanced trainees. This investigation is designed to examine the experiences and perceptions of professional helpers’ (i.e., psychologists, social workers, psychiatrists) and advanced counselor or psychology interns’ ability to deliver multicultural counseling in the U.S. Specifically, the study explores variables (i.e., previous training and clinical experiences, perceptions of multicultural environments, multicultural counseling self-efficacy, outcome expectations and interests) that are hypothesized to predict outcomes (i.e., intention of conducting multicultural counseling, job satisfaction) for practitioners and advanced trainees. Professional helpers will be recruited from community mental health agencies, hospitals, schools, counseling centers and professional list serves. An online survey consisting of measures on aforementioned predictors and outcomes is already developed, and data collection will be conducted in Spring 2010. Complete results of data analysis will be available by April 2010. It is anticipated that the findings will expand our understanding of how mental health professionals develop their interests in and intentions of providing services to racially diverse clients. Results of the study will also inform how we can better design continuous education programs for practitioners. Findings and directions for future research will be discussed in light of the development of multicultural counseling competence post graduate training.

Multi-level effects of motivation, emotion, and cognition on performance: Recent theoretical, empirical, and methodological advances

Chair(s): VUCKOVIC, A. (The University of Queensland)
Discussant(s): FISHER, C. (Bond University)

Researchers and practitioners alike recognise that performance is influenced by a combination of motivational, emotional, and cognitive factors (Seo, Barrett, & Bartunek, 2004). These intertwined processes are thought to fluctuate within individuals over time (Illes & Judge, 2005). However, research has traditionally examined these factors in isolation, and treated them as stable processes by using between-person and simple pre-post designs (Fried & Slowik, 2004). This disconnect between theory and methodology creates an ecological fallacy, the significance of which is underscored by recent research demonstrating that a misspecification of levels can lead to erroneous conclusions (e.g., Vancouver et al., 2001). This symposium presents the initial progress on a program of work designed to integrate the study of motivation, emotion and cognition. As such, our work advances prior research in three ways. First, our work recognises that motivation, emotion, and cognition can vary at multiple levels of analysis. Accordingly, we examined these factors repeatedly over time as well as between individuals. Second, our symposium as a whole takes an integrated approach to examining motivational, emotional, and cognitive determinants of performance. Third, the studies presented here harness the benefits of high experimental control and psychological fidelity via an Air Traffic Control (ATC) micro-world in order to enhance external validity (Highhouse, 2009). As such, results are expected to generalise to tasks that require skills such as dynamic decision-making, relative distance judgments, maintaining vigilance and situation awareness, tradeoffs between speed and accuracy, and high workload (Yeo, Sorbello, Koy, & Smillie, 2008). Presenter 1 will consider the cognitive strategies involved in an ATC task, and how perceptions of potential collisions change over time and affect performance. Presenter 2 will report a multi-level analysis of the structure of affect within the context of complex skill acquisition. Presenters 3 and 4 will present studies that integrate motivational, emotional, and/or cognitive factors in a medium-fidelity ATC task.

A cognitive perspective on Air Traffic Control (ATC) task performance

VUCKOVIC, A. (The University of Queensland)

A number of studies have examined the factors influencing Air Traffic Control (ATC) conflict detection performance (Law et al., 1993; Remington, Johnston, Ruthruff, Gold, & Romera, 2000; Stankovic & Raufaste, 2008). Most of these studies assessed accuracy and response time as a function of the geometry and timing of the conflict (Xu, 2003). Although this research tells us what information is required to perform the task, it does not explain how this information is processed (Xu & Rantanen, 2003). Research shows that controllers will use various cognitive strategies to minimise workload and achieve effective performance (Loft, Sanderson, Neal, & Mooij, 2007). This study aims to examine the dynamic decision making process and the role of strategy in conflict detection performance. Thirty-one first year psychology students participated in a highly-controlled, low-fidelity simulation of the ATC conflict detection task (Fothergill, Loft, & Neal, 2009). We used a fully-crossed within-subjects design. Participants were presented with a series of trials showing pairs of aircraft converging on a crossing point. Aircraft would either conflict or pass safely, converge on an acute or an obtuse angle, and would be shown at different time points in their trajectories. The participant’s task was to estimate the potential likelihood of a conflict between the aircraft. The measures of performance were conflict likelihood responses and response times. Two types of cognitive strategies were assessed including the Distance to Velocity ratio and the Cognitive
Motion Extrapolation. Performance outcomes were first examined as a function of the independent variables. The results showed a complex pattern of findings where conflict likelihood responses and response times changed over time. In order to make sense of these findings, a Dynamic Signal Detection Analysis (Balakrishnan, Busemeyer, MacDonald, & Lin, 2003) was performed. The results indicated that performance was the result of a dynamic decision making process that could be accounted for by a Distance to Velocity ratio strategy. These findings highlight the need to examine the dynamic processes responsible for conflict detection performance. These findings also stress the importance of assessing the controller’s strategy as a way to understand the cognitive process driving the controller’s decisions.

Keywords: air traffic control, performance, decision making, conflict, response times

Measuring emotions throughout skill acquisition: A multi-level analysis

GEE, P. (The University of Queensland)

Although affect is recognised as a determinant of performance, there is disagreement regarding its structure and measurement (Beal, Weiss, Barros, & MacDermid, 2005). Researchers agree that valence and activation are dimensions of affect (Yik, Russell, & Barrett, 1999). However, some form these into two bipolar dimensions (Barrett & Russell, 1998) whereas others form them into two unipolar dimensions (Watson & Clark, 1997). There have also been calls to align theory with measurement by examining within-person fluctuations in affect over time (Beal et al., 2005). This study examined the structure of affect at the within and between person levels of analysis in the context of complex skill acquisition. In parallel, we assessed the validity of a succinct bipolar measure of affect. A total of 59 university students completed eight five-minute trials of a simulated Air Traffic Control task. The UWIST Mood Adjective Checklist (Matthews, Jones, & Chamberlain, 1990) was presented on trials two, four, six, and eight; in addition to three newly developed single-item bipolar scales (tense arousal, energetic arousal, and hedonic tone). Preliminary analyses have been conducted via AMOS. A multi-level confirmatory factor analysis (see Muthen, 1994) was used to test unipolarity versus bipolarity via five models. At the within-person level, all models demonstrated reasonable fit, though some unipolar models had better fit than the bipolar models. The factor loadings and interfactor correlations also suggested unipolar response patterns. At the between-person level, the fit indices were less than ideal across all models. However, the factor loadings and interfactor correlations suggested bipolar response patterns. When simultaneously compared at the within- and between-person levels, the bipolar models had better fit than the unipolar models. These preliminary findings suggest that the structure of affect may differ across levels of analysis. A unipolar structure seemed most appropriate at the within-person level, whereas a bipolar structure emerged at the between-person level. Empirically, this is one of the first studies to conduct a multi-level analysis of affect. These findings have also raised theoretical and practical implications on how we should conceptualise and measure affect.

Keywords: affect, performance, skill acquisition, UWIST Mood Adjective Checklist, air traffic control task

The role of affect in goal setting and goal striving: A multi-level analysis

BALLARD, T. (The University of Queensland)

Affect influences motivation both directly and indirectly through cognitive activities such as goal setting. There is evidence to suggest that the direct influence of affect on motivation during goal striving may differ to the indirect effect through goal setting (Foo, Uy, & Baron, 2009; Ilies & Judge, 2005). Goal setting and goal striving represent different levels of analysis because, goal striving occurs within the context of a goal (Vancouver, 2005). However, previous research has failed to draw this distinction. The purpose of this study was to develop an integrated understanding of how affect influences cognitions, motivation and performance across levels of analysis. A total of 105 participants completed a medium fidelity conflict resolution task from the Air Traffic Control micro-world (Shayne Loft, Hill,
Neal, Humphreys, & Yeo, 2004) which required them to accept aircraft entering the sector and resolve conflicts. Participants completed ten 10-minute trials, setting a performance goal before each trial. Effort was measured five times within each trial along with the bipolar measures of tense arousal, energetic arousal and hedonic tone validated in the previous study. Multilevel modelling was used to examine the relationships between performance, affect and goal at the between-trial level of analysis and performance, affect and effort at the within-trial level. At both the within-trial and between-trial levels, performance was positively related to hedonic tone. The relationship between affect and subsequent goal and effort differed across levels of analysis. At the between-trial level, tense arousal was negatively related to subsequent goal. At the within-trial level, tense arousal and energetic arousal were both positively related to subsequent effort. These results suggest that the direct influence of affect on motivation during goal striving differs to the indirect influence of affect through goal setting. During goal setting, feelings of stress may lead an individual to set a goal that is easier to attain. However, during goal striving, these same feelings may signal that the individual needs to work harder. These findings highlight the need to consider the level of analysis at which motivational and cognitive processes operate before making predictions about the role that affect will play.

Keywords: affect, goal setting, motivation, cognition, performance

Self-efficacy, goals, effort and performance: An examination at two within-person levels of analysis

MCNAMARA, M. (The University of Western Australia)

Self-efficacy refers to cognitive judgements individuals make regarding their ability to perform a given task (Bandura, 1997). The present study integrates the self-efficacy and goal literatures within a motivational framework in an attempt to reconcile conflicting views surrounding the direction of self-efficacy effects on performance. As such, self-efficacy effects on performance were examined during the goal setting and goal striving phases of self-regulation. Measures of self-efficacy, goal level and effort were taken prior to ten, ten-minute trials of Air Traffic Control (ATC) simulation task to investigate relationships during the goal setting phase of self-regulation. Measures of goal confidence, effort and performance were taken multiple times within each trial to examine relationships during the goal striving phase of self-regulation. Participants were required to accept aircraft and detect and resolve conflicts by changing aircraft flight levels to ensure that minimum separation standards were not breached. Participants received penalty points for making errors – their aim was to avoid penalty points, and as such, the task represented an avoidance motivation context. Multilevel modelling indicated that self-efficacy was beneficially related to performance during the goal setting phase. An increase in self-efficacy from one trial to the next was associated with an increase in performance. Unexpectedly, goal level did not mediate this relationship. Also unexpectedly, self-efficacy had a negative indirect effect on performance during the goal setting phase of self-regulation via effort. An increase in self-efficacy from one trial to the next was associated with a decrease in effort, which in turn decreased performance. Inconsistent with predictions, there was a positive indirect relationship between goal confidence and performance during the goal striving phase via effort. An increase in goal confidence from one time-point to the next within a trial was associated with an increase in effort, which in turn increased performance. These results contribute to the debate between Social Cognitive Theory and Control Theory. For example, the results suggest that both positive and negative self-efficacy effects can occur simultaneously during this phase of self-regulation. These results underscore the importance of examining cognitive and motivational factors simultaneously in multilevel designs.

Keywords: self-efficacy, air traffic control task, performance, goal setting, goal setting
National granted researchers on young adults, success SME entrepreneurs and employee's attributional styles and behaviours

Chair(s): UNGPRA, N. (Thammasart University), PAVAKANUN, U. (Thammasart University)
Discussant(s): GORSANAN, S. (Thammasart University)

The five research issues in attribution and behaviors were funded by the national foundations and related agents in Thailand and Poland. As for the topic related to male’s and female’s mass media gratification, the research was conducted in Poland. In Thailand, the topics related to students, were conducted on sexual behaviors, love styles, risky sexual behavior, learning methods, and learning achievement. For Thai adults, one research focused on attributional styles of SME Accommodation Entrepreneurs to which affected business success. The other study was related to psychological traits of employees in the Sufficiency Economy Management Organization.

Gender differences in mass media gratification

ROWIŃSKI, R. (Cardinal Stefan Wyszyński University in Warsaw)

According to mass communication statistics it has occurred that there are gender differences in mass media use. The impact of gender is different, and, in almost all cases, women have lesser access to and use of the media. If ICT and telecommunication were gender-neutral, affecting men and women equitably, then special attention to women would not be necessary. As they are not, such special attention is needed. But there is interesting how mass media gratify special needs according to gender. This issue could be important to understand these differences between women and men. On the basis of U&G Theory from Katz, Blumer and Gurevitch's perspective, (1974) there was an attempt to answer the question whether mass media differ from one another in the ability to gratify personal and social needs. Mass media employ common reasons for media use comprising four fundamental categories by McQuail (2001): information, personal identity, integration and social interaction, entertainment. Moreover, explorations concerned determining the position of the Internet in aspect of functional alternative for traditional media, as well as non-media gratification sources. Data included 500 participants (50% women) who with “paper-pencil” and online method fulfilled the survey forms of the Media Gratification Force (average Cronbach’s alpha coefficient for: press - 0,85; book - 0,87; cinema movies - 0,85; radio - 0,90; TV - 0,91; Internet - 0,89; non-media gratification - 0,91). According to McQuails classification mass media by source can gratify four needs. Results showed that need of integration and social interaction distinguished women and men (statistically significant) for all mass media, without non-media gratification. Also we have observed than entertainment, information and personal identity for some media are statistically significant for gender. Depended-related statistics have been provided (repeated measurement analysis within mass media gratification and between by gender). It is occurred that interaction effects (type of needs x gender) are also statistically significant. During discussion we try to explain how gender and mass media gratification have got impact on mass media use, especially in scope of telecommunications' statistic.

Keywords: gender differences, mass media gratification, personal identity, integration, social interaction

The study of love styles, sex roles, and sexual risk behaviors of undergraduate Thai students in Bangkok

TIEMTANOM, C. (Thammasart University)

Love and sexual behaviors among adolescents have increasingly become critical and brought
social and health problems in Thailand. However, few studies have investigated the relationship between these behaviors, especially in undergraduate students. Thus, the two main objectives of this study were to 1) compare the sexual risk behaviors of the undergraduate Thai students who differ in love styles and sexual roles 2) identify the relationships and the predictors of the sexual risk behaviors by love styles, sexual roles and close friend behaviors. The study combined both quantitative (A survey using LAS (C. Hendrick and S. Hendrick, 1990, TSRI modified from Bem sex role inventory, 1974 and SRBQ) and qualitative methodologies (in-depth interviewed). The sample consisted of 1,093 Thai undergraduate students in Bangkok, separated in 2 groups (having sexual experience \( n = 490 \); heterosexual males = 254, females = 147, homosexual = 40, and never having sexual experience \( n = 603 \); heterosexual males = 144, females = 328, homosexual = 14). The results of the study showed that the students who reported themselves never having sexual experience indicated an interaction between love styles and sexual roles on sexual risk behaviors, but not found in the other group. Moreover, love styles, sexual roles and close friend behaviors altogether predicted sexual risk behaviors in both groups of the students. Sexual experience is shown the important influence to the other factors. Sexual risk behavior is to be able to predict by love styles, sexual roles and close friend behaviors.

Keywords: adolescents, sexual risk behaviour, love styles, sexual roles, close relationships

Learning methods affecting learning achievement of undergraduates at King Mongkut's Institute of Technology North Bangkok

BOOTSASKRI, P. (King Mongkut's Institute of Technology North Bangkok)

The aim of the current study was to compare the learning methods toward learning achievement; personal characteristics toward learning achievement; and self-efficacy toward learning achievement. The subjects were 181 undergraduates enrolled in Human Relations course in the first semester of the academic year 2006. The subjects were assigned purposively to two experimental groups (each has 83 and 30 students respectively) and a control group (68 students). The research instruments were questionnaires collecting personal data, former learning achievement test, self-efficacy scales (alpha coefficient = .7477) and learning achievement test score. The t-test and one-way Analysis of Variance were used in data analysis. The findings were as follows: 1. the learning achievement scores of students tested after each session and one week before midterm and final examinations were significantly higher than the other groups at the .05 level; 2. the learning achievement scores of female students were significantly higher than that of male students at the .05 level; 3. the learning achievement scores of students in different majors were significantly different at the .05 level; 4. the learning achievement scores of students in different educational backgrounds were significantly different at the .05 level; 5. the learning achievement scores of students in different levels of self-efficacy were significantly different at the .05 level; 6. attendance in each session had no effect on learning achievement. Female yield the higher scores than male do. Most of the findings satisfied the hypothesis, except the attendant.

Keywords: learning methods, learning achievement, personal characteristics, self-efficacy, gender differences

Attributions and relationships of entrepreneurial orientation, human capital, and business success of SME accommodation entrepreneurs in successful provinces of tourism Thailand

PAVAKANUN, U. (Thammasart University)

The purposes are to study the attributions and the relationships of Entrepreneurial Orientation, Human Capital, and success of Entrepreneurs and to develop the prediction equation to entrepreneurial success by such factors. Subjects are 535 SME Accommodation Entrepreneurs the most successful provinces from six parts. The measurement instruments are individual structured interviews and questionnaires. Statistical analysis tools include frequency, percentage, mean, standard
deviation, Pearson’s Coefficient of Correlation and Stepwise multiple regression analysis. The study found that the majority of subjects are 34-44 year-old Bangkokers with equal proportion of both sex. Most subjects are entrepreneurs in accommodation business. Most of them were ex-employees and have been running their own business since 1997 (Most), 1992 (some), 1986 (some), with starting investment of more than 1 million bath. The inspiration of career came from relatives’ business success. More than 31 employees worked in an organization that sets short-plans for every position. No more than 50 hours per week is the average working hours of an entrepreneur. With regard to Entrepreneurial Orientation, it is found that the entrepreneurs have autonomy, need for achievement, and stability and learning at a considerably high level while risk taking, innovativeness, and competitive aggressiveness are at a medium level. With regard to human capital, it is found that most of the entrepreneurs hold Bachelor’s Degree. Nevertheless, they have skills and experience in management at a considerably medium level. The entrepreneurs are generally successful at a high level, following by medium level. Surprisingly, few entrepreneurs have achieves, their success at a low level. With regard to the relationship of entrepreneurial orientation, human capital, and Success, the style of Entrepreneurial Orientation in Autonomy, Innovativeness, stability and Learning, and achievement, and human capital in management and career skills have all positively correlated with success. The predicting equation shows that innovativeness, achievement, autonomy, of entrepreneurial orientation, and experience in management could predict success at 8.8%, with the error of 6.4247. Business success can be influenced by the entrepreneurial orientation, and the human capital.

Keywords: attribution, entrepreneurial orientation, human capital, entrepreneurial success, risk taking

The effect of the sufficiency economy on the psychological trait of the employee in the sufficiency economy management organization

KHUMBUNARAK, T. (Human Resource Institute, Thammasart University)

The purpose of this research is to present the role and concept of the sufficiency economy in Thai society and the application of this concept to organizations. Furthermore, this research will also study psychological traits and make comparison between personnel who work in sufficiency economy organizations and organizations which are managed by other concepts. The samples used are from 400 personnel employed by organizations which have embraced the sufficiency economy concept as well as other organizations that do not rely upon the sufficiency economy system. For 93.8% of the samples were obtained by 375 questionnaires distributed to these companies. Personnel who work in the sufficiency economy concept organizations apply the concept at individual and organizational levels more than personnel who work in non-sufficiency economy organizations. Personnel who work in the sufficiency economy concept organizations apply the sufficiency economy concept to rational factors, immunity factors and overall sufficiency economy factors more than personnel who work in non-sufficiency economy organizations. Personnel who work in the sufficiency economy concept organizations had less future oriented – self control, self efficacy psychological traits than personnel who work in other organizations. There were positive relationships between future oriented – self control and individual levels of sufficiency economy, abstinence, immunity and overall sufficiency economy. Self efficacy associated positively with individual levels of sufficiency economy, abstinence and overall sufficiency economy. Moreover, there were positive relationships between rational and immunity. There were negative relationships between Machiavellian personality and organizational level of sufficiency economy, abstinence and overall sufficiency economy. Furthermore, there were correlations with individual levels of sufficiency economy and rational. Internal locus of control correlated positively with all factors of sufficiency economy. There were positive relationships between ethical rationalization that related to these factors of sufficiency economy: organizational level of sufficiency
Abstracts of the 27th International Congress of Applied Psychology

**Natural products as cognitive enhancers**

Chair(s): SCHOLEY, A. (NICM Centre for Neurocognition, Brain Sciences Institute, Swinburne University)

Pharmacological approaches to cognition enhancement have important ramifications for the discipline of psychology. The area has clinical applications in the field of dementia and other conditions where cognition is fragile either due to direct pathological change or secondary effects of, for example, fatigue or stress. Furthermore, there is increasing interest in the notion that cognition may be enhanced even in cognitively intact individuals. This symposium will draw on leading international experts in the field of natural medicines and behaviour. It will take an evidence-based approach to natural medicines and cognitive enhancement. The symposium will firstly set out the theoretical reasons for using a polypharmacological approach to cognitive enhancement. Material will be presented challenging whether current therapeutic strategies for Alzheimer’s disease are adequate and will then systematically review promising evidence for plant-based therapies in the context of dementia. Further talks will focus on one specific herbal extract – Bacopa monniera – to illustrate the range of methodologies which have been used to assess the cognitive enhancing properties of this plant. Finally, the challenges which arise when developing standardized natural products for behavioural outcomes will be explained. Key learning objectives include: an understanding of the nature of cognition enhancement; knowledge of theoretical issues surrounding human cognitive function in the context of its enhancement; an understanding of the issues and challenges surrounding effective treatment for cognitive decline; knowledge of the range of methodologies used to assess potential cognitive enhancers and anti-stress agents; and an understanding of the challenges involved in development of cognitively active natural medicines.

---

**Key terms:** sufficiency economy, psychological traits, self-control, self-efficacy, internal locus of control

---

economy, abstinence, rational, immunity and overall sufficiency economy. All factors of sufficiency economy had a positive correlation with overall psychological traits. Most hypotheses are accepted.

**Keywords:** sufficiency economy, psychological traits, self control, self-efficacy, internal locus of control
Why do natural products act as neurocognitive enhancers?

SCHOLEY, A. (NICM Centre for Neurocognition, Brain Sciences Institute, Swinburne University)

Over the past decade or so there has been a substantial increase in research into the effects of herbal extracts, including their potential to protect against cognitive decline. Unlike mainstream ‘magic bullet’ pharmaceuticals, such extracts may contain dozens of active components. It appears that some have these may have evolved with a combination of properties which, in concert, may affect multiple neuronal, metabolic and hormonal systems. Since cognitive processes are themselves modulated by such systems, the effects of herbal extracts may particularly depend upon complex interactions within and between physiological systems which underlie cognitive performance. This talk will describe a systematic assessment of the behavioural effects of herbal extracts with particular relevance to cognitive decline and enhancement. These have been selected on the basis of their historical or anecdotal use as agents which may influence mood and cognitive performance. Those assessed include Ginkgo, Ginseng (Asian and American), Melissa Officinalis (Lemon balm), and species of Salvia (Sage). All studies reviewed have used double-blind, placebo controlled, methodology in which the behavioural effects of several doses of standardized extracts were assessed. The results indicate that many herbal extracts are capable of modulating cognitive performance, often in ways which are strikingly in keeping with their traditional use. For example sage, ginseng and ginkgo have repeatedly been shown to improve memory and lemonbalm exerts anti-stress effects. This work is in its infancy but may uncover promising candidates for maintenance of wellbeing and mental health throughout the lifespan and even treatments for conditions where mental function becomes fragile – including during ageing and in dementia. Additionally, the notion that the human cognitive performance can also be improved in cognitively intact individuals both challenges prevailing views of brain function and has important applications in many areas of psychology.

Keywords: herbal extracts, dementia, cognitive processes, cognitive performance, memory

Phyto-therapeuticals for cognitive enhancement, behavioural and psychological symptoms associate with Alzheimer’s disease (AD)

OKELLO, E. (Medicinal Plant Research Group, Newcastle-upon Tyne)

Currently there is no cure for Alzheimer’s disease (AD). It is an irreversible, progressive brain disease. Existing treatments, based on the so called cholinesterase inhibitors (e.g. Tacrine, Revastigmine, Donepezil, Galanthamine) and various neuroleptics are aimed at treating the symptoms. These symptom include cognitive dysfunction, primarily; memory loss, language deficit, depression, agitation, anxiety, and in some cases psychosis. However, like many synthetic drugs, the benefits of AD treatments are accompanied by some unwanted side effects such as liver toxicity, anorexia, diarrhoea, nausea and vertigo, with a number of queries on costs effectiveness and safety. Current developments in the search for novel treatments include those that seek to slow down the progression of the disease or indeed prevent its onset. These include natural products with antioxidants, anti-inflammatory, cholesterol lowering and estrogenic properties. Many herbal products or nutraceuticals possess these properties and their uses are increasingly guided by standardized preparations, evidence of scientific mechanisms and clinical trials. I aim to review the evidence supporting the use of phyto-chemical based therapies for cognitive enhancement and treatment of behavioural and psychological symptoms associated AD. The paper will provide a review of published data as well as new data into plant extracts with mechanisms relevant to the treatment of dementia. A number of plant based products show great potential in their use for complementary inclusion in the treatment of various symptoms associated with AD. A number of plant based products are providing us with new therapeutic leads for the prevention or treatment of dementia and other psychiatric disorders. Their clinical efficacy, safety and mechanisms accounting for
The improvement in some of the symptoms associated with dementia are increasing being reported in well designed scientific studies.

Keywords: Alzheimer’s disease, progressive brain disease, cognitive dysfunction, phyto-chemical based therapies, dementia

The rejuvenating and memory enhancing properties of the standardized extract of the Ayurvedic medhya - rasayana plant Bacopa monniera.

SINGH, H. (Central Drug Research Institute, Hygia Institute of Pharmaceutical Education & Research, Lucknow)

Bacopa monniera is an extremely important Ayurvedic plant used as medhya-rasayana (rejuvenating and memory enhancing) in India since the time of Vedic civilisation. The “threesome” of Ayurveda, viz. Charak, Sushrutu and Vagbhatta have attributed many psychoneuropharmacological properties to bacopa, e.g., augmenting learning and memory, prolonging life span, anti-anxiety and have prescribed it to be used in various neurodegenerative disorders which are akin to cerebral atrophy, Alzheimer's disease (total loss of memory) and clinical cognitive disturbances like obsessive compulsive disorders, parkinsonism and multi infract amnesia. It was also prescribed for treatment of major psychiatric disorders like insanity and morbid anxiety. Extensive research has confirmed these traditional claims of bacopa and also to find new therapeutic properties. A standardized extract of the plant having an optimum memory enhancing effect was developed and designated as CDRI-08. In animal studies, CDRI-08 showed a significant improvement in all the three phases of learning, i.e. short-term, intermediate and long-term memories by significantly augmenting the consolidation, acquisition and retention processes. CDRI-08 also showed pronounced anti-amnesic, neuroprotective, anti-oxidant, anti-stress and adaptogenic effects. Having confirmed the safety of the extract in regulatory toxicity studies, clinical trials were conducted in children and adult human volunteers. In children, CDRI-08 increased the raw score and decreased error, reaction and performance times in Wisc Maze test. It also augmented digit forward, digit backward and raw scores in Digit Span Test. In children suffering from Attention Deficit Hyperactivity Disorder (ADHD), CDRI-08 significantly improved sentence repetition, logical memory and digit span tests scores. In the patients suffering from anxiety neurosis, CDRI-08 significantly reduced insomnia, tremors, irritability, nervousness and anxiety and increased mental fatigue - work output ratio. In the subjects suffering from Age Associated Memory Impairment (AAMI), CDRI-08 significantly enhanced mental control, logical memory, digit forward, digit backward and paired associate learning. In elderly subjects (55-70 years), the CDRI-08 significantly enhanced the oxygen intake capacity, haemoglobin counts, and provided symptomimetic relief in low back pain and sciatica. The CDRI-08 offers a potential therapy for the treatment of cognitive impairment, stress, anxiety and overall improvement in general well-being.

Keywords: memory, Bacopa monniera, Ayurvedic plant, neurodegenerative disorders, CDRI-08

Evaluating the cognitive effects and mechanisms of Bacopa.

STOUGH, C. (NICM Centre for Neurocognition, Brain Sciences Institute, Swinburne University)

Bacopa monniera or brahmi has been traditionally used for centuries to improve cognitive functioning. More recently there has been a great deal of in vitro and in vivo animal research focusing on its neurochemistry and mode of action. In this presentation I discuss research on brahmi in both animals and in human trials assessing neurocognitive functioning. I start off with a brief discussion of the mechanisms of action of brahmi generating hypotheses about its action on the human brain and on human cognition/ intelligence. A review of available human clinical trials including their samples, outcome measures and conclusions is then presented. Data from two chronic and one acute study are presented. The methodology of these studies follow standard randomized controlled trial procedures, in which double blinding is utilized. Across the three studies, approximately 200 participants aged from 18
to 70 have been enrolled. All participants completed significant neuropsychological and cognitive test batteries at baseline and 3 months for the 2 acute studies and baseline and at 3 hours for the acute study. Results indicated consistent cognitive improvements in memory and information processing in the chronic studies. Additionally some evidence for an anxiolytic effect was observed in both chronic and acute studies. The results of the studies suggest that chronic administration of bacopa may improve cognitive functioning and decrease anxiety. These results may be particularly important in groups showing cognitive decline such as in the elderly. The results of these studies are discussed in terms of future trials and mechanistic studies.

Keywords: *Bacopa monniera*, cognitive functioning, neurochemistry, information processing, memory

**The challenges of evidence based herbal medicine**

ZANGARA, A. (Flordis Natural Medicines/Swinburne University/Newcastle University)

Assessing the safety and efficacy of medicines, whether conventional or herbal, is a continuous challenge from pre-clinical to clinical phases of research. However, evidence based herbal medicinal research presents unique problems and challenges to the researcher and the producer, who must be well aware of in order to safeguard the quality of the data obtained and quality of the products on sale. Herbal preparations for cognitive functions, as for any other health areas, can vary considerably in their effects and safety if the process from ‘seed to patient’ is not properly controlled and reproduced into the future. The psychopharmacology of herbal products delivered through a complex mix of bioactive components presents many challenges: the quality of raw materials; processing, manufacturing, and clinical study designs and outcome measures. Besides, “bioequivalence” is difficult or impossible to achieve with herbal products due to their chemical complexity. The variability that can occur at any stages of herbal medicines development is due to many controllable factors. Clinical, toxicological and pharmaceutical evaluation can insure the safety and efficacy of herbal medicines, but trial results are specific to the preparation researched. Particularly within the evaluation of the cognitive effects of herbal extracts, results can easily vary depending on many factors, therefore it is one of the most challenging health areas in evidence based herbal medicine.

Keywords: safety, herbal extracts, cognitive functioning, psychopharmacology, medicinal research
Navigating the stresses and strains of women's lives: Advice from applied psychology research

Chair(s): HALL, R. (The College of New Jersey)
Discussant(s): DENMARK, F. (Pace University)

The purpose of this symposium is to bring together researchers who are interested in solutions to social problems in women's stressful daily lives. The problems in question include a chilly workplace climate, work-family balance, interpersonal and routine health concerns, and developmental challenges in mid-life. The authors report the results of qualitative and quantitative studies and literature reviews, with a focus on solutions. Implications of the research for institutional and public policy and for therapeutic interventions are discussed by the presenters and our discussant. Among the strategies we present are ways to develop women's careers and leadership potential on the job, ways to re-conceptualize gender role identities and challenge societal demands, ways to cope with common health symptoms and learn to express one's desires honestly, and ways to use religion and spiritual values to frame positive development in the second half of life. The presenters come from the U.S. and Israel; all are experts in the psychology of women and gender, as are our chair and discussant.

Career and leadership strategies for women in academe

ROSE, S. (Florida International University)

The goals of the present research were twofold: (a) to describe issues contributing to a continuing chilly climate for women in academe; and (b) to identify successful strategies to develop women’s careers and leadership potential. The findings were derived from case studies completed by the author during consultations with women faculty at universities in the U.S. The case studies included participants in career development training programs for women in academe conducted at five large public universities, one small liberal arts college, and among three regional groups of women faculty sponsored by the National Science Foundation. Women faculty ($N = 149$) completed a survey assessing the institutional climate for women at their institution, participated in individual interviews concerning their career path, and completed a training program aimed at identifying “next steps” in their careers, as well as long-term goals. Significant issues confronting women professors included: lack of knowledge of the informal criteria for tenure and promotion; assignment of dissimilar teaching and service loads to men and women peers; salary inequities; and lack of availability of childcare. Individual solutions that were preferred focused on enhancing professional visibility, building negotiation skills, and maintaining priorities. Key themes contributing to a continuing “chilly” institutional climate for women included: gender inequities in startup funds and salary; inequitable or arbitrary treatment across departments and/or schools by Chairs and Deans; and “unintended slights” or “microinequities”. Factors that served to “warm” the climate included having senior women in leadership positions; the standardization of peer review procedures; and the institution’s commitment of resources to improving conditions for women, such as through NSF ADVANCE grants, endowed professorships, or gender equity training for administration. Many colleges and universities have made efforts to improve the institutional climate for women in academe, but the success of such programs is mixed. The results of the present study suggest specific ways to enhance the climate at both the individual and institutional level.

Keywords: leadership, career development, training, gender

Working mothers in Israel

SCHEIN, A. (Netanya Academic College), MUHLBAUER, V. (Netanya Academic College)

The purpose of this paper is to examine the integration of Israeli women into the labor
market in view of the conventional gender arrangements that are maintained in the rhetoric and practice of "the working mother." The common expectation is that working mothers will develop strategies that enable them to function satisfactorily both in the family and in the labor market at the same time. The paper is a conceptual literature review with theoretical implications. It is based on data collected by the author and others over the course of a decade. It was found that the proportionate number of Israeli women joining the labor market has significantly increased since the 1970s, so much so that the dual-earner family is now considered the norm. This positive change towards greater gender and occupational equality is complicated, however, by the persistence of certain cultural and political structures that perpetuate the historical connections between gender and position within the family. In various social and political presentations of men and women, power gender hierarchies continue to hold sway. On the basis of the present study, it can be concluded that the contours of the shift of working mothers towards the labor market are shaped by gendered structures and ideologies that tend to maintain their hold on major role identities. The author will provide suggestions for women who must navigate their lives within these gendered structures amid ideological messages that might erect barriers that frustrate women's desire to combine work and family.

Keywords: Israel, women, family, gender, occupational equality

Perfectionism, self-silencing, and the experience of premenstrual syndrome

CHRISLER, J. (Connecticut College)

The purpose of the current study was to examine perfectionism and self-silencing in a community sample of adult women, who were recruited via internet discussion boards and Craigslist to participate in a study of “personality, attitudes, and women’s health.” Among the research questions were whether perfectionism and self-silencing scores would be correlated and whether either perfectionism or self-silencing scores would predict 1) women’s tendency to use dualistic discourse, or 2) women’s belief that their premenstrual symptoms in general or their emotions in particular are difficult to control. A total of 182 women from North America participated in this study. A link to the online survey was advertised on message boards and on Craigslist in 18 cities. The mean age of participants was 29.6 years (SD = 7.8; range = 18-46 years). The majority were White (71%), heterosexual (89%), menstruating regularly (71%), not using oral contraceptives (65%), and had “moderate” to “strong” premenstrual symptoms (54%). Although most women indicated that they have experienced PMS (89%), only 10% have been diagnosed. Participants completed the Frost Multidimensional Perfectionism Scale, Affective Control Scale, Silencing the Self Scale, Health Locus of Control Scale, and a Dualistic Discourse Scale that was designed for this study. It was found that dualistic discourse (me vs. my “PMS self”), affect control, tendency to self-silence, and perfectionism were all positively correlated. There were differences between women who said that they have PMS (n = 90) and women who said they do not (n = 78). Women with PMS scored significantly higher on the Affective Control Scale and the Dualistic Discourse Scale. Those who believe they have PMS were more concerned about losing control of their emotions. In effect, they may explain or justify their loss of control by using dualistic discourse about their “true selves” versus their “premenstrual selves.” Neither perfectionism nor self-silencing predicted dualistic discourse, $p > .05$. However, self-silencing ($p = .001$) and perfectionism ($p = .045$) both predicted affective control ($R^2 = .483, p < .001$). It was concluded that interventions based on reducing perfectionistic and self-silencing tendencies may prove to be useful to women with moderate to strong premenstrual symptoms.

Keywords: women’s health, self-silencing, premenstrual symptoms, perfectionism, dualistic discourse

Religion and values during women’s midlife development

HOWELL, L. (Queens College)
The overall study endeavored to understand and describe women’s mid-life development so that therapists and mid-life women could facilitate their process. Focus groups of women from varying income, educational, racial, religious, ethnic, sexual orientation, and marital status backgrounds were conducted in the United States, in the rural Midwest and in New York City. Grounded theory analysis was performed on data collected by recording and transcribing the group sessions. Five groups of women were each interviewed either three or four times until redundancy was achieved in their conversations. Religion and values emerged as one of the themes of the women’s discussions, both in rural and urban focus groups. As life circumstances dramatically changed (usually between ages 45 and 50), women responded to associated fear, anxiety, sadness and confusion by reexamining their lives. Many returned to religions that they had left. Some discovered twelve-step groups, and many searched for and found meditation, spiritual paths, and religions new to them. Some said that they wished they could find comfort in religion but they had not found such a spiritual home. The focus groups were led in a non-intrusive way. However, two constraints were agreed upon prior to group discussion: 1) no advice was to be exchanged, and 2) conversation was to be confined to each participant’s personal experience—no stories about friends or family unless they impacted the participant in some way. Likewise, the facilitators refrained from evaluative comments about the content of participants’ statements. The women responded in dramatic ways to the simple process of sharing their experiences and hearing those of others. However, they expressed difficulty finding credible and reliable information about what they were experiencing. Information abounds, but much of it does not measure up to scientific standards. Many opportunities will be discussed for therapists, writers, and middle-aged women. Among them are: how to address predictable variations in mid-life development, implications of race, sexual orientation, and socio-economic status, opportunities for therapists to provide useful information on mid-life, ethical implications of discussing religion with clients, and “spiritual emergency” as a motivator.

Keywords: women, mid-life development, religion, values, grounded theory analysis
Neuropeptides, social behaviour, and potential for clinical treatments: Translational neuroscience in the psychology clinic

Chair(s): GUASTELLA, A. (Brain & Mind Research Institute, University of Sydney)

Recent development in the field of neuroscience have placed the neuropeptides oxytocin and vasopressin as having a critical role in the development and regulation of social behaviour and associated psychopathology. This research has culminated in the development of neuropeptide models of psychopathology that have the potential to advance clinical treatments for disorders associated with interpersonal dysfunction. This particular symposium brings some of the leading researchers in this research field and aims to describe the role of neuropeptides in social cognition and function, as well the role more specifically of oxytocin in reward and addiction. Speaker 1 will present a range of experiments to demonstrate how oxytocin nasal spray influences social cognition and present a cognitive model to the study of neuropeptides. This model will be used to elucidate potential applications of oxytocin to treat clinical disorders. Speaker 2 will discuss the role of oxytocin in reward and discuss how oxytocin and dopaminergic reward systems may regulate social function and addictive behaviours. Speaker 3 will then focus on vasopressin and present some of the first studies evaluating arginine vasopressin influence on social cognition. Finally, Speaker 4 will summarise the symposium findings and present a new neuroscience-based conceptualization of the role of neuropeptides on social cognition and behaviour in humans.

Oxytocin to enhance social cognition in humans: Results from experimental cognitive designs

GUASTELLA, A. (Brain & Mind Research Institute, University of Sydney)

Oxytocin is known to have an important role in social behaviour in humans; however its underlying mechanisms are poorly understood. This talk summarises a series of experiments conducted by the author to tease apart the influence of oxytocin nasal spray on social cognition and information processing strategies in humans. Participants were administered oxytocin nasal spray and then given a social cognition and information processing challenge tasks. Results over a series of experiments show that oxytocin promotes the processing of positive social cues over those that are threatening or non-social. Results of these studies provide clear cognitive mechanisms for how oxytocin could facilitate approach related behaviours in humans. Implications for clinical treatments will be discussed.

Keywords: oxytocin, social behaviour, nasal spray, cognition, information processing

Oxytocin as a novel treatment for drug dependence: From the bench, to the street, to the clinic

CARSON, D. (Brain & Mind Research Institute, University of Sydney)

Increasing evidence suggests the neuropeptide oxytocin may be utilised as a treatment for a wide variety of psychopathologies, including addiction. Using a translational approach we aimed to determine the efficacy of oxytocin as a novel treatment for addiction. In a first study we trained rats to lever press to intravenously self-administer methamphetamine. Once responding had stabilised, one group of rats received escalating doses of oxytocin prior to daily self-administration tests while other rats received vehicle. After these tests, lever pressing was extinguished and the ability of methamphetamine primes to reinstate responding was studied with and without co-administration of oxytocin. In a separate study, using Fos immunohistochemistry we determined the ability of oxytocin to compete with a methamphetamine challenge and assessed the behavioural effects of this interaction through assessment of locomotor...
hyperactivity. To provide insight into alterations in neuropeptide systems during drug intoxication in humans we collected blood from a group of methamphetamine intoxicated adults and compared their plasma levels of oxytocin, vasopressin, and cortisol to a drug naive healthy control group. We are now conducting a randomised clinical trial of chronic intranasal oxytocin in cannabis dependent patients and assessing a multitude of cognitive and behavioural effects resulting from this treatment. We showed that oxytocin dose-dependently reduced responding for intravenous methamphetamine in rats and significantly reduced relapse to drug-seeking. Secondly, our results showed that oxytocin effectively suppressed methamphetamine induced neural activity in key addiction related brain areas as well as reduced methamphetamine induced hyperactivity to a level similar to that of control animals. Our data also provide further insight into alterations in the neuropeptide systems in drug addicted humans, specifically methamphetamine users. I will finish by discussing some preliminary findings from the randomised controlled trial of intranasal oxytocin for cannabis dependence. We provide important insight into the role of oxytocin in drug addiction and argue its use as a novel therapeutic agent for drug dependence.

Keywords: neuropeptides, relapse, drug dependence, methamphetamine, oxytocin

Intranasal arginine vasopressin enhances social cognition in humans

ALVARES, G. (Brain & Mind Research Institute, University of Sydney)

Arginine vasopressin is a crucial hormone in the regulation of social behaviour. Like oxytocin, it is well know for its role in promoting social approach behaviours but it also has a more complex role in the regulation of social and territorial aggression, across numerous mammalian species. While the hormone has been implicated in the etiology of numerous clinical disorders associated with interpersonal dysfunction (e.g., Depression, Borderline and Anti-Social Personality Disorder), there is little understanding of its influence on human social cognition. In a series of experiments, students were administered with arginine vasopressin nasal spray or a placebo before completing social cognition challenge tasks. Results of these studies provide the first evaluation in humans of arginine vasopressin nasal spray influence on social cognition. Arginine vasopressin has a a very different influence on human social cognition to what has been found with oxytocin. Results will be presented at the time of presentation. Arginine vasopressin had a more complicated but facilitatory influence on human social cognition in humans. These results are discussed in direct relation to the broader neuropeptide research field and the neurobiology of social function, as well as what these results mean for the role of vasopressin in the etiology of clinical disorders and interpersonal problems.

Keywords: Arginine vasopressin, hormone, social behaviour, interpersonal factors, aggression

The psychology of Oxytocin: Prosocial Behaviour, social salience or approach-related emotion

KEMP, A. (School of Psychology, University of Sydney)

There is strong research interest in the role of the neuropeptide oxytocin in human affect and debate over whether oxytocin is involved in purely positive pro-social behaviours or a more general involvement in the salience of social behaviours. Research findings from our own laboratory and the broader literature will be reviewed and an alternative proposal presented. It will be argued that oxytocin may serve to increase approach-related behaviours while inhibiting withdrawal-related behaviours. This proposal is supported by the psychology and neuroscience of approach- and withdrawal-related behaviours that highlight a distinction between positive and approach-related emotions as well as preliminary neuroimaging studies suggesting that oxytocin may reduce uncertainty about the predictive value of social stimuli, which may then facilitate approach behaviours. In summary, the psychology and neuroscience of approach and withdrawal behaviour in humans will be reviewed and a theoretical framework presented, from which recent human research...
Abstracts of the 27th International Congress of Applied Psychology

on the role of OT in social behaviour may be better understood.

New approaches to the assessments of achievements by students with additional needs (SWANS): A four year study of development

Chair(s): CARE, E. (University of Melbourne)

This set of papers outlines research undertaken to develop and validate procedures for monitoring learning progress for students with additional learning needs. The research is grounded on international and national shifts towards standards- and criterion-referenced assessment of student outcomes. It extends that work to assist teachers to assess and report development for students with diverse intellectual and learning disabilities and to foster the use and dissemination of teaching strategies and resources that are specifically linked to learning standards and pathways. The primary aims of the project were: (1) To develop and validate assessment materials that describe expected progress in the foundational skills of communication, literacy, intrapersonal learning and interpersonal processes for students with additional learning needs, and that are appropriate for all students regardless of the nature of their learning needs; (2) To investigate relationships between sub-types of additional learning needs and learning pathways; (3) To assist teachers in both mainstream and special schools to use the assessment materials to inform their decisions about effective and targeted teaching strategies for students with additional learning needs, and to monitor and report their students’ progress. The papers provide descriptions of finalised measures, and identify differences across diverse groups of students with additional needs.

A framework for assessing students with additional needs (SWANS)

GRiffin, P. (University of Melbourne)
This project addressed an area of educational assessment that has been for many years neglected as ‘too hard’. If developmental progress can be mapped and identified in competency terms and linked to successful teaching and learning strategies, students can be expected to make more rapid progress towards achieving their potential. Teachers in mainstream schools can also expect to be helped in recognising development and given advice for intervention. The project undertook to design measures which sampled relevant domains of development for children with special needs. Profiling developmental standards of learning for students with intellectual disabilities was proposed as a way of helping teachers to monitor and intervene accurately and appropriately for individual students. A competency-based assessment approach was applied in the project to assessment of these students. After identification of major domains of functioning, through literature review and fieldwork, items were developed to sample the developmental domains, and data collected through teacher responses concerning specific students. These data were analysed through an item response modelling approach, and the measures finalised for professional use. Over the three years of the project, data from the teachers of 1700 students were analysed and used to generate student profiles which are linked to intervention strategies for teacher use. The method represents a new approach to judgement-based performance measurement and offers a way of maximising reliability and nomological approaches to validity. The method also provided the state government with a basis upon which to build a new funding model for schools dealing with students with additional needs (SWANS). The implications of the study are likely to be manifested in new government policy on funding for these students.

Keywords: assessment, development, intellectual disability, performance, validity

Assessment of communication and literacy skills in students with additional needs (SWANS)

WOODS, K. (University of Melbourne)

This study addressed a need for the assessment of students with intellectual disabilities in the areas of communication and literacy. The study used item response modelling to develop an observation protocol for teachers. This enabled students to be placed on a level within a hierarchy of development. The purpose of the developmental hierarchy was to assist teachers to identify the Vygotsky’s zone of proximal development and then to advise them of possible resource and teaching strategy. Items sampling the domains of communication and literacy skills were developed based on input from expert panels. In 2008 these were responded to by more than 700 teachers and 1700 students from 21 mainstream and 56 specialist schools in Victoria, concerning their students aged from 3 years to 18 years. The items were responded to on hard copy OMR scannable survey forms and later converted to an online system of data capture. The 2008 results were subjected to item response modelling and scale analyses. From these data, two subscales (Communication and Literacy) were identified, with alpha coefficients ranging from 0.96 to 0.98. The instruments were then used to construct developmental learning progressions for each of the domains. Teachers were assisted in interpreting the data and how to intervene strategically to enhance the student development. Pre test and post test assessment shows growth of the students beyond the expected levels within the specific interventions. In particular this study examined the communication and literacy competencies of students with intellectual disability, mapped the developmental progression, and provided teachers with a series of assessment protocols and resource advice. It demonstrated that mainstream teachers (and special education teachers) could benefit from the advice linked to developmental learning progressions and when targeted intervention was used, children with learning disabilities could make steady progress.

Keywords: assessment, intellectual disability, communication, literacy, teaching

Assessment of interpersonal processes in students with additional needs (SWANS) COLES-JANESS, B. (University of Melbourne)
The aim of this study was to explore whether interpersonal processes can be annexed to a meaningful progression other than an age-based normative framework. If so, constructed profiles may offer teachers a conceptual map which can be used to guide their instructional decisions. The challenge of the study was to construct a measure that was based in theory, and that framed skills in terms of overarching social goals or tasks that were applicable across multiple settings. A series of workshops with specialists, researchers and teachers identified critical indicators of development which were collated into an observation instrument. Teachers completed the observation survey to measure the social-emotional competencies of their students. Additional needs were distributed across the functioning domains of communication, language and literacy; mobility; cognitive capacity; social and emotional development. Students were also identified with co-occurring additional needs such as autism spectrum disorder, behavioural problems, cerebral palsy, Down syndrome, vision impairment, ADHD. Data for 1700 students were returned in 2007 for the development phase of the project, and data for 600 students were returned in 2008 for the calibration phase. Results are reported across the areas of social interaction, social responsibility, and transcending social difficulties. The emphasis in this report is on the extent to which the constructed ability continuum can represent student interpersonal processes across diverse groups of students. Exploration of differential item functions indicates that the items were stable across diverse groups. The study found that a developmental progression of interpersonal development can be established as a unidimensional construct applicable to students with a wide age range and intellectual disabilities. Pre and post tests also indicated that with adequate guidance, students were able to make better than expected progress across levels on the developmental progression.

Keywords: interpersonal processes, conceptual map, teachers, students, additional needs

Assessment of intra-personal skills in students with additional needs (SWANS)

ROBERTS, E. (University of Melbourne)

The aim of the research described in this paper was to build a protocol for describing students’ development of emotional knowledge and understanding, and to tailor this to the requirements of assessing the progress of students with additional needs. The paper reports the establishment of a developmental profile, using item response modelling procedures for defining standards-referenced frameworks (Griffin, 2007). This resulted in the development of an observation questionnaire of students’ emotional skills. The approach relied on the knowledge and collaboration of experienced teachers and researchers in the fields of special education and emotional development to establish a hypothesised framework of critical skills, observable behaviour statements, and developmental criteria that map qualitative transitions in student performance. The framework was validated against observation data gathered by teachers in 2007, from 77 Victorian government schools (21 mainstream, 56 special education) on 1597 students (3 to 18 years) with additional needs. Their responses were calibrated using partial credit item response modelling to identify empirically major transitions in students’ emotional development and to establish the construct validity of the profile. This resulted in developmental progressions with eight levels of development defined by tasks that students completed. A separate scale was developed based on a sample of more than 400 autistic children; pre and post test measures showed growth on most cases and these were validated using nomological approaches testing hypotheses for causes of variation in measures obtained from the instrument. The results supported the validation procedure. The study has demonstrated that it is possible to chart the developmental learning pathway in intra personal skill development of students with intellectual difficulty. In particular it demonstrated a different developmental pathway for autistic children in the cognitive domain. Intervention strategies and materials have been associated with different rates of development.

Keywords: intra-personal skills, additional needs, students, protocol, emotional knowledge
New approaches to the treatment of obsessive compulsive and related disorders: Self-related concepts in the understanding and treatment of psychopathology

Chair(s): MOULDING, R. (SwinPsyCHE Research Centre, Swinburne University of Technology)

Discussant(s): FROST, R. (Smith College)

Research has supported the efficacy of cognitive-behavioural therapy (CBT) in the treatment of Obsessive-compulsive problems. However, outcomes vary, dropout/relapse rates remain generally high, and for many, effective treatments remain inaccessible. This highlights the need for fresh approaches that target specific factors predictive of poorer outcomes, that seek to develop novel treatment strategies based on new theories, or that develop new modes of delivering existing evidence-based treatment. This symposium brings together four studies addressing some of these issues in the treatment of Obsessive-Compulsive Disorder (OCD) and Body Dysmorphic Disorder (BDD), both disorders that are characterized by high degrees of obsessive-compulsive behaviours. The first two papers focus on some of the factors related to severity of symptoms and that may possibly predict poorer treatment outcome. In particular, the first paper examines the relationship of depression and symptom severity and discusses possible implications in terms of treatment, while the second paper discusses the role of cognitive factors in predicting treatment outcome following a CBT group treatment. The third paper focuses on the use of new technologies in delivering effective evidence-based treatments for these disorders and discusses the development and evaluation of an internet-based therapist-assisted CBT treatment program for OCD. Finally, the fourth paper presents the development of new treatment for BDD concerns that is based on an Acceptance and Commitment Therapy approach. The preliminary findings of an evaluation of a 12-week ACT based treatment for BDD are discussed.

Cognitive and behavioural predictors of depression in obsessive-compulsive disorder.

KEONG YAP, A. (RMIT University), MOGAN, C. (University of Melbourne), KYRIOS, M. (Swinburne University of Technology)

This study aimed to examine the characteristics of obsessive-compulsive disorder (OCD) patients with and without depression. Consistent with previous research, we expected to find a relationship between depression and (1) OCD severity, (2) anxiety, (3) obsessive-compulsive beliefs, (4) insight, (5) avoidance, and (6) severity of harm-related obsessions. Participants were 46 OCD patients with comorbid clinical depression, and 56 with OCD only. The results showed no significant differences between the two groups on all measures. However, analyses showed that the severity of depressive symptoms was positively correlated with anxiety, avoidance, harm-related obsessions and impulses, and obsessive-compulsive beliefs. These factors accounted for 50% of the total variance in predicting the severity of depressive symptoms, with anxiety and avoidance making significant unique contributions to the final model. Results suggested that interventions dealing with anxiety, obsessive-compulsive beliefs and avoidance might be important components for treatment of OCD with comorbid depression.

Keywords: obsessive compulsive disorder, depression, anxiety, beliefs, avoidance

Delivering CBT in groups when treating OCD: Effectiveness and predictors of treatment outcome

MOULDING, R. (Swinburne University of Technology), NEDELUKOVIC, M. (Swinburne University of Technology), KYRIOS, M. (Swinburne University of Technology)

There is considerable research evidence supporting the efficacy of individual cognitive-behavioural therapy (CBT) for obsessive-compulsive disorder (OCD) patients. However, due to the high cost and inconvenience of individual therapy, group therapy has gained increasing attention as a viable alternative. The purpose of this symposium is to present research on the effectiveness of delivering CBT in groups for OCD patients and to discuss the predictors of treatment outcome. The symposium will include presentations of three studies: the first study will present the results of a randomized controlled trial comparing individual and group CBT for OCD, the second study will present the results of a meta-analysis of group CBT for OCD, and the third study will present the results of a longitudinal study examining the predictors of treatment outcome in group CBT for OCD.
behaviour therapy (CBT) in treating Obsessive-Compulsive Disorder (OCD). However, access to such treatment is limited. There is an increasing recognition of the need to improve access to effective treatments, while taking into account the economic costs of delivering such treatments. There is emerging evidence of the effectiveness of group CBT in treatment of OCD, although more research is needed to examine the factors related to treatment outcomes. This study examined the effectiveness of a 12-week manualised group CBT program in reducing symptom severity and leading to changes in a range of cognitive factors associated with the disorder. It also sought to examine possible predictors of treatment outcome. Results are discussed in terms of the potential costs and benefits of this approach to treatment.

Keywords: cognitive behavioural therapy, obsessive compulsive disorder, treatment, symptom severity, costs

Internet based CBT for OCD: Changing the mode of delivery of effective evidence-based treatments

NEDELJKOVIC, M. (Swinburne University of Technology), KYRIOS, M. (Swinburne University of Technology), MOULDING, R. (Swinburne University of Technology), KLEIN, B. (Swinburne University of Technology), AUSTIN, D. (Swinburne University of Technology)

Research has provided an extensive evidence base for Cognitive-Behaviour Therapy (CBT) as an effective treatment for Obsessive-Compulsive Disorder (OCD). However, this specialised treatment remains inaccessible for many Australian sufferers due to a shortage of appropriately qualified professionals (especially in rural and regional areas), individual financial constraints, and the social stigma associated with seeing a mental health specialist. Internet-based psychological treatments have shown promise in providing effective, accessible and affordable treatment for a range of anxiety disorders. OCD-STOP, an internet-based therapist-assisted CBT program for OCD, was developed in an effort to provide specialised, comprehensive, and low-cost treatment for OCD that is available to all Australians. This paper will present the initial findings relating to the effectiveness of OCD-STOP and discuss potential benefits in terms of accessibility, availability and cost-effectiveness of this new mode of service delivery.

A group acceptance and commitment therapy protocol for Body Dysmorphic Disorder

MANCUSOA, S. G. (Swinburne University of Technology), KYRIOS, M. (Swinburne University of Technology)

Body dysmorphic disorder (BDD) is a debilitating disorder characterised by an excessive preoccupation with an imagined or slight defect in physical appearance. Up to 71% of sufferers will seek dermatological or cosmetic surgery procedures, but these procedures are ineffective in treating BDD. Those sufferers who do seek psychological or psychiatric treatments represent particular challenges for the treating clinician, including impaired insight, difficulties with engagement, and poor treatment adherence. Acceptance and Commitment Therapy (ACT) may prove useful in reducing BDD symptom severity and improving treatment engagement and adherence. A 12-week group ACT treatment protocol for BDD and preliminary evaluation data will be presented.

Keywords: body dysmorphic disorder, physical appearance, Acceptance and Commitment Therapy, symptom severity, psychological treatment
New assessments of social and emotional abilities for applied settings

Chair(s): ROBERTS, R. (Center for New Constructs, Educational Testing Service)
Discussant(s): MATTHEWS, G. (University of Cincinnati)

There is growing concentration on the psychological assessment of noncognitive attributes; in education, the military, the workforce, and other applied settings. Particularly important has been a resurgence of interest in social and emotional abilities (and related competencies), qualities that early pioneers such as Dewey and Thorndike suggested were just as important as cognitive abilities to life success. Encumbered by measurement challenges, research into these constructs moved very slowly for nearly a century, but it appears there is currently something of a renaissance, motivated largely by new technologies, new conceptual developments, and advances in psychometric modeling. This symposium examines emerging paradigms that have been designed explicitly to assess social and emotional abilities. Each presentation focuses on a paradigm that has so far received scant attention in the research literature. Thus, paper 1 introduces symposium participants to an other-report form of the situational judgment test; the authors of paper 2 discuss their work using multimedia techniques to assess emotional abilities; paper 3 introduces the Theory of Planned Behavior (and related models) to measurement of job insecurity and emotional abilities; and paper 4 introduces new measurement paradigms for face cognition, an important component of social abilities. Each of the presentations shares a common concern with large data sets, psychometric modeling, the acquisition of validity evidence, and the relation that these social and emotional assessments has with valued outcomes. All four presentations thus end with speculation concerning the import of these findings in applied settings. The chair will provide an initial overview of these various contexts for the symposium, with an international expert in the field serving as a discussant. Key learning objectives of the symposium include: (1) Developing an increased awareness of the variety of social and emotional abilities that may be relevant for applied settings; (2) Understanding innovative new procedures that may be applied to a variety of research and applied endeavors; (3) Understanding the importance of psychometric modeling in the validity process; (4) Developing an awareness of the applications (i.e., selection, development, succession planning, and policy) of social and emotional concepts in a variety of applied settings (i.e., education, work, gerontology).

A first look at an other-report situational judgment test of emotion management

MACCANN, C. (University of Sydney), ROBERTS, R. (Center for New Constructs, Educational Testing Service)

Situational Judgment Tests (SJT) are frequently used for high stakes applied applications, in part due to concerns that alternative measures such as self-report personality assessments are susceptible to impression management. However, recent research indicates that SJTs may also be susceptible to impression management. One solution to this issue is to use other-report formats on SJT, where an observer reports the target’s probable behavior in a series of situations. This study is the first attempt of which the authors are aware that examines the differences between self- and observer-reports on an SJT. We explore this issue in an educational setting, using an SJT designed to assess emotion management in adolescents. The SJT was administered to 382 eighth-grade students (51% male) with typical performance instructions (i.e., “what would you do in this situation?”). The SJT was also administered to a parent of each student in other-report format (i.e., “what would your child do?”). Students also completed measures of personality, life satisfaction, feelings towards school, vocabulary, and mathematics. All measures were administered in proctored, computerized testing sessions. Both students and parents reported the students’ GPA in the
previous semester. Compared to self-reports, parent-reports showed: (a) lower means, (b) greater gender differences (in favor of girls), (c) higher correlations with Extraversion and lower correlations with Agreeableness, and (d) lower correlations with vocabulary. Self- and parent-reports were only weakly correlated ($r = .19$).

With respect to valued educational outcomes (in the present context: academic achievement, positive feelings towards school, and life satisfaction), both self- and parent reports showed near equal prediction. Although parent- and self-reports were weakly correlated, relationships with other criteria exceed this value, indicating that non-shared variance may not be composed of error variance. Rather, self- and other-reports may index different aspects of emotional management: Other-reports are necessarily based only on observable behaviors, whereas self-reports may use internal sources of information (though these may include impression management biases). Results support the idea that other-report format of SJT can be used, although research examining this issue with adults under high-stakes conditions is now required.

**Keywords:** other-report, situational judgment, emotion management

### Evidence supporting the use of multimedia assessments of emotional abilities in organizational settings

**SCHULZE, R.** (University of Wuppertal),
**MACCANN, C.** (University of Sydney)

It appears that there are limitations in extant assessments of emotional abilities (EA), with the need for alternative measurement approaches. Thus, two multimedia tests of EA were developed: (1) A situational judgment test (where participants rate a scenario for emotional relevance and salience) and (2) a principal-agent paradigm (where event-emotion contingencies in others have to be perceived and memorized and emotion-behavior contingencies inferred from observed behavior to predict future behavior). Two studies were conducted to determine whether: (a) the measures had adequate psychometric properties, (b) EA test scores were valid, and (c) the multimedia assessments had meaningful relations with educational and life outcomes. The studies involved 857 community college and university students. Study 1 examined the new tests’ relationships with emotions measures (e.g., the Mayer-Salovey-Caruso Emotional Intelligence Test), Big Five personality factors, five cognitive ability factors (e.g., fluid, crystallized ability), and outcome measures (e.g., GPA, coping with stress). Study 2 examined the test-retest reliability of the new measures, along with relationships with affect measured by the Day Reconstruction Method (DRM). In Study 1, both new measures were found to have (a) acceptable internal consistency reliabilities, (b) moderate to high relationships with emotion measures, (c) moderate to high correlations with cognitive ability measures, and (d) weak correlations with personality factors. Regression analyses suggested that the multimedia assessments consistently added to the prediction of GPA, over and above personality and intelligence. In Study 2, test-retest reliabilities were found to be satisfactory. The relationship that both the measures shared with the DRM were also highly suggestive: Correlations exceeded $r = .40$ for reported net positive affect while socializing and working. The multimedia assessments appear to have face validity and to have acceptable measurement properties. Relationships with personality, intelligence, other emotions measures, and valued outcomes indicate that the scores have demonstrable construct validity. The DRM results are highly suggestive for the practitioner; this approach is used in economic models and indicates that EAs may play a role in worker satisfaction and productivity, for example. We conclude with discussion of plans to conduct experimental and training studies.

**Keywords:** multimedia assessment, emotional abilities, organizational settings

### Job insecurity, emotional intelligence, workplace emotional reactions, and decision-making behaviors

**JORDAN, P.** (Griffith University), **ASHKANASY, N.** (The University of Queensland), **LAWRENCE, S.** (Griffith University)
During turbulent economic times, negative behaviors that emerge from perceptions of job insecurity can be a major issue. Although research has linked perceptions of job insecurity to stress, employees that feel insecure in their jobs may get caught in a pattern of negative behaviors. The aim of this research was to develop and test a model of the behavioral consequences of job insecurity and to examine the potential ameliorating effects of emotional intelligence. The theoretical framework for our research draws on Fishbein and Ajzen's (1975) Theory of Reasoned Action, Ajzen's (1991) Theory of Planned Behavior, and Threat Rigidity Theory (Staw, Sandelands & Dutton, 1981). Based on these models, we describe and justify twelve empirically testable hypotheses. The data for this research were collected in two field studies. In Study 1, we collected data using an internet survey completed by 217 participants. The data for Study 1 were collected over a 3 month period. In Study 2, we administered two paper-and-pencil surveys where we collected independent and dependent variables one month apart. Study 3 involved 579 employees of a large private organization in Australia. The data from both studies were analyzed using Structural Equation Models. These models reveal that job insecurity is associated with lower affective commitment and high work-related stress and this in turn leads to employees’ enacting poor decision-making behaviors (e.g., procrastination, blaming, hypervigilance, withdrawal). Based on our findings we note that emotional intelligence, and in particular, awareness and management of emotions, improved decision-making outcomes. Specifically, the findings from this research confirm that the negative effects of job insecurity on employee decision-making behaviors are ameliorated by respondents’ awareness and management of their own emotions. We conclude with a discussion of the theoretical and practical implications of our findings, and provide suggestions for future research.

Keywords: job insecurity, emotional intelligence, workplace

**Face cognition: Measures and applications**

WILHELM, O. (Humboldt University), HILDEBRANDT, A. (Humboldt University), SOMMER, W. (Humboldt University)

Face perception and face cognition are important social abilities. Available measures of these abilities are wanting. We developed a computerized battery with 15 indicators and refined and validated this battery in a series of studies. In studies 1 and 2 a measurement model with latent factors for face perception, face memory, and facial speed was established and replicated. Additionally, face cognition factors could be regressed only partly onto established ability factors. In study 3 we investigated age invariance of face cognition and found that primarily factor means change with age. The relative independence of established abilities was replicated. In study 4 we trained several experimental groups on specific factors of face cognition and found substantial improvements in mean performance. Taken together the results provide strong support for the ideas that: (a) there are several face cognition factors, (b) these factors are distinct from established ability factors: (c) that these factors show strong age decrements in means, and (d) that interventions can yield substantial improvements in mean performance. We will discuss interventions for an aging work force and suggest application of the measures for selection into jobs in which face cognition is crucial (e.g., airport security personnel). We will highlight current developments of our battery in the area of emotion recognition and emotion expression.

Keywords: face cognition, perceptions, measurement
New directions for work and organizational psychology

Chair(s): SINANGIL, H. K. (Marmara University)

Discussant(s): HAKEL, M. D. (Bowling Green State University)

Work and organizational psychology science and practice has been continuing to support and enhance the wellbeing of individuals, organizations and countries across continents since 1904. This symposium highlights some new developments and ongoing research. The topics to be presented and discussed in this symposium are on, the positive effects of self talk on self efficacy and employment; fit between employment flexibility characteristics and preference of youngsters; preferred leadership styles as actual and ideal leader behavior in organizations; future goals on work and organizational psychology and demands of civil society. The topics to be presented as contributions are various, however interrelated with the needs of individuals (professionals) and organizations across the globe.

The positive effects of self talk on self efficacy and employment

LATHAM, G. (Rotman Faculty of Management University of Toronto)

Social cognitive theory has practical utility for a severe problem in Europe and North America, namely, unemployment. Verbal self guidance, that is, changing dysfunctional to functional self talk, can be used to increase self-efficacy for both seeking and obtaining employment. Empirical research conducted by the author and his colleagues will be explained. The studies involve displaced managers, native North Americans, and women in Turkey over the age of 40.

Keywords: Social cognitive theory, unemployment, self guidance, self-efficacy

Fit between employment flexibility characteristics and the preferences of youngsters: influence on job attitudes and well being during a period of economical crisis.

PEIRÓ, J. M. (University of Valencia), ROCABERT, E. (University of Valencia)

During the last two years, clear signs of economical recession and financial crisis have appeared in most developed economies. In fact unemployment rates have grown and the quality of the jobs offered has been significantly reduced. In Spain the unemployment rate at the end of 2009 is near 20% and a large part of the jobs available in the labour market offer a temporary contract and arrangements that require flexibility in different features such as geographical mobility, or flexible time schedules. In a study conducted with a representative sample of the Spanish youth population (16-30 years) a number of flexibility job features has been considered (contractual, time scheduling, geographical; part time jobs; functional; qualification,) and the preferences of the youngster interviewed were also explored. On the basis of this information we have analyzed the fit or misfit between the characteristics of the job hold and the preferences of the youngsters about them. The misfit is a significant predictor of several indicators of well-being and work attitudes. The moderating effects of the perception of the labour market by the youngsters has also been analyzed.

Keywords: economical recession, financial crisis, unemployment, Spanish, young people

Preferred leadership styles and authoritarianism in organizations

SINANGIL, H. K. (Marmara University), YURTKORU, S. (Marmara University), DURMUS, B. (Marmara University), LITTRELL, R. (Auckland University of Technology)

The change in the ideal and actual leader behaviors during Time I and Time II studies are compared using LBDQ XII dimensions. Independent sample t-tests are used to make the analyses. The results revealed that except ‘role assumption’ all eleven dimensions have
shown significant changes in the actual leader behaviors. System oriented leadership dimensions of LBDQ XII: ‘initiation of structure’, ‘persuasion’, ‘superior orientation’, and ‘representation’ has decreased in the last 5 years (Mtime1=3.25, Mtime2=3.10, p = 0.00; Mtime1=3.72, Mtime2=3.44, p = 0.00; Mtime1=3.25, Mtime2=3.95, p = 0.00; Mtime1=3.42, Mtime2=3.71, p = 0.00 respectively). However ‘production emphasis’ has increased as actual leader behavior (Mtime1=3.15, Mtime2=3.33, p = 0.00). Whereas person oriented leadership dimensions of LBDQ XII: ‘consideration’, tolerance of freedom’, tolerance of uncertainty’, predictive accuracy’, ‘integration’ has increased in the last 5 years (Mtime1=2.86, Mtime2=3.30, p = 0.00; Mtime1=2.98, Mtime2=3.48, p=0.00; Mtime1=2.61, Mtime2=2.94, p=0.00; Mtime1=3.17, Mtime2=3.69, p = 0.00 and Mtime1=3.11, Mtime2=3.75, p = 0.00 respectively). Only ‘demand reconciliation’ has shown a decrease ((Mtime1=3.18, Mtime2=3.08, p = 0.00).

Results indicate Turkish leaders are exhibiting person oriented behaviors more and system oriented behaviors less than five years before. When the ideal leader behaviors are compared ‘role assumption’ and tolerance of uncertainty’ were not significant and all others were significant. In line with the actual leader behaviors it is found out that system oriented leadership dimensions decreased except production emphasis (Mtime1=3.71, Mtime2=3.46, p = 0.00; Mtime1=3.89, Mtime2=3.74, p = 0.00; Mtime1=3.79, Mtime2=3.59, p = 0.00; Mtime1=3.89, Mtime2=3.74, p= 0.00 and Mtime1=3.34, Mtime2=3.57, p = 0.00 respectively). Interestingly person oriented leadership dimensions of LBDQ XII, ‘consideration’, ‘predictive accuracy’, ‘integration’ ‘and demand reconciliation’ have decreased as ideal leader behaviors (Mtime1=3.66, Mtime2=3.35, p = 0.00; Mtime1=4.04, Mtime2=3.61, p = 0.00; Mtime1=4.12, Mtime2=3.73, p = 0.00 and Mtime1=4.03, Mtime2=2.56, p=0.00 respectively). Only ‘tolerance of freedom’ has increased over the 5 years (Mtime1=3.66, Mtime2=3.80, p = 0.00).

Keywords: leader behaviors, person oriented leadership, Turkish

Future goals on work and organizational psychology and demands of civil society

AVALONE, F. (University of Rome "la Sapienza")

In the first century of its existence, Work and Organizational Psychology has performed basic research, applied research, research and products development, intervention models in regards to organizational change. For the future, Work and Organizational psychology’s mission will move along the dimension of continuity. Instead, we can think about new perspectives if we argue in terms of goals rather than in mission. Work and Organizational Psychology future goals can move along the dimension of discontinuity. These new targets may be based on some changes occurred during last decades and can be summarized as follows: a) from individual to context: a lower centering on individual and more attention to relationship that each of investigated subjects – individual, groups and organizations – relates with each context; b) from monolevel framework to multidimensional analysis: research and adoption of integrated models that can account for diversity and interdependence of studied variables; c) from individual customer to social customer. The areas and topics of research have in the past suffered too much for organizational needs. Most of research has been produced on behalf and in favor of organizations and of companies in particular. There is a new call from civil society demands both in local and in global contexts. In this perspective, some cultural issues seem particularly evident and may become future goals of work and organizational psychology: 1) need to become not only more efficient but more effective, as individuals, as organizations, as systems; 2) comparison between religions, races, cultures and values and management processes of integration and differentiation able to establish new sites of global civilness; 3) definition of social responsibility of organizations, the ways by which work contexts can be environments of civilization (eg, environment, justice, education, health and well-being of workers and society as a whole; 4) demand for transparency and ethical tension in business and organizational practices (eg. research on practices of
exploitation, moral disengagement on individuals, groups and organizations).

Occupational health psychology research with high risk occupations

Chair(s): BROUGH, P. (Griffith University)

This symposium brings together recognised experts in psychological health and well-being and its application to workers within the high-risk industries. The four (Australian) presenters represent two separate international research collaborations; the symposium co-authors from New Zealand, Germany and the UK will also attend and participate in the resulting discussions. The symposium addresses the critical factors in liaison, sampling, data collection and reporting for this type of research and we present findings from our current applied research with policing, corrections and fire-fighter samples. Importantly the symposium focuses on the fact that applied experimental research can be conducted within these high-risk industries. The key learning outcomes of this symposium are: (1) To increase awareness of the critical factors that influence research success with the high-risk occupations; (2) To provide research examples demonstrating innovative designs and successful outcomes for the health and well-being of high-risk workers; (3) To encourage the instigation of evidence-based interventions that impact positively on employees’ health and performance.

‘Causes of the causes’: Psychosocial safety climate, worker psychological health and engagement

DOLLARD, M. (University of South Australia)

We address a gap in work psychology research and practice regarding the ‘causes of the causes’ of work stress; that is the origins of adverse psychosocial working conditions. Psychosocial safety climate (PSC) of organizations refers to policies, practices, and procedures for the protection of worker psychological health and safety that are largely driven by senior management. By extending
the Job Demands-Resources (JD-R) framework we explain how PSC affects psychosocial working conditions and in turn psychological health problems and engagement, via mediation and moderation paths. A longitudinal study of police constables (N = 141), in 23 police stations, with two measures (lag of 14 months). Hierarchical linear modelling (HLM) was used; PSC was aggregated to the station level; demands, resources, health and engagement were assessed at the individual level. Levels of PSC were found to be significantly lower than in a representative Australian worker sample. PSC predicted change in psychological health problems partially via job demands and job resources. PSC predicted change in employee engagement via job resources. PSC moderated the expected Demands X Resource interaction.

Several results were validated alternating the Level Two PSC station data with an independent sample of police constables (N = 186). Results supported the dual functionality of PSC in predicting both health and production (1) via prevailing working conditions triggered by PSC itself, and (2) via PSC enabling the utilization of resources to offset the negative effects of demands. This latter result is particularly important for first responder occupations like policing where some emotional demands may not be preventable. The PSC construct has practical utility helping police and other organizations meet their duty of care, legal and moral obligations. As a likely ‘cause of the cause’ the most effective target to prevent and control stress arising from psychosocial factors is PSC; building a psychologically healthy productive workplace. Research and practical attention needs to be given to the psychosocial safety climate construct as it has been in physical safety climate movement. Including organizational PSC in job stress models also represents an important extension.

Keywords: job demands, climate, stress, police

TUCKEY, M. (University of South Australia)

High-risk occupations have foreseeable risk of exposure to potentially traumatic events (PTEs). Although single-session individual debriefing is contraindicated, the efficacy of group psychological debriefing for protecting high-risk workers from psychological harm remains unresolved. Despite over 20 years of research, methodological flaws have prevented reliable and valid conclusions. To overcome limitations in the evidence base and move research outcomes forward, we conducted the first ‘gold standard’ trial of Critical Incident Stress Debriefing (CISD) following exposure to work-related PTEs. A randomised controlled trial compared the efficacy of CISD (the most widely used form of group psychological debriefing) with that of psychoeducation and a (screening only) control condition. Participants were 67 volunteer fire-fighters (91% male) who attended one of 20 PTEs. Random allocation took place on an event (not individual) basis. Pre- and one-month post-intervention measures of psychological distress (K-10), post-traumatic stress (IES-R), and alcohol consumption were collected. Data were analysed using multilevel modelling in MLWiN to account for the nested structure (individuals nested within events). Controlling for pre-intervention scores, only CISD led to a significant reduction in alcohol use at the post-intervention test. Significant changes in psychological distress and post-traumatic stress were not seen. This study provides the first ‘gold standard’ evidence that CISD can protect workers in high-risk occupations from the impact of PTEs. First, CISD ‘did no harm’, a legitimate concern for any intervention and particularly given findings and debate regarding individual debriefing. Second, although the benefits of CISD were limited to alcohol use, alcohol use may be the best indicator of a positive effect in our predominantly male sample: men tend to under-report psychological health symptoms, and low levels of pre-intervention symptomatology across the sample left little room for improvement. Unlike single-session individual debriefing, group psychological debriefing should not be abandoned, but more high quality is research is needed to establish when and for whom it works best. Despite difficulties achieving adequate levels of
internal control, conducting rigorous intervention research with high-risk occupations is not impossible. In fact, such research is vital to improve psychosocial support for these courageous workers.

**Keywords:** high-risk occupations, potentially traumatic events, critical incident stress, post-traumatic stress, alcohol use

**Are police officers really more stressed? Assessing the impact of police work by job role**

**BARBOUR, J. (Griffith University)**

The impact of emergency service work on civilian workers has received some attention in the literature, although the majority of published intervention studies have been applied only to operational staff members (e.g., police officers). The research does however suggest more similarities than differences in key occupational health psychology outcomes when comparing police officers and civilian staff members. Using the job demands-control-support (JDCS) model as a theoretical framework, this study compared the impact of job characteristics for operational police officers and civilian police workers. Two self-report surveys were distributed (18 months lag) to employees from one Australian police service. The matched responses of 2,646 police officers and 1,170 civilian staff were compared in a series of MANOVAs. The moderating influence of job status (police officer versus civilian worker) in the prediction of psychological strain, well-being, turnover intentions and job performance was examined via multiple regression analyses. Police officers and civilian workers were found to differ significantly in their perceptions of organisational climate, job satisfaction, work engagement, coping, well-being and job performance. Police officers reported significantly higher levels of job demands and emotional dissonance, but significantly lower job control and supervisor support, than civilians. However, differences between police officers and civilians in neuroticism, colleague support and turnover intentions were not significant, and differences in psychological strain were marginal. Controlling for demographic differences between police officers and civilians, the effects of job control and supervisor support on psychological strain and well-being were found to be moderated by job status. However, job status did not moderate the effects of strain and well-being on turnover intentions or job performance. A significant three-way interaction between job demands, job control and job status was found when emotional dissonance was employed as the job demands measure. Police officers and civilian workers demonstrated substantive differences in their self-reported job characteristics and well-being, which were particularly evident in stressor-strain associations. However, job status did not influence associations between strains and organisational outcomes. Theoretical and practical implications for research with police populations are explored, including choice of theoretical framework, intervention design and evaluation, and organisational reporting.

**Occupation stress interventions in the high-risk industries: Achievable and successful**

**BROUGH, P. (Griffith University)**

The adoption of quasi-experimental research designs within ‘real world’ industries is commonly cited as being preferable, but too difficult to achieve; thereby justifying the adoption of descriptive cross-sectional research. This paper demonstrates that longitudinal research which includes control and experimental groups is in fact possible within two high-risk of stress industries: policing and corrections. The paper describes the design and results of two investigations each seeking to improve the occupational health of targeted samples of these employees. The advantages of a more considered research design for both the researcher and the partner organisations are discussed. Study One consists of a matched sample of 195 correctional officers who completed three self-report surveys over a three year period. Approximately half of these respondents had received an occupational
health training intervention. Study Two consists of a matched sample of approximately 500 police officers who completed two self-report surveys over a one year period. Approximately 100 of these respondents had received an occupational health intervention consisting of an organisational psychology component (supervisor training) and a physical health component (health promotion coaching program). The two investigations measured similar variables within each survey: job demands, job control, work engagement, support, job satisfaction, psychological strain, turnover intentions and work performance. Data were tested by both multivariate analysis (MANOVA, hierarchical multiple regression) and structural equation modelling and controlled for Time One criterion variables. The results for both studies demonstrate significant improvements over time for job satisfaction, psychological strain and work engagement, for the experimental groups in comparison with their respective control groups. This research demonstrates that longitudinal, quasi-experimental investigations are both achievable and successful among high-risk workers. The research also demonstrates the successful components of two occupational health interventions aimed at reducing stress and increasing well-being for police and correctional officers. The changes to working practices adopted by the two organisations in response to this research are discussed. The implications for improving the quality of reported occupational health psychological research are also discussed.

Keywords: occupational health, policing, corrections, high-risk industries, well-being

**Organizational culture and positive work environments**

Chair(s): PETITTA, L. (University of Rome "Sapienza")

Discussant(s): ASHKANASY, N. (UQ Business School)

This symposium will examine the role of organizational culture in shaping positive work environments and organizational effectiveness. Cultural underpinning is essential to managers’ ability to motivate individuals and groups towards positive outcomes, and to manage their organization’s social environment effectively. The aim of the session is to consider the status of theory and research in the organizational culture area and to discuss emerging directions for future research on key topics of organizational effectiveness and well-being. In line with this aim, the symposium includes one theoretical contribution presenting new issues and three papers outlining the findings of recent studies for future cultural research efforts to explore. The first paper reviews the findings relating to culture, with a main focus on the role of affective and emotional processes, and discusses three central cultural enablers of a ‘Positive Work Environment’: values in action; the shared norms leaders endeavor to enact among their employees; and employees’ organizational knowledge structures. The second paper outlines the findings of a multilevel study on how cultural dimensions affect employees’ perceptions of their context, their group and organizational collective efficacy, and both employee and organization oriented organizational effectiveness. In the third paper, the role of middle management commitment to change is investigated, with results from a eight years study suggesting that organizational culture and climate underpin organizational commitment during organizational change. The final paper addresses the relevance of catching organizational culture complexity for effective managerial action and intervention, by presenting findings on psychometric properties of a new combined typing and profiling measure of organizational culture, the Intensity and Strength Organizational Culture Questionnaire.
Overall, this symposium will relay the role of cultural dimensions in affecting employees’ effectiveness, well-being and commitment to their organization, and will call for research to examine how organization-level factors enable actions of organizational members, at the individual and group levels of analyses, resulting in effective and positive work settings.

Organizational culture and the shaping of a positive work environment

Understanding the cultural underpinning positive work environments is essential to managers’ ability to monitor and manage their organization’s social environment effectively. In this presentation, we argue that organizational culture is a key element of the work environment that determines the types and frequencies of affective events at work and their emotional consequences and subsequent effects on the actions of organizational members. We review the findings relating to culture in order to identify the cultural enablers of a ‘Positive Work Environment’ (PWE). We do this by considering three central elements of culture: values in action; the shared norms leaders endeavor to enact among their employees, and employees’ organizational knowledge structures. Organization values in action as enablers. We identify three key organizational values in action which underscore PWEs. The first is emphasizing individuals’ strengths and viewing negative behaviors as an organizational problem. Second is the encouragement and appreciation of positive emotional display and behavior. Third is the lived organizational value of justice and fairness. Shared norms as enablers. Organizations need norms to encourage some behaviors to occur and others to cease above and beyond that which formal rules and policies can prescribe. Whether norms are enabling depends upon whether they produce positive outcomes for individuals and groups in organizations or thwart them. Critical to establishing norms are the organizational leaders who shape these norms. We address in particular norms relating to emotional processes, in particular, how emotion eliciting events are interpreted and subsequently responded to. Employees’ organizational knowledge structures as enablers. Through interaction with and feedback from other organizational members and organizationally prescribed activities, employees gain, impart, and amalgamate knowledge of the organization and its culture. This then leads to knowledge networks that encourage all organizational members to take responsibility for ensuring a positive work environment. In concluding our presentation, we call for research to examine how organization-level factors shape, and are in turn shaped by affective processes at the individual and group levels of analyses, resulting in a Positive Work Environment.

Keywords: positive work environments, social environment, organisational culture, leadership, emotional processing

Collective efficacy, organizational culture and organizational effectiveness: Antecedents and consequences

ARKAN, S. (T.C. Okan University), SINANGIL, H. K. (Marmara University)

In terms of motivating their subordinates today’s managers are not only responsible for motivating individuals but the groups as well. Collective efficacy which means groups shared beliefs in groups’ capacities to accomplish a certain attainment is an important variable in motivational process, and previous studies denote its significant relations with groups’ performance. This study is concerned with both the antecedents and consequences of collective efficacy in the organizational settings. In this study the sample consists of 933 employees working in different organizations. The multiple regression analyses conducted at both individual and group levels showed that some organizational culture dimensions of Denison’s Organizational Culture Model and perception of context variables (top management, leader, group, and self efficacy of the employees) significantly affect group (GCE) and organizational (OCE) collective efficacy. Mission as a cultural dimension has the strongest effect on how the employees perceive their organization’s top management
(,.548, p: .00) and OCE (.609, p: .00). On the other hand, involvement dimension of organizational culture has the strongest effect on how employees perceive their colleagues in their work group (.451, p: .00) and GCE (.445, p: .00). Perception of group has the strongest effect on GCE (.681, p: .00), and perception of top management has the strongest effect on OCE (.581, p: .00). In terms of collective efficacy’s consequences organizational effectiveness was analyzed. In the multiple regression analyses conducted at the organizational level, it was found that all cultural dimensions of Denison’s Organizational culture model significantly affect OCE (F: 95.36, p<.05) and adjusted R2 of the regression analysis revealed that the changes in organizational culture dimensions explain 70% of the total variance in OCE. Moreover, involvement (.625, p: .00) and mission (.225, p: .00) dimensions of organizational culture’s have significant effects on employee oriented organizational effectiveness and mission (.623, p: .00) and adaptation (.225, p: .00) dimensions have significant effects on organization oriented organizational effectiveness. It was also found that OCE acts as a partial mediator between cultural dimensions of vision and involvement and employee oriented organizational effectiveness, cultural dimensions of vision and adaptation and organization oriented organizational effectiveness.

**Keywords:** collective efficacy, performance, organisational culture, organisational effectiveness, cultural dimensions

**The relationship between organisational commitment and organisational culture and climate and its influence on organisational change**

NAUGHTON, S. (The University of South Pacific)

Numerous studies have been conducted on the topics of organisational commitment, and organisational culture and climate over many decades. However, very few studies have empirically linked the three concepts, in particular to the process of organisational change. In this paper, I will focus on a study conducted on middle management commitment to organisational change and will attempt to show how organisational culture and climate influences the commitment of middle management. In particular, I will highlight and discuss the intertwined nature of organisational culture and climate that underpins organisational commitment during organisational change. While acknowledging the various studies and contributions on the topic, this paper will specifically focus on Turo’s conceptual framework on organisational culture, climate, and commitment. The study was conducted in a multinational company BHP (Billiton) over a period of eight years during which time the company underwent a radical transformation change including a reconceptualising of mission, vision leadership and culture change. A predominantly qualitative methodology was used within the interpretive paradigm. Organisational commitment is defined in the same way as in the studies of organisational climate and culture. Even though the term commitment is not used in the definitions, it is obvious that the idea of sharing values, goals and assumptions includes being committed to them. For example, Porter includes in his definition of organisational commitment a strong belief in and acceptance of the organisation’s goals and values. Likewise, other writer’s have described commitment in a similar way to that of organisational climate and culture. Turo argues that the concept of commitment can be best connected to that of organisational climate and culture and contends that “the strength of an organisational culture can be fruitfully analysed as the strength of commitment to an organisation”. Thus, Turo provides a conceptual framework of commitment linking organisational culture and climate. He takes a different approach to explain the bases of commitment. Instead of compliance, identification and internalisation, he uses the trichotomy of obligations, utilities and emotions. The finding of the study provides empirical support to Turo’s conceptual framework that specifically relates to middle management commitment to change.

The combination of typing and profiling measurement of organizational culture: Validation of the Intensity & Strength Organizational Culture Questionnaire

PETITTA, L. (University of Rome “Sapienza”), BARBARANELLI, C. (University of Rome “Sapienza”)

The study aimed at assessing the psychometric properties of a new combined typing and profiling measure of organizational culture, the Intensity & Strength Organizational Culture Questionnaire. It was developed in line with (a) Schein’s (1985) theory; (b) Enriquez’s (1970) typology of organizational cultures (autocratic, bureaucratic, paternalistic-patronage, technocratic, cooperative); and (c) Payne’s (2000) multidimensional model of cultural Intensity (which varies from attitude to deeply rooted belief) and Strength (how many people express a cultural feature). 770 Employees from different private and public organizations returned the I&S-O.C.Q. 59.4% of the respondents were men, average age was 38 years, average organizational tenure was 12 years. The 65 items self-report questionnaire measured five cultural typologies within thirteen cultural areas, among which the increasingly more studied areas of emotions management and employees’ well-being, identified from literature (Schein, 1992, 1999; Enriquez, 1970, Ashkanasy, Wilderom, Peterson, 2000). The answering scale was a two-parameter matrix of cultural intensity and strength. The total number of items (260) precluded to perform one single CFA. Five CFAs, one for each of the five cultures, were conducted to assess the structure of areas within culture and whether each item (attitude, behaviour, value, ingrained belief) loaded on the hypothesized factor (area). 13 CFAs, one for each of the 13 areas, were conducted to assess the structure of cultures within areas and whether each item (attitude, behaviour, value, ingrained belief) loaded on the hypothesized factor (culture). The five CFAs satisfied multiple goodness of fit tests (Hu, Bentler, 1999). The c2 across the CFAs were all significant ($p<.001$), the CFI ranged from .97 to .98, the TLI from .95 to .97, the SRMR from .24 to .34, and the RMSEA from .046 to .065. Overall, results supported the hypothesized factorial structure. The questionnaire allows the construction of a cultural profile for each of the 13 areas examined. Implications for intervention are discussed.

Keywords: psychometric properties, organizational culture, Intensity & Strength Organizational Culture Questionnaire, emotions, well-being
Organizational dynamics in entrepreneurship: Empirical evidence from China and Germany

Chair(s): WANG, Z. (Zhejiang University)

This symposium focuses upon emerging organizational dynamics in entrepreneurship on the basis of recent longitudinal empirical studies among small and medium-sized companies SMEs in China and Germany as well as studies on green entrepreneurship of new energy firms. The five presenters are active professors and scholars from both Germany and China who have collaborated in a number of empirical research projects on successful psychological factors in entrepreneurship among more than 350 Chinese companies and more than 350 German companies. Longitudinal data were collected from four different industries and cross-cultural research methods were further developed to test hypotheses about organizational dynamics in entrepreneurship process under globalization. The key learning objectives include: (1) an innovative methodology of shared construct development and cross-coding-validation is demonstrated through the four-year longitudinal cross-cultural comparative in-depth interview and questionnaire survey to provide learning for cross-cultural organizational psychology; (2) an organizational action model is put forward to enhance the understanding of action mechanisms for strategic entrepreneurship and its psychology; (3) both personal initiative and team initiative models are further developed to provide an integrated perspective in interpreting the dynamic interaction across levels of organizations and its effects on entrepreneurship performance; and (4) organizational dynamic capabilities are further studied through new industrial development and green entrepreneurship. Implications of organizational psychological research to entrepreneurship under globalization are highlighted in terms of new theoretical framework building and cross-cultural methodology (supported by DFG Germany and NSF China).

Organizational dynamics in entrepreneurship change and learning: A collaborative model

WANG, Z. (Zhejiang University)

This paper reports a cross-cultural collaborative research model in understanding the successful psychological factors and organizational dynamics in entrepreneurship in China and Germany. The focus will be on the interaction between entrepreneurial change and entrepreneurial learning. A longitudinal study was carried out among more than 350 Chinese small-and-medium-sized companies (SMEs) (average N=73) and more than 350 German SMEs (average N=13). In-depth interview and questionnaire surveys were conducted along two different data collection periods. An innovative method was developed to conduct shared progressive construct development and cross-coding-validation. The results showed that there are more cross-cultural similarities than differences in organizational dynamic factors in relation with entrepreneurship performance. Entrepreneurship change and learning are key elements for dynamic capabilities. The innovative method of shared construct development and cross-coding-validation was a powerful tool in effectively carried cross-cultural research. Entrepreneurship change and learning strategy are significantly linked with performance and sustainability.

Keywords: cross-cultural, entrepreneurship, entrepreneurial change, entrepreneurial learning

Action strategies in small business entrepreneurship in China and Germany

FRESE, M. (National University of Singapore)

The aim of this paper is to present main empirical research findings on action model framework for understanding the action strategies in small business entrepreneurship in China and Germany. This paper will also provide a general research framework for
discussing the recent research on organizational dynamics in entrepreneurship under globalization. A longitudinal study was designed and carried out among more than 350 Chinese small-and-medium-sized companies (SMEs) and more than 350 German SMEs. In-depth interview and questionnaire surveys were conducted along two different data collection periods. An action model hypothesis was tested. The action model could explain large proportion of variance from the cross-cultural comparison between Chinese entrepreneurs and German entrepreneurs. Further organizational and cultural dynamic factors of change and learning are noticed and explained in supporting the hypotheses. The Action Model Framework has its generalizability validity for the understanding of cross-cultural entrepreneurship behavior on the basis of longitudinal research. Implications are discussed in relation to further research on psychological process of entrepreneurship.

Keywords: entrepreneurship, China, Germany, longitudinal study, cross-cultural comparison

Personal and team initiatives in entrepreneurship in China and Germany

RAUCH, A. (Erasmus University), XUE, X. (Zhejiang Science & Technology University)

This paper aims at presenting the empirical research on the key organizational dynamic factors: personal initiatives and team initiatives in small business entrepreneurship in Chinese and German firms. The focus will be put upon the conceptual development of team initiatives on the basis of personal initiatives in relation to the entrepreneurship activities among different types of industries. A new dynamic model of initiatives will be presented. A longitudinal study was carried out among more than 350 Chinese small-and-medium-sized companies (SMEs) and more than 350 German SMEs. Pilot interviews and questionnaires were developed and conducted for measuring both personal initiatives and team initiatives. Additional data was collected to test the hypothesized model of team initiatives and relationship with entrepreneurship performance and team efficacy. Lisral modeling was built and alternative models were compared. The results showed that both personal initiatives and team initiatives were effective predictors for successful entrepreneurship in China and Germany. The two kinds of initiatives were more closely related to different levels of organizational dynamics in enhancing entrepreneurial performance. The key organizational dynamic factors are both personal initiatives and team initiatives in small business entrepreneurship among Chinese and German firms. The concept of team initiatives on the basis of personal initiatives has its stable dimensions and functions among different types of industries. The new dynamic model of initiatives has been demonstrated and implications are highlighted.

Keywords: personal initiative, team initiatives, entrepreneurship, longitudinal study, performance

Organizational dynamic capabilities in green entrepreneurship: An action perspective

LI, K. (Zhejiang University)

This paper aims at describing the organizational dynamic capabilities in green entrepreneurship using action model framework. It will present empirical evidence that the action model and organizational initiatives are the keys for success in emerging industries and green entrepreneurship. An in-depth multi-case method was developed and used in analyzing the key elements in using intellectual property strategy and progressive technology innovation under the framework of action planning and organizational initiatives. Specific scales were designed to measure green entrepreneurship orientation as well as action approaches and organizational initiatives. The results showed that the action model framework was effective in understanding new green entrepreneurship and relevant characteristics of organizational dynamic capabilities (ODCs). The ODCs are found to have close relationship with intellectual property strategy and progressive tech-innovation strategy and their performance. The organizational dynamic capabilities (ODCs) in green entrepreneurship were well based upon action model framework. The action model and organizational initiatives are the keys for the success in emerging industries and green
entrepreneurship. The ODCs are closely related with intellectual property strategy and progressive tech-innovation strategy and their performance.

Keywords: entrepreneurship, organizational initiatives, green entrepreneurship, performance, organizational dynamic capabilities

Organizational psychology confronts world poverty

Chair(s): MCWHA, I. (Massey University)

Discussant(s): REICHMAN, W. (Baruch College and the Graduate Center of the City University of New York)

Millions of people around the world in developed and developing countries are living in poverty. The reduction of poverty is the first United Nations Millennium Development Goal and thousands of individuals and hundreds of programs are working to achieve that goal with less than stellar success. Among those individuals are organizational psychologists who are working both at the applied “ground” level and at theoretical and research levels in an effort to bring the knowledge of our discipline to resolving this enormous problem. Four such people, representing many more involved organizational psychologists, are presenting their work and theories at this symposium. The first presentation will deal with the marginalized workers who are at risk of becoming unemployed and thus face barriers to their movement out of poverty. There are employees who are marginalized internally and externally and they are found in developed as well as developing countries. This presentation describes realistic steps for combating both types of marginalization. The second presentation will describe poverty alleviation programs in sub-Saharan Africa and its unintended consequences of promoting negative psychosocial outcomes such as depression and loss of self-efficacy. Data collected through a meta-analysis of poverty reduction programs strongly suggests that such programs must strengthen esteem and resilience in communities they serve. The third presentation will further examine the consequences of poverty reduction programs on those workers native to the country and those who are expatriates working in the program. Once again, there are unintended consequences that should be taken into consideration in developing such programs. The fourth presentation will deal with changes in the
Marginalization of the poor in and around organizations

MAYNARD, D. (State University of New York at New Paltz)

In this presentation, I will discuss how the poor are marginalized with respect to employment. Insufficient education and training are perhaps the greatest risk factors for unemployment or underemployment. Demographic variables such as gender, race, immigrant status, and single parenthood also affect the likelihood that someone will experience both poverty and employment difficulties. Those who are poor and without adequate means of making ends meet face social, economic, and organizational forces at both the market and organizational levels which serve as barriers to movement out of poverty. Being poor often means being restricted to employment that perpetuates the situation. Employment marginalization can be broken down into two forms. **External marginalization** comprises the ways in which the poor are unable to obtain quality employment which provides a living wage and decent benefits. Several sectors of the labor market rely on low paying jobs for those with limited education or training. Immigrants often experience poverty as a result of non-recognition of professional qualifications. Those below the poverty line are also unlikely to be connected to social networks that can result in opportunities for better employment or training. **Internal marginalization**, on the other hand, refers to ways in which the working poor are kept on the fringe of the organizations they work for. The lowest paying jobs have the fewest benefits, often do not offer support or flexibility for managing family responsibilities, and are especially prone to layoffs. They also tend to have relatively little chance for growth or advancement. A lack of power and access can lead to exclusion from the organizational community. Individuals holding such jobs are seen as expendable because of the minimal education and training required, and the large numbers of potential replacements. I will describe how the nature of work and organizations may affect the extent to which the poor experience inclusion or exclusion. Then, I will explain how theories from social and industrial-organizational psychology (e.g., social learning, organizational justice) apply to the problem of marginalization. Finally, I will describe some realistic steps we can take to combat both types of marginalization.

**Keywords:** marginalization, unemployment, poverty, immigrants, employment

Psychological aspects of poverty alleviation programs

MPOFU, E. (University of Sydney)

The symposium will examine the psychosocial effects of poverty alleviation programs, including sense of control, sense of community, and empowerment. Poor people are regarded as undesirable and are forced to live in marginal areas, informal settlements and shacks, where society ‘puts’ them ‘aside’. People living in such environments have to cope with disrespect, social exclusion, shame, and stigmatisation. Poverty creates disorganised living conditions, which expose poor people to multiple stressors and may affect their coping with stress negatively. Economic pressure has direct effects on elevated psychophysiological stress as well as on mental health. A meta-analysis of studies of psychosocial effects of poverty alleviation programmes in sub-Saharan Africa is the main method for this presentation. Articles for review include both white and grey literature and particularly contributed articles to a special issue of the Journal of Psychology on psychological effects of poverty (Vol 20, 2, 2010) and guest edited by the first and second authors. Preliminary findings suggest that
some poverty alleviation programmes designed for people in developing countries hardly focus on the psychological implications of poverty. Contrary to expectation, people of certain poverty alleviation programmes may be prone to psychological depression, and a loss of self-efficacy. They may perceive a lack of initiative, passivity, and apathy – characteristics that ensure that a person remains in poverty. The design of poverty relief programmes should include components to address the psychological effects of help-giving in marginalized communities. They should seek to strength the esteem and resilience of the host communities.

Keywords: poverty alleviation programs, poverty, help-giving, self-efficacy, social exclusion

Undermining poverty reduction work: Remuneration differences across six cultures

CARR, S. (Poverty Research Group, Centre for Psychology, School of Psychology, Massey University)

Despite the rhetoric of a single global economy, professionals in poorer countries continue to be remunerated differently depending on whether they are compensated locally versus internationally. Project ADDUP surveyed 1290 expatriate and local professionals (response rate =47%) from aid, education, government and business sectors in (1) Island Nations (Papua New Guinea, Solomon Islands), landlocked economies (Malawi, Uganda), and (3) emerging economies (India, China). Differences in pay were estimated using Purchasing Power Parity (PPP), calculated using the World Bank’s World Development Indicators 2007. Psychological measures included self-reported pay and benefits (remuneration), comparative ability, remuneration comparison, sense of injustice due to remuneration-related (de)motivation, thoughts of turnover and international mobility. We included control measures of candor, culture shock, cultural values (horizontal/vertical individualism/collectivism), job satisfaction and work engagement. Controlling for these and country (small effects) and organization effects (medium), (a) international: local pay ratios exceeded psychologically and materially comfortable thresholds among respondents remunerated locally; who also reported a combination of relative (b) injustice and (de)motivation; which (c) together with job satisfaction/work engagement predicted both turnover and international mobility. These findings question the wisdom of dual salary systems in general, expose and challenge a major contradiction between contemporary development policy and practice, and have a range of implications for poverty reduction work.

Keywords: remuneration, job satisfaction, work engagement, poverty, poverty reduction

A revised theory of economic growth

FRESE, M. (National University of Singapore)

In 1984 Harry Triandis wrote an article on psychological theory of economic growth. So it makes sense 26 years later to see where we stand with regard to his theory. I would like to present a speculative summary of what psychological contributions exist for a theory of economic development. Similarly to Triandis 1984 I will ask the question how culture and the difficulty of resource extraction have an influence on how we organize work and how we develop organizations. However, in contrast to Triandis I will also talk much more about the issue of how we start new organizations and how we innovate. In this way it becomes a much more entrepreneurship-oriented theory. In contrast to the theorizing that was done by Triandis in 1984 there is now also a greater wealth of empirical data that can be used to understand the relationships with economic wealth and economic development.

Keywords: economic growth, economic development, culture, resource extraction, economic wealth
Personal vs environmental factors in adjustment to life crises

Chair(s): MURPHY, G. (La Trobe University)
Discussant(s): ANDRASIK, F. (University of West Florida)

This symposium examines the relative contribution of “personal” as opposed to “environmental” factors in the development and maintenance of problem behaviours and/or effective coping with major life crises. Much research in applied psychology concentrates on attributes of the individual and the contribution of these attributes to performance in various settings. This symposium brings together a group of researchers interested in people’s adjustment to major life crises and in the relative contribution to various indices of adjustment made by both “individual” and “environmental” variables. Typically multivariate data analytic techniques are used to identify the effect sizes associated with variables from both groups of factors. Problem area examined range from coping with problem gambling to returning to work following traumatic injury. Key theoretical frameworks involved in the synthesis of study findings include those from behavioural, ecological and social psychology (such as Ajzen’s Theory of Planned Behaviour and Bronfenbrenner’s model of human development). The symposium, which will be comprised of four papers that address the relative contribution of “personal” and/or “environmental” factors in outcomes achieved, will be Chaired by Associate-Professor Greg Murphy, from the School of Public Health, La Trobe University. The Invited Discussant will be Professor Frank Andrasik, University of West Florida. Participants in the symposium will learn about particular individual as well as environmental variables that are associated with successful adjustment to the life crises studied. Within the set of identified correlates of successful adjustment there will be special examination of malleable factors involved in the development of, or response to, life crises. These malleable factors have obvious implications for those applied psychologists interested in service delivery (both preventive and remedial services). Attendees will also be introduced to effect size measures used in multivariate studies of adjustment to life crises.

The contribution of injury, demographic and environmental variables to employment achievements one year after traumatic spinal cord injury rehabilitation

MURPHY, G. (La Trobe University)

The aim of this study was to indentify the contribution of injury, demographic and environmental variables to reported employment status, at 12 months post discharge from rehabilitation following traumatic spinal cord injury. Participants were 72 patients discharged from a Sydney, Australia, Spinal Cord Injury Rehabilitation facility. Patients were assessed at discharge on a range of injury, demographic and environmental variables and then followed up 12 months later to identify their employment status. Predictor variables (10 in total) included two injury-related variables, four demographic variables and four environmental variables. Complete sets of data were available for 60 participants. Logistic regression was the main data analytic technique used to identify the individual and combined ability of predictors to identify those subsequently employed. Twenty were employed at follow up. Three independent predictors (p<.05) of the employment criterion were identified: one injury variable (functional independence at rehabilitation discharge); one demographic variable (pre-injury skilled occupation); and one environmental variable (score on community integration). Good classification accuracy was achieved (87% overall), and in combination, the set of predictor variables explained an encouraging 44.7% of criterion variance. In spite of a relatively low (27%) post-discharge employment rate, study results with respect to functional independence confirmed the traditional importance of physical rehabilitation services for improving patients’ chances of gaining subsequent employment. Pre-injury occupation was also confirmed as a predictor of post-injury employment. One of
the rarely-studied environmental variables (community integration) played a significant role in influencing post-injury employment. While the stability of the obtained results needs to be established, the results from the scores on the Community Integration Measure have identified social support services as potentially a valuable service to be strengthened within spinal cord injury rehabilitation programs.

Keywords: injury, demographic variables, environmental factors, employment, rehabilitation

Utilizing cluster analysis to profile successful return to work following an industrial accident

WILKS, R. (International Medical University)

The aim of this study was to examine which variables would improve the prediction of return to work (RTW) status among 43 workers who had experienced a work injury. Participants included 43 injured workers who had been referred for occupational rehabilitation after an industrial accident. Demographic and injury-related predictor variables included age at injury, gender, occupational type, type of injury, time involved in occupational rehabilitation, and the time from injury to referral to occupational rehabilitation. Attribution predictor variables included internal/external, stable/unstable, and global/specific. A Regression Analysis of RTW determined that the following variables accounted for 56% of the variance: specific-global attributions; timely provision of rehabilitation services; age of injured worker; and internal-external attributions. A Cluster Analysis utilizing the three attribution dimensions determined profiles of workers who successfully RTW. A post hoc qualitative and quantitative analysis of key factors for each profile was explored. It was concluded that rehabilitation professionals should focus on the importance of modifying distorted attributions and ensuring timely referrals.

Keywords: prediction, return to work, work injury, occupational rehabilitation, industrial accidents

Return to work expectations: Their formation and influence on return to work post injury

CANTY, J. (Swinburne University of Technology), YOUNG, A. (Disability Research Center, Liberty Mutual)

A conceptual review of the rationale underpinning a program of research investigating both theoretical and empirical aspects of return-to-work (RTW) expectations will be presented. Following a review of the return to work literature, three foci for research projects within the research program are described: Study 1 focuses on defining and measuring RTW Expectations; Study 2 asks the question ‘Why do RTW expectations relate to RTW outcomes?’ And Study 3 involves an investigation of RTW Expectations Formation. Available results will be presented and discussed in terms of the relative influence of expectations (as opposed to other personal and environmental variables) on return to work following occupational injury.

Keywords: return to work, work injury, expectations, personal factors, environmental factors

Using an ecological approach to identify the antecedents of problem gambling

JACKSON, M. (RMIT University)

The aim of the research was to identify the determinants of problem gambling in Australia. The areas of interest were: demographic, psychographic, contextual and ecological variables. This study used a survey method on the general population (N = 1408) and used the Southern Oaks Gambling Screen (SOGS) to determine probable pathological gamblers. The overall predictive validity of the measured antecedents was $r^2 = .822$ for gambling behaviour and $r^2 = .812$ for probable pathological gambling behaviour. The main contribution to the explained variance was contextual and ecological variables. From a theoretical point of view, the notions of participation and activity within gambling and the five Bronfenbrenner ecological systems provided the best explanation re the causes of problem gambling. It was concluded that to
implement effective interventions with probable pathological gamblers, psychologists should focus on the contextual and ecological determinants of problem gambling.

Keywords: problem gambling, determinants, demographic variables, contextual variables, ecological variables

**Personal, professional and political: Applications of feminist ethics to research and practice**

Chair(s): GRIDLEY, H. (Australian Psychological Society)

Discussant(s): ALVAREZ WICKLEIN, R. (RMIT Counselling Service)

This symposium critically examines ways in which feminist principles, values and ethics can and have been applied to psychological theory, research and professional practice, and beyond to public policy and social activism. Guiding questions and related learning objectives across the four papers include: In what ways is social justice advanced by the development of gender-specific ethical guidelines and policies in psychology? What lessons might be learned from the historical accounts presented here of the development of such guidelines and policies? How much scope exists within psychology for the application of feminist principles, values and ethics? Is social activism really ‘beyond psychology’, or can our ethical codes, standards and practices be enriched by learnings from social movements? The first paper reviews the evolution of Canadian Guidelines for Ethical Psychological Practice with Women over the past 35 years, noting how gender inequality has been variously enacted and addressed across that period. The second paper offers a parallel overview of the development since 1990 of equivalent Australian ethical guidelines, drawing a comparison with the politics and processes associated with the concurrent emergence of another set of guidelines that have gendered implications. The third paper provides a critical analysis of the development and adoption by the Psychological Society of Ireland of a comprehensive policy on equality and inclusive practice, and considers why some dimensions of diversity received more attention than others in the implementation of the policy. Reaching beyond psychology and the academy to the domain of social activism, the
fourth paper examines the emergent ethics of the Pakeha Treaty movement in New Zealand. The author argues that feminist praxis and research helped to challenge traditionally accepted principles and norms for ‘good research’ in psychology, and that both were in turn challenged by a deeply rooted collective ethic developed in the Treaty movement. Taken together, the four papers across four post-colonial Western countries invite shared reflection on ethical decision-making in relation to gender equality and other dimensions of social justice.

The Canadian experience in the evolution of guidelines for ethical psychological practice with Women

PETTIFOR, J. L. (University of Calgary)

This paper reviews the evolution of Guidelines for Ethical Psychological Practice with Women from the 1975 United Nations Year of Women to the present time. The focus is on Canadian psychology. The content of significant documents, events, literature, and changing attitudes were reviewed with a view to identifying whether there was a need for updating the Guidelines. In the period of time under consideration there appeared to be an increase in the general acceptance of diversity, a decrease in overt sexist practices, and more subtle insensitivity or resistance to treating women with equality. The emphasis on proving that sexist practices exist gave way to addressing how to address women’s issues of fairness and equality. Guidelines for psychological services for women need to be reviewed and updated on a regular basis. Guidelines need to be incorporated in all aspects of practice, such as professional education, continuing competence, standards for accreditation, supervision and research.

Keywords: ethics, women, Canada, sexism, equal opportunities

Squeaky doors and the politics of ethics: Developing Australian guidelines for psychological practice with women

GRIDLEY, H. (Australian Psychological Society), NORTHFIELD, S. (Victoria University)

To present a historical overview of the development, eventual adoption and subsequent review by the Australian Psychological Society of a set of ethical guidelines for psychological practice with women. The guidelines were first suggested in 1990 by individual psychologists and by groups such as the Feminist Therapy Collective, following similar developments in Canada and the USA a decade earlier, but were not approved until 1996. Further revisions have since been made as part of a cyclic review process applied to all APS guidelines. A document analysis outlines the extensive consultation processes as well as institutional obstacles that formed a subtext to the evolution of the original guidelines and subsequent revisions. A comparison is offered with the processes that led to the development in 1994 of a set of Guidelines for the Reporting of Recovered Memories in the context of worldwide controversy surrounding the concept of ‘false memory syndrome’. The paper elucidates the respective rationales for the development of both sets of guidelines, with reference to the politics and processes of disciplinary stasis and change. This historical investigation reveals ‘good news and bad news’. A direct outcome of the debates surrounding both sets of guidelines was the establishment of the APS Ethical Guidelines Committee which has overseen the development and review of all of the Society’s ethical guidelines since 1998. A new Code of Ethics in 2007 incorporated terms such as ‘respect’ and justice’ as core principles for the first time, but their operationalisation remains a somewhat contested work in progress. The paper concludes with consideration of the relationship between ethical guidelines and standards or codes of ethics, their value as educative tools, and some lessons learned from this twenty-year saga. And a final question is raised: whatever happened to the Feminist Therapy Collective?

Keywords: ethical guidelines, women, feminism, feminist therapy collective, codes of ethics

Developing a policy for equality and inclusive practice: the Irish experience
MOANE, G. (University College Dublin)

The aim of this paper is to provide a critical analysis of the development of a policy on equality and inclusive practice by the Psychological Society of Ireland (PSI). This analysis includes firstly identification of specific historical and contemporary aspects of the Irish context that have created an unusual combination of equality awareness and policies, prejudice, and unique patterns of immigration and ethnic diversity. The presentation draws on documentary analysis to chart the development of the policy and its implementation. The findings show that the policy is comprehensive and broad in scope, and was quickly adopted by the Council of the PSI. A more detailed analysis of implementation following adoption of the policy shows that gender received very little attention, while sexual orientation and ethnic diversity attained considerable profile. This presentation considers why this was the case.

**Keywords:** equal opportunities, Ireland, immigration, ethnic diversity, gender

Does a social movement require higher ethics than the academy? Following feminist and anti-racism movement ethics for rich research outcomes within and beyond psychology

HUYGENS, I. (University of Waikato and Waikato Institute of Technology)

The Pakeha Treaty movement is a social movement of primarily white women challenging racism and colonialism in New Zealand. Groups of activist educators formed throughout the country during the 1970s and 1980s. Today, they continue their work of strategic education about the Treaty of Waitangi, the original agreement for settlement. The ethics of the movement drew upon feminist praxis and research, including a commitment to transparent collective theorising, practice and accountability. The aim of this paper is to explore how my doctoral research intersected with these ethics, and challenged traditionally accepted principles for ‘good research’ in psychology, such as confidentiality, anonymity and individual self-reflection. This paper presents the processes developed as I recorded the theorised practice of 10 Treaty educator groups. I positioned myself as an insider Treaty educator remaining accountable to the ethics of our social movement, and responded to challenges from participants for transparent, shared interpretations that would reflect ‘the work of many others’. This necessitated revision of consents to allow identities and authorship to be known and acknowledged at a national level. As a result, an innovative method of visual and verbal theorising between successive groups developed, culminating in a national sharing of our contemporary practice. The new method deepened the movement’s collective knowledge and led to useful educational resources – a series of visual theories published in a book and a DVD/video. By following stringent ethics for collective accountability and transparency developed by feminist and anti-racism social movements, I obtained significantly richer research outcomes than had I followed more traditional research ethics. Feminist praxis and research helped to challenge academic norms, and both were in turn challenged by a deeply rooted collective ethic developed in the Treaty movement. I will discuss implications for the researcher purporting to explore ‘new’ knowledge relating to women and psychology.

**Keywords:** New Zealand, ethics, Pakeha Treaty movement, women, racism
Personality and situational influences on political attitudes

Chair(s): HUDDY, L. (Stony Brook University)

The goal of this symposium is to examine the origins of political attitudes in stable enduring influences such as personality attributes and compare this with the influence of situational factors such as environmental threat, or new information about a political actor. The speakers include a number of internationally prominent political psychologists who will discuss foundational theories of political psychology including the affective origins of political attitudes, the political effects of personality traits, and political information processing. Papers will discuss the application of these theories to a diverse array of political attitudes including support for immigration policy, policies designed to ameliorate racial inequities, support for specific political candidates, and attitudes towards political institutions. The sessions’ key learning objectives include understanding factors that promote stability and change in political attitudes, seeing how psychological theories can be applied to political attitudes, and shedding light on the dynamics of public opinion. The first presenter will provide an overview of the emotion system and explain how emotions dictate whether political attitudes and behavior are habitual or respond to ongoing events. He will provide examples of the way in which emotional reactions dictate whether voter decision making in U.S. presidential elections depends on stable partisan affiliations or responds to specific campaign events and information. The second presenter delves more deeply into the stable origins of political attitudes by examining the impact of big-five personality factors on attitudes toward different kinds of immigrants to Australia. The third presenter examines stable prejudicial sources of white opposition to racial policies in the U.S. and contrasts this with other racial attitudes that also drive policy opinions but are rooted less in prejudice than ongoing assessments of discrimination in US society. Finally, the fourth presenter examines the degree to which Cypriots respond to negative information about a political body (in this instance a water authority) based on their prior views of it, and then examine the degree to which this reactivity to negative information shapes their willingness to comply with regulations issued by the authority.

The theory of affective intelligence: A primer and applications

MARCUS, G. (Williams College)

This paper provides a brief primer on the theory of affective intelligence and reviews its application to politics. The theory of affective intelligence is a "dual process" model. It posits that people have two distinct approaches to judgment and behavior: 1) reliance on habits or what Bargh calls "automaticity"; and, 2) reliance on explicit thoughtful considerations. It differs from other such dual process models in that both stages depend on preconscious affective appraisals that produce distinct emotions. It differs from other theories of emotion by relying on a dimensional structure of emotion (as contrasted with discrete structural models) and by asserting that the primary functions of emotion are preconscious, thus altering the fundamental link between affect and cognition from spatial (e.g., peripheral v central, subconscious v conscious) to temporal (before and after). A review of theories and recent research findings on the link between affect and political decision making processes. Among the principal findings are that anxiety affects attentional focus by increasing political attention in general, and especially to threatening stimuli; reduces reliance on political heuristics such as ideology and partisan identification; and is linked to a deliberative mode of citizen reasoning. A review of these findings in and during political campaigns and outside of the campaign periods is given as well. A summary review of its current state of development is also offered.

Keywords: affective intelligence, politics, decision making, habits

Immigration attitudes as a function of big-five personality traits

BOLDERO, J. (Melbourne University)
Australia is a country of migrants. In 2006, only 2.4% of the Australian population was Indigenous Australians and 44% were either born overseas or had at least one overseas-born parent. Furthermore, despite relatively high levels of migration, racism and negative attitudes toward migrants are relatively prevalent (e.g., Pedersen & Walker, 1997). However, research has treated migrants as a homogeneous group and focused on group-level predictors of these attitudes (e.g., nationalism). The present study was designed to examine whether (1) attitudes toward a range of migrants are heterogeneous and (2) the individual and group-level predictors of these attitudes. Participants were 280 students (209 females) who were either Australian-born in Australia or had lived in Australia for at least five years. They indicated how many migrants from 13 different migrant groups (e.g., migrants from the Middle East, refugees, and skilled migrants) should be allowed to migrate to Australia, relative to current levels. They also completed measures of the ‘Big Five’ personality factors and nationalism. Exploratory factor analyses yielded three correlated factors: attitudes toward skilled and culturally dissimilar migrants, and refugees. No factors predicted attitudes toward skilled migrants whereas attitudes toward culturally dissimilar migrants were positively associated with openness and agreeableness (Step 1), and positively associated with agreeableness and negatively associated with nationalism (Step 2). Attitudes toward refugees were positively associated with neuroticism and agreeableness (Step 1) and with these factors and negatively associated with nationalism (Step 2). Australians do not view migrants as a homogeneous group. Rather, they differentiate between those who are skilled, those who are culturally dissimilar, and those who need help and protection. Furthermore, although all appear to see the value in allowing the migration of skilled individuals, it is those who are more open to experience and agreeable who have more positive attitudes toward the culturally different. Further, although the impact of openness is mediated by nationalism, this factor does not mediate the impact of agreeableness or neuroticism. Together, the results indicate that it is important to consider individual-level factors along with group-level ones when understanding attitudes toward different migrant groups.

Keywords: immigration, big-five personality traits, racism, attitudes, nationalism

Beyond prejudice: The structure of white racial attitudes

CAPELOS, T. (University of Surrey)

The role of racial prejudice in driving white racial policy opposition has been the subject of a prolonged debate among researchers of American race relations. But racial attitudes may reflect more than simple prejudice, and indeed we argue are multi-dimensional. We develop a tripartite system of racial attitudes that begins with overt prejudice, beliefs linked to a view of inborn black inferiority that has been prematurely dismissed as politically irrelevant. We further decompose white racial beliefs into two additional components that underlie racial resentment: The denial of racial discrimination in contemporary American society, and the belief that blacks lack motivation and values needed to get ahead. These two dimensions correspond roughly to an external and an internal explanation for a lack of black success and have been noted by other race researchers. The current paper is designed to test the validity of this proposed structure. We draw on data from the American Racial Opinion (ARO) survey conducted as an RDD telephone interview of U.S. residents from October 23, 2003 until February 23, 2004. Analyses are based on data from all white, non-Hispanic, non-Asian respondents (N=1,229) drawn form a total of 1,583 respondents overall. Using original national survey data and a new battery of race-related items, we show that this three dimensional structure captures well the variation in Americans’ attitudes towards the origins of racial inequality in economic and educational outcomes. Contrary to current measures of racial resentment in which internal and external explanations for racial inequality are inextricably linked, we find virtually no relationship between whites’ denial of racial discrimination and the view that blacks lack the motivation to get ahead. There is, however, a substantial correlation...
among whites between belief in a lack of black motivation and overt prejudice. We then show that this three dimensional model accounts for a broad range of other measures of racial attitudes including racial resentment and racial stereotyping. We conclude by demonstrating the utility of this model for understanding whites’ racial policy positions.

Keywords: prejudice, racial attitudes, white racial policy, denial, inequality

Institutional reputations, citizens’ evaluations, and scandal impact

FELDMAN, S. (Stony Brook University)

This paper has several aims. First, it investigates the degree to which prior reputation mitigates the effect of a scandal on a political institution (in this instance a water authority). Past research has documented that a prior reputation for competence helps an individual politician to weather a scandal better than a reputation for integrity. The paper examines whether such prior beliefs have a similar effect on the reputation of a political institution. Second, I examine the consequences of an institution’s reputation on citizen compliance with its regulations. I thus test the following hypotheses: (1) a positive institutional reputation determines whether citizens comply with its recommendations and policy proposals; and (2) the effects of a prior reputation for competence protects against a scandal more effectively than an honest reputation. The blame management literature suggests that competence reputations of candidates are more resilient than integrity reputations. I test these hypotheses with two nationwide surveys conducted in Cyprus in the spring and fall of 2009. Specifically, I examine the reputation of the Water Authority agency before and after a scandal. I examine the ingredients of the institutional reputation before and after the predicament and measure citizen compliance to the water authority’s recommendations concerning water conservation. I find that the authority’s perceived competence and integrity have differing effects on level of compliance with water conservation regulations and with levels of satisfaction with the political process more generally. This political psychology study fills a significant gap in the literature on the determinants of institutional reputations and their impact on citizens’ behaviour.

PhD Programmes from students’ perspectives

Chair(s): SAGANA, A. (Maastricht University)

The continuously increasing demands of working labour and the constant internalization of working context at an international level have contributed to the increasing number of students who are looking for a higher level of education. Masters, nowadays, is considered as basic qualification of a well-trained psychologist. Developments regarding the psychologists training as for example the Bologna Process and the creation a European Higher Education Area (EHEA) by 2010 to promote the European system of higher education worldwide brings universities and students in front of an era of change. Students interested in proceeding towards a PhD, meticulously examine the different programmes and many of them are ready to leave their countries in the chase of a high quality programme. But how similar are PhD programmes around the world? Is it worth the effort? If yes, what are the requirements? In order to answer all these questions we asked universities, holding PhD programmes in psychology, from all over the world to indicate what are the most important requirements for a successful PhD student. What is more, grant options and job opportunities have been under our scope of research. Academic mobility, prior and after the successful completion of a PhD, will be discussed.

Carrying out a PhD in Europe

POTOCNIK, K. (IAAP, Student Division President)

Before the reforms in higher education systems in European countries took place (that led to the implementation of European Higher Education System), PhD programs were substantially different across European Countries. For instance, in Spain PhD programmes included one year of obligatory course work, focused toward the acquisition of specialised knowledge and research skills. In contrast, in Germany or the Netherlands no such courses have been obligatory. With the Bologna system that sets a Master degree as a minimum level of education for professional practice (60 ECTS) and a requirement for pursuing a PhD, obligatory course work in the beginning of the PhDs has been abolished in Spain and other European countries. This presentation will address differences and similarities of the PhD programs between European countries. Moreover, we will present funding options for carrying out a PhD research as well as for academic mobility.

Aspects of America. North and South: How similar, how different

PENA, M. (Universidad Nacional Mayor de San Marcos), HASAN, N. (University of Houston-Downtown)

This program is part of a larger symposium about doctoral training in psychology from around the world. This specific presentation covers the process of earning a doctoral degree in psychology in North and South America. There are significant differences in psychology training in North and South America. First, we will discuss the training process in South America, with a discussion about doctoral level training. Doctoral level education is not the norm for psychology training in South America, and we will discuss the benefits and limitations to this level of training. Next, a discussion about doctoral training in North America will be discussed with a focus on doctoral level training. Doctoral level training is the minimum required degree for individuals who wish to be called “psychologists” and practice in North America, specifically in the United States of America. We will discuss the standard undergraduate requirements, general admission requirements to a graduate program, program accreditations, and program specialization. Finally, a discussion about the similarities and differences in psychology training in North and South America will be provided.

Keywords: doctoral training, psychology, America, specialization, program accreditations
Carrying out a PhD in Australia

CLARKE, K. (Monash University)

The PhD was first introduced in Australia in 1948. Since the 1990’s there has been a growth spurt in the number of students undertaking PhD’s, particularly in the Health Sciences area. As a result there have been changes in the traditional PhD rules to accommodate new professional specialties, including ways that research can be carried out, and new ways of presenting theses (i.e. thesis by publication). Further, in the 1990’s professional doctorate programs were introduced by Australian Universities to accommodate the need for a combination of professional coursework and a substantial research thesis. Entry into PhD programs in Australia is competitive, with a requirement of a first class honours in most cases. Australian-citizens and other eligible PhD students in Australia are not charged course fees as these are paid for by the Australian Government under the Research Training Scheme. PhD students are sometimes offered a scholarship to study for their PhD degree. The most common of these is the government-funded Australian Postgraduate Award (APA), which provides a living stipend to students of approximately AU$ 20,000 a year (tax free). Most universities also offer a similar scholarship that matches the APA amount, but are funded by the university. In addition to the more common APA and University scholarships, students also have other sources of funding in their PhD degree such as scholarships offered by schools, research centres and commercial enterprise. The aim of this presentation is to present results of a survey of Australian Universities that offer a PhD program in psychology with regard to requirements of entry, PhD student attributes and funding opportunities. Further, academic mobility prior to and after the successful completion of a PhD at an Australian University will be discussed.

Positive and negative aspects of adolescent relationships:
Attachment and aggression as influential forces

Chair(s): WILKINSON, R. (The Australian National University)
Discussant(s): MOORE, S. (Swinburne University)

The APS Psychology of Relationships Interest Group encompasses active researchers and practitioners who have relationships as a central concern of their work. This symposium focuses on presenting research from members of this group who are particularly interested in understanding both the positive and negative aspects of emerging adolescent relationships. The first two papers report on individual differences and normative aspects of attachment in adolescence. The first paper reports on the applicability of the dominant self-report assessment approach to individual differences in attachment for adolescents and young adults. Support is found for the two factor model of anxiety (hyperactivation) and avoidance (deactivation) although concerns are raised about how this relates to assessing attachment in particular relationships. In the second paper the presenters map out differences in the normative aspect of attachment transfer in adolescents by examining the attachment networks and how different aspects (or functions) are fulfilled by different members of the network. Support is found for the transfer hypothesis in that peers, and particularly romantic partners, take on increasing importance from an attachment perspective. In the next two papers the importance of both peer and romantic relationships for adolescence are highlighted. The presenters examine relational aggression and victimization in adolescents and their peers and how these are related to adjustment. They find that while aggression may have some ‘pay-off’, both relational aggression and victimization, particularly when isolating, still have negative consequences. In the final paper the presenter
Abstracts of the 27th International Congress of Applied Psychology

Symposia

Demonstrates how an intervention aimed at abuse in adolescent couple relationships may be beneficial. Relationships early in adolescence can set the pattern for later relationships and by intervening early with relationship assertiveness skills training it is hoped that the cycle of abuse may be broken. The key learning objectives from this symposium are: (1) to better understand the nature of both individual differences and normative attachment representations in adolescence and the emerging importance of peer and romantic relationships, and (2) to appreciate how relational aggression and victimization effect adolescent adjustment and how interventions aimed at this age group can have benefits at both personal and social levels.

Development of a general short-form of the Experiences in Close Relationships – Revised questionnaire to assess attachment in adolescents and young adults: A multi-sample study

WILKINSON, R. (The Australian National University)

The 36-item self-report questionnaire Experiences in Close Relationships – Revised has emerged as a widely used tool to assess individual differences in attachment anxiety (hyperactivation) and avoidance (deactivation) in samples of adults with romantic relationship experience. However, both the length of the instrument and its reference to experiences with romantic partners limit the extent to which it can be employed with younger individuals. This paper reports the results from two studies evaluating a new general, short form (20-items) of the ECR-R, the ECR-R-GSF, which has had items modified to refer to relationships in general. In study one the factor structure and convergent validity of the ECR-R-GSF is investigated with 694 high school and college students aged from 14.5 to 22.9 years. In study two the structural model was assessed with an independent sample of 493 high school students aged from 11 to 19 years. Confirmatory factor analysis supports a two factor structure and convergent validity of the ECR-R-GSF. The factors relate appropriately to the Relationship Questionnaire (Bartholomew & Horowitz, 1991) dimensions and categories. The ECR-R GSF dimensions were found to have moderate correlations with the Inventory of Parent and Peer Attachment – Peer scale (Armsden & Greenberg, 1987) but weaker correlations with the Maternal and Paternal Attachment Scales. The factor loadings and variances were found to be invariant across the samples. Multi-group analyses for the combined samples demonstrated that the model was consistent across age and gender. Overall, the results indicate that the ECR-R-GSF is a potentially efficient and appropriate way to assess trait attachment hyperactivation and deactivation in adolescents and young adults. Importantly, the results indicate that there may be major differences between these constructs and specific attachment relationships as assessed by instruments such as the IPPA. The need to consider different levels of attachment abstraction in adolescence is discussed.

Keywords: close relationships, attachment, adolescents

Attachment reorganization in adolescence: Straight-forward or complicated?

GOH, D. (The Australian National University)

The purpose of the present study is to examine the processes of attachment reorganization in an Australian adolescent population. Attachment reorganization is a normative developmental process which chronicles adolescents increasing orientation towards their peers, such as friends or romantic partners, for the fulfillment of attachment functions. By late adolescence it is argued that a romantic partner usually replaces parents at the top of the attachment hierarchy, and becomes the primary attachment figure for the individual. Attachment reorganization has been found to vary accordingly with age, gender, the presence (or absence) of a romantic relationship, and even with attachment functions themselves. This study also aims to identify individual similarities and differences in the process of attachment reorganization amongst Australian adolescents. Self-reported attachment to mothers, fathers, friends and romantic partners of cohorts of early adolescents (109 females and 74 males) and late adolescents (239 females and 90 males) is examined in a cross-sectional study using the
modified Attachment Network Questionnaire (Doherty & Feeney, 2004). Results of two, mixed-design Analysis of Variance (ANOVA) procedures are consistent with the process of attachment reorganization in adolescence, with adolescents’ preferences for specific attachment targets differing according to attachment functions, their age, gender, and romantic status. Adolescents increasingly orient towards peers, and away from parents for attachment needs as they age, with this process facilitated by the presence of a romantic relationship. The increasing importance of the romantic partner as an attachment figure is correspondingly demonstrated. Adolescent females also show greater preference for friends as targets while adolescent males turn to their fathers, particularly for the attachment functions of Safe Haven and Secure Base. Although attachment reorganization is a normative developmental process which occurs in a chronological and sequential fashion, there are inherent complexities in the form of individual differences which can facilitate or impede its movement. It is imperative for future research to account for both the normative and individual differences in attachment to provide a more holistic view towards understanding attachment in adolescence. Clinical applications for understanding the implications and effects of attachment reorganization are discussed.

Keywords: attachment, reorganization, adolescence

The socioemotional problems, social prominence and motivations associated with relational aggression, connected victimization and isolated victimization

PRONK, R. (Griffith University)

Despite recent research on relational aggression (RA) and relational victimization (RV), questions still exist regarding how RA and RV can be associated with good behaviours and high status among peers at school at the same time that they can be detrimental to mental health. In the current study, RA and two types of RV were examined to assess their independent and unique associations with adolescents’ socioemotional functioning, social standing and motivations for aggression. Participants were 335 adolescents (9 - 15 years; 53% girls) who reported who among their school peers was aggressive and victimised using nomination techniques. Each student completed questionnaires about their own RA, RV, depressive symptoms, social anxiety, peer social standing, perceptions of exclusion, and social motivation (i.e., dominance & affiliation). Factor analyses identified 2 forms of RV: connected (i.e. centre of peers, being ‘spoken about’) and isolated victims (i.e. rejected from peer group). RA and both RV forms were associated with more depression and anxiety, with strongest associations with isolated RV. RA was more strongly linked with girls’ than boys’ depressive and anxiety symptoms. Perceptions of peer group exclusion and distrust mediated associations between RV and mental health symptoms. Those who were aggressors and higher in connected RV were more socially prominent, but those higher in isolated RV were lower in social prominence, more rejected and unpopular. Adolescents who self-reported more RA had more dominance motivations, those higher in connected RV reported fewer affiliation motivations, and those higher in isolated RV reported more dominance and fewer affiliation motives. RA and both forms of RV have negative implications for adolescents’ socioemotional functioning, but RA and connected RV also are accompanied by peer social prominence; it is isolated RV that seems most detrimental to mental health, seeming particularly problematic for girls. RA may be a method that some adolescents, rely on to maintain/gain social prominence in the peer group; however functioning appears to be compromised in the process. Motivations for affiliation may be lower because adolescents have experienced RV regardless of whether they are connected or isolated victims. Application of findings will be discussed.

Keywords: relational aggression, victimization, adolescents

Efficacy of skills-training for increasing adolescent girls’ propensity to resist abusive couple dynamics
Abusive couple relationships are associated with adverse outcomes for the partners involved and for children exposed to the abuse. Preventing chronic partner abuse requires a complex mix of interventions which address individual through to societal risk factors. It has been argued that interventions for adolescent girls beginning to engage in couple-relationships are important to include in this mix. This paper presents the evaluation results of a group-based training program designed to reduce adolescent girls’ vulnerability to chronic partner abuse by increasing their motivation, skills, and self-efficacy to resist the development of abusive couple dynamics. The paper begins with an overview of the existing literature regarding how best to ensure that psycho-educational programs for youth (a) bring about desired attitudinal shifts and behavioural changes and (b) are experienced to be empowering by the program participants. After the content of the evaluated program is briefly overviewed, quantitative and qualitative findings of the evaluation are presented. The evaluation comprised of a waitlist controlled pre- to post-test study involving 147 girls aged 13 to 17 years. Risk-sensitivity, self-agency beliefs, victim-blaming attributions, and hypothetical responses to warning-sign scenarios were measured prior to and three to four months subsequent to the intervention group’s participation in the program. The evaluation data show that by involving girls in structured but autonomy-promoting group-based training activities, positive attitudinal and behavioural shifts can be achieved. For example, three to four months following the training participants’ responses to hypothetical warning-sign partner behaviours were less accommodating and/or less aggressive than before the training. Moreover, although participants reported greater perceived self-agency in the context of their couple-relationships after the training, initial victim-blaming attributions tended to wane. Overall, the results of this evaluation suggest that relationship-specific assertiveness training for adolescent girls in westernised nations is a worthwhile component in multilevel strategies designed to reduce the prevalence and impacts of chronic partner abuse. The implications of these findings for working with young men as well as young women are discussed.

Keywords: abusive couple, assertiveness training, adolescents
positive and negative
consequences of stress at work

Chair(s): DE BRUIN, G. (University of Johannesburg)
Discussant(s): DOLLARD, M. (University of South Australia)

This symposium examines the proposition that stress at work can—under certain conditions and for some employees—have positive consequences, such as engagement, satisfaction and growth. Whereas the link between job stress and negative outcomes is well established, less is known about the conditions under which positive outcomes occur. The theoretically and appealing idea that the availability of adequate job resources can turn the negative effects of high job demands into positive effects has proved difficult to demonstrate empirically. In addition, more knowledge is needed about the moderating role that person variables play in the stress-outcome process. The papers in this symposium investigate the conditions under which, and for whom stress may lead to positive or negative outcomes. The papers examine (a) the role of management level as a moderator of the effect of demands on job outcomes, (b) whether the moderating effect of job resources are more likely to be observed when resources are explicitly matched with job demands and outcomes, and (c) the longitudinal effect of stress in the relations of demands with positive and negative job outcomes. It is hoped that the symposium will contribute to a better understanding of how working conditions may be structured to promote positive consequences and for whom these consequences are most likely to be observed.

Are top executives different? Management level as moderator of the relation between job scope and positive and negative work outcomes

HAHN, V. (Johannes Gutenberg University), DORMANN, D. (Johannes Gutenberg University), STOCK-HOMBURG, R. (Technical University Darmstadt)

Top executives strongly influence the performance of organizations. However, empirical research that particularly focused on the group of top executives is scarce. We propose that top executives warrant special attention because common findings from other samples which are more frequently studied (e.g. lower level managers) may not apply to this group. Specifically, we examined whether top managers differ from middle managers with regard to consequences of common job-related variables. We used the job characteristics model as a framework to examine whether relations between job-related variables and motivational and strain outcomes are dependent on the management level. Particularly, we hypothesized that relations between task and skill variety, person-job fit and job control and positive and negative work outcomes (job satisfaction, job enjoyment, exhaustion, cynicism) are stronger for middle level managers than for top managers. 202 managers responded to a questionnaire containing measure of task and skill variety, person-job fit, and job control on the one hand and positive motivational outcomes (job satisfaction, job enjoyment) and negative strain outcomes (exhaustion, cynicism) on the other hand. In addition, managers' partners provided ratings of the outcomes measures. Results of hierarchical regression analyses showed that the relations between job-related variables and positive motivational outcomes (job satisfaction, job enjoyment) and negative strain outcomes (cynicism) were moderated by the management level. The positive relations of job-related variables with job satisfaction and job enjoyment and the negative relation of job-related variables with cynicism were stronger for middle managers than for top executives. This pattern of results also showed for the partner ratings of positive and negative outcomes. No interaction effects were found for exhaustion. Our findings show that top executives differ from executives of lower management levels. Motivators (e.g., job scope) that are effective at the middle management level are not equally effective at the top executive level. Similarly, demands or lack of resources do not as strongly impact on strain among top managers as they do among middle managers. These findings underline our
proposition that top executives present a special group that should be studied separately from lower level managers. Future research should aim at identifying critical job-related variables that are specific for top executives.

Keywords: performance, management, job characteristics, job satisfaction, job enjoyment

Customer-related social stressors and their consequences for service providers’ negative and positive affective reactions

DUDENHOEFFER, S. (Johannes Gutenberg University), DORMANN, D. (Johannes Gutenberg University)

Previous research has shown that customer related stressors (CSS) have detrimental effects for service providers’ well-being. We used threat to perceived justice as the central mechanism to explain the stressfulness of CSS. The aim of the study was to extend the knowledge about consequences of CSS (1) by analyzing short term changes in service providers’ negative and positive affective reactions as immediate consequences of CSS, (2) by comparing intra-individual as well as inter-individual effects, and (3) by investigating causality and reversed effects of CSS. We employed a diary design with three measurement occasions per day (before work, after work, before bedtime) over five consecutive working days and a short-term longitudinal design with two general surveys (interval: 14 days). For both designs we used the same sample of 151 employees from public service organizations. Diary data showed that CSS cause service providers’ negative affective reactions even after controlling for other sources of social stress (supervisors, co-workers, persons of the private life). However, we did not find effects on positive affective reactions. Longitudinal data showed that CSS increase negative affect but has no effect on positive affect. We also found empirical evidence of reversed effects of service providers’ affect on CSS. Pattern of results were similar for inter-individual and intra-individual effects. Customers represent an important source of social stress for service providers. Reversed effects of service providers’ affect to CSS indicate vicious cycles between customers’ and service providers’ behaviours. Similarities of inter-individual and intra-individual effects show that a single theoretical mechanism might be sufficient, which is assumed to be threat to perceived justice. To prevent negative consequences of customer-related stressors we considered counterbalances to customer-related stressors to restore justice and inhibit negative affective reactions. We suggested supportive behaviours by supervisors and co-workers as possible counterbalances.

Keywords: customer related stressors, well-being, public service organizations, social stress, longitudinal data

High job demands can have positive consequences: The moderating role of matching job resources

NEL, J. (University of Johannesburg)

A large body of research has demonstrated an additive effect of job demands and job resources on strain related job outcomes, such that high levels of demands and low levels of resources lead to strain. By comparison, relatively few studies have (a) demonstrated an interactive effect between demands and resources, and (b) focused on growth related rather than strain related outcomes. One reason for the failure to observe the interactive effect is that researchers have failed to match the type of job demand with the type of resource. Such an interactive effect has important implications in the sense that appropriate resources may potentially turn the negative consequences of high demands into positive consequences, such as increased work engagement. In accord with the Demands-Induced Strain Compensation (DISC) Model this study examines whether workers can flourish under high demands when resources and outcomes match the type of demands. 348 adult workers representing a wide variety of occupations completed measures of cognitive and emotional demands and resources on the one hand and measures of growth related outcomes (work engagement, self-efficacy expectations and happiness) on the other hand. Hierarchical regression analysis revealed that emotional resources significantly moderates the relation between emotional demands and work engagement, high demands.
coupled with low resources led to reduced engagement, but high demands coupled with high resources led to improved engagement. Similar, but weaker moderating effects were observed for happiness (emotional demands and resources) and self-efficacy (cognitive demands and resources). The findings show that optimal combinations of matched job demands and job resources can produce growth in positive work outcomes, such as engagement, self-efficacy and happiness. In accord with predictions of the DISC Model, appropriate job resources have the potential to change job demands from producers of strain into producers of motivation, confidence and engagement. The findings provide support for the proposition that the moderating effect of job resources is most likely to be observed when the resources match the demands and the outcomes of interest.

Keywords: job demands, job resources, work engagement, self-efficacy, happiness

High job demands need not lead to poor health: The moderating effect of matching job resources

DA SILVA, A. (University of Johannesburg)

Research has established that excessive job demands are associated with poor health and other negative job outcomes, such as burnout and social dysfunction. This study tested the hypothesis of the Demands Induced Strain Compensation Model that workers with access to appropriate job resources can remain healthy and motivated in the face of high job demands when they have access to appropriate job resources. Previous studies have often failed to find the theoretically and practically appealing moderating effect of job resources. This study builds on previous research by explicitly matching types of demands with types of resources in the expectation that this will increase the likelihood of observing the interactive effect of job demands and resources. 348 adult workers representing a wide variety of occupations completed measures of cognitive and emotional demands and resources on the one hand and measures of strain related outcomes (burnout, depression, social dysfunction, worry, and desire to discontinue work) on the other hand. Hierarchical regression analysis revealed that (a) cognitive resources significantly moderates the relation between cognitive demands and the desire to discontinue work, and (b) emotional resources significantly moderates the relation between emotional demands and social dysfunction. Results indicate that access to appropriate resources enable workers to remain motivated and socially healthy in the face of high job demands. The findings show that optimal combinations of matched job demands and job resources can counteract the negative effects of job stress. In accord with predictions of the DISC Model, appropriate job resources have the potential to moderate the negative effects of job demands on workers motivation and social functioning. The findings provide support for the proposition that high job demands do not necessarily lead to negative outcomes. Indeed when resources match demands, positive outcomes may be observed in the face of high demands.

Keywords: job demands, burnout, social dysfunction, Demands Induced Strain Compensation Model, job resources
Positive psychology at work: Strengths-based approaches to performance enhancement

Chair(s): GORDON, S. (The University of Western Australia)

Discussant(s): VELLA-BRODRICK, D.

The purpose of this symposium is to illustrate applications of strengths-based approaches in four different performance environments. Prior to an open question and answer session, to conclude the symposium, a discussant will summarize core themes from the four presentations. The strengths philosophy championed by Donald O. Clifton, and other Gallup researchers, is the assertion that individuals are able to gain far more when they expend effort to build on their greatest talents than when they spend a comparable amount of time and effort to remediate their weaknesses (Clifton & Harter, 2003). In addition to Clifton’s pioneering studies on strengths, strengths approaches can be traced back over 60 years to the management literature of Haldane (1947) and Drucker (1967). However, with the advent of positive psychology only recently have thought leaders in business, education and sport shifted from deficit- and problem-focused models to abundance- and solution-focused approaches towards individual performance enhancement and organizational development. Linley (2008) defines a strength as ‘a pre-existing capacity for a particular way of behaving, thinking, or feeling that is authentic and energizing to the user, and enables optimal functioning, development and performance’ (p. 9), while Rath (2007) believes strengths are composed of skills, knowledge and talents. The typical process of strengths development begins with identification, moves into integration, and ultimately to changed behaviors and outcomes (Clifton & Harter, 2003). Subsequently, in this symposium each presenter will describe how they developed strengths, specifically in sport, dance, military, medical and educational settings, by first identifying strengths, then integrating a focus on strengths into the respective working cultures, and, finally, how they monitored changes in behaviors and outcomes. In summary, the key learning objectives of this symposium include: a brief history on strengths and strengths-finding approaches; how strengths-based approaches map onto applied positive (coaching) psychology; how to both identify and integrate strengths in the workplace; how to determine outcome measures of behavioral change as a consequence of strengths-based management.

Strengths-based coaching of mental toughness in sport: Case study of a professional cricket team

GORDON, S. (The University of Western Australia)

Illustrated in this presentation is a strengths-based approach to developing mental toughness among individual professional cricketers and an entire cricket team. The Cricket Mental Toughness Inventory (CMTI; Gucciardi & Gordon, 2009) and the Center for Applied Positive Psychology (CAPP) Realise2 Model (Linley, 2008) were employed to examine changes in mental toughness over an entire season of play (October 2009 – March 2010). Individual dispositional leadership was also determined using Hogan Assessment Systems (Hogan & Hogan, 2007). The initial 24-item version of the CMTI is comprised of six factors - Affective intelligence; Desire to achieve; Resilience; Attentional control; Self-belief; and Cricket Smarts. It was administered pre- and post-season to all members (n=28) of an Australian State cricket squad. The CAPP Realise2 Model proposes four means of “making weaknesses irrelevant”: Role shaping – defining roles around a person’s strengths, rather than trying to define the person around roles; Complementary partnering – working with someone who compensates for an individual’s weaknesses; Strengths-based team work – similar to complementary partnering but chunks up a level and applies the approach to the ‘team’ rather than to individuals; and Training – used when roles cannot be crafted differently or there is no one with whom one can partner or there is no wider team to share the burden. Pre-season CMTI and Hogan data did not discriminate either mental toughness or leadership capacity among players so both leaders and their respective leadership groups
were determined by cricket-specific criteria. A hybrid strengths-finding exercise facilitated role shaping, and positively impacted senior players in particular. Making weaknesses irrelevant using complementary partnering, strengths-based team work and training were also well received and preliminary interview data indicate that changes in mental toughness are occurring. Post-season CMTI data, including multi-source and interview responses, will be collected February-March 2010. Professional athletes indicated overwhelming support for the present strengths-based approach to building mental toughness. Preliminary qualitative and quantitative findings indicate that the most positive changes appear more evident among senior players. Use of multi-source CMTI data and Hogan reports and how these were integrated within the strengths approach will be discussed.

Keywords: strengths-based coaching, mental toughness, sport, case study, professional cricket team

The art of the positive pas de deux: Putting positive psychology into dance!

MOYLE, G. (Queensland University of Technology)

Performance psychology has more recently included a focus on applied practice within the performing arts, and specifically the dance industry. Whilst the use of psychology within this field has been occurring for a number of years, it has primarily taken its cues from the area of sport psychology or clinical psychology when dealing with ‘problems’ (e.g. eating disorders). What has been evident with the more recent introduction of positive psychology concepts with this population is the observed responsiveness from dancers towards a strengths-based approach. The aim of the inclusion of these frameworks has been to assist in increasing the empowerment, personal responsibility and effectiveness of the dancers’ psychological preparation and skills in the area of performance – whether on stage or off. A positive psychology and strengths-based approach has been incorporated with both dancers-in-training and lecturers as part of a University dance degree program. Performance Psychology is taught into a range of subjects across Orientation Week, Integrated Professional Skills (pre-Semester preparation), Mid-Semester, and Professional Skills. Within the past 5 out of 8 years involvement in the teaching of Performance Psychology to First, Second and Third year dance students within a University dance program, the shift towards the application of positive psychology principles has warranted an observed trend in the uptake of psychological learning and educational strategies regarding effective application of techniques resulting in attitudinal shifts regarding approaches to both performance in their dance studies and career, as well as life in general. This has been observed through self-report assessment pieces outlining personal learning and effective application, in addition to actual observed performance progress and success. The inclusion and integration of positive psychology and strengths-based framework into the delivery of content of subjects within a University dance program have been observed to have helpful outcomes at both the performance, academic and personal levels for students. The shift of focus towards the positive psychology approach is therefore believed to be of high importance in its ability to positively impact upon the application of performance psychology strategies and general psychological principles within the unique area that is dance.

Keywords: positive psychology, dance, eating disorders, performance, strengths-based approach

Strengths profiling using the revised performance profile technique: A case study approach

GUCCIARDI, D. (University of Queensland), TEMBY, P. (Defence Science and technology Organisation)

Unlike traditional psychometric assessments that impose desirable constructs on an individual (e.g., questionnaires), the performance profiling technique (Butler, 1991; Gucciardi & Gordon, 2009) engages an individual in a more active role in the decision-making process. Stemming from a personal construct psychology (Kelly, 1955/1991) framework, which emphasises the importance of understanding the ways in which individuals perceive the world, the performance profile
encourages researchers and practitioners to regard an individual’s perception or meaning of his or her performance as an essential source of information for identifying and understanding strengths as well as areas requiring development. Previously the application of this technique has been limited to sport settings. However, the purpose of this presentation is to explore the technique’s applicability in two unique performance settings, namely the military and surgery. A case-study approach was employed to explore a military officer’s and medical surgeon’s perceptions of the characteristics and skills required for excellence in their performance setting. Each interview was guided by the processes outlined in the revised performance profile technique (Gucciardi & Gordon, 2009), and audio recorded and transcribed verbatim. In addition to the elicitation of bipolar constructs in rank order of importance and self-assessments (e.g., self-belief vs. self-doubt), information on situations or events when the constructs are considered useful (e.g., testing out a new surgical procedure) and an understanding of the application of each construct in such situations was generated (e.g., knowing that you’ve done the training and practice [self-belief]). Quantitative and qualitative data pertaining to each of these issues is described to better understand each participant’s individual strengths and their performance domain. Both qualitative and quantitative data relating to an individual’s strengths can be generated using the revised performance profile technique. Quantitative data provides a benchmark for temporal or intervention assessments whereas qualitative information provides an understanding of the application of certain strengths as well as methods for enhancing their maintenance. It is our hope that the current research will stimulate applications of the technique in other performance settings beyond the sporting context.

Keywords: performance profile technique, decision making process, sport, case study, military

Strengths in education: Leveraging strengths to create flourishing students, teachers and schools

GREEN, S. (Positive Psychology Institute)

The development of the Values in Action Inventory of Strengths (VIA-IS), a character strengths assessment (Peterson & Seligman, 2004), has supported and driven the positive psychology movement. Over one million people have now taken the assessment on-line (VIA Intensives, Sydney, 2009). Recently, a focus on strengths has occurred within the educational sector in Australia. Within an educational setting, strengths identification and use can be explored in the classroom for the optimal functioning of both students and teachers; within the curriculum where there is a growing discussion on how to embed strengths based approaches; and at a whole-school level where a focus on strengths can assist in the development of a “flourishing school”. This presentation will provide an overview of both the research and practice on strengths-based approaches in education occurring in Australia and globally. Specific case studies will be utilised to illustrate how a scientist-practitioner approach to strengths-based development in education can be taken. In a growing number of schools, both teachers and students are assessing strengths. The VIA-IS is utilised to identify an individual’s top 5 “signature strengths”. The assessment can be taken free on-line (www.viacharacter.org). The accompanying handbook, “Character Strengths and Virtues: A Handbook and Classification can be utilized to learn more about each character strength. Data from a pilot study using VIA-IS with year 5 students in a Sydney school and from two programs delivered to Sydney school teachers will be presented. Results support previous research findings that the identification and use of “signature strengths” in novel ways can positively affect well-being. Playing to an individual’s character strengths enhances well-being because they are able to do what they naturally do best, and thus generate feelings of autonomy, confidence, and self-esteem (Linley & Harrington, 2006). In using the Values in Action survey, both teachers and students are provided with a useful vocabulary to both identify and talk about their own character strengths. Whilst research support is still accumulating, there have been enough outcome studies conducted to conclude that
strengths-based approaches are extremely promising.

Practitioner health and professional practice:
Interactions and interventions

Chair(s): ALDER, J. (Private Practice)

In early 2007 the Australian Psychological Society commenced a process of exploring the relationship between the health issues of psychologists and their professional practice. The reports of the California Psychological Society’s Collegial Assistance Program have been informative in indicating the nature and extent of the need and related services in the United States. Published research on the health and stress of Australian psychologists is scarcer. Examples of unpublished Australian research have been identified and are presented in this symposium. The design and provision of support services for psychologists with health issues, that can affect their professional practice, is developing on various fronts. Self-help care guides, peer support groups and complaints management are some approaches identified by presenters. Presenters will outline the rationales, practices and reviews being undertaken by a state registration board, the new Psychologists Board of Australia and the major professional society to encourage healthy behaviours, health monitoring and health recovery of psychologists with health issues. The key learning objectives are: 1) to illustrate approaches and outcomes of Australian research on the health issues of psychologists and its relation to their professional practice; 2) to identify principles and processes developed by psychologist registration/regulatory bodies to manage to identification, monitoring and rehabilitation of impaired psychologists; 3) to indicate alternate approaches to assisting health professionals manage and recovery their health.

Associations among therapist beliefs, personal resources and burnout in clinical psychologists

WADE, T. (Flinders University)
This research investigates the relationship of therapy-related beliefs and self-care to work stress. A survey was conducted of 190 South Australian Clinical Psychologists in terms of demographics, workplace variables, burnout, beliefs about conducting therapy, and personal resources. A modified version of the Therapist Belief Scale was used and a factor analysis reveals four factors with themes of therapy-related beliefs about distress, therapeutic models, responsibility, and control and understanding. Unhelpful beliefs are found to be as important as work factors and demographics in predicting work stress. Only partial support is found for self-care to moderate the relationship between unhelpful beliefs and work stress. Multivariate analyses were conducted and identified a number of factors linked to practitioner stress and burnout. These will be discussed and strategies for working with therapist beliefs and personal resources in supervision will be explored.

Keywords: beliefs, clinical psychologists, personal resources, burnout, distress

The experience of depression amongst Australian psychologists

MOORE, B. (Private Practice), LAWRENCE, D. (Private Practice)

This paper reports on the findings of a qualitative study into the personal experiences of depression amongst a sample of Australian psychologists. The study explores four domains of data (i) The inner experience of the illness for practicing psychologists i.e. the personal experience of depression and intervention practices, (ii) the professional self and the impact of the illness on practice and treatment approaches, (iii) relational responses to the illness, decisions about disclosure and experiences of stigma, and, (iv) the frameworks used by participants to give meaning to their experience of depressive illness. Themes of silence, pain, harm, identity, meaning and engagement are found to be woven throughout these narratives.

Keywords: depression, psychologists, interventions, treatment approaches, stigma

Managing an impaired psychologist - a supportive approach to protecting the public

FRANKCOM, K. (Psychologists Registration Board of Victoria)

The Psychologists Registration Board of Victoria (PRBV) in implementing the legislative requirements to investigating a notification about an impaired psychologist has attempted to support the psychologist experiencing health impairment whilst ensuring the public is protected. The theoretical principles that are drawn upon in Board deliberations include “therapeutic jurisprudence”. The PRBV has actively promoted ill health prevention with its resource kit which is available on line: “Health Matters for Psychologists”. In recent developments, the Health Practitioner Regulation National Law Act 2009 which will be the basis for the regulation of all health practitioners from July 1 2010 has enshrined the mandatory notification by health practitioners of other health practitioners where there are issues of the practitioner being impaired. Implications under this new regulatory requirement will be discussed.

Keywords: Psychologists Registration Board of Victoria, psychologists, health impairment, therapeutic jurisprudence

Well-Being: Prevention and self care for the empowered psychologist

BEVERNEST, B. (Australian Psychological Society)

In 1994 The California Psychological Association (CPA) formed the Colleague Assistance and Support Program (CLASP) Task Force to investigate California Psychologist’s vulnerabilities to wellbeing, barriers to seeking out support, and their perceptions between how they perceive themselves compared to their colleagues’ level of health and/or impairment. Since that time CPA has turned the Task Force into an on-going Committee which I have chaired since 2005 and currently Co-Chair with Diane Bridgeman, Ph.D., Chair of the American Psychological Association Advisory Committee to Colleagues Assistance (APA ACCA). The Mission of CPA CLASP is to: Provide preventive resources that will support
us as psychologists in maintaining and enhancing our general health and mental well-being throughout the developmental spectrum of our personal and professional lives; destigmatize help seeking and health seeking behaviors and interventions; endeavor to reduce the occurrence, frequency, and severity of distress and/or impairment of California psychologists through prevention, education, early identification, and referral; and to encourage collegial understanding, support, and referral for California psychologists who are experiencing distress and/or impairment.

We are currently analyzing the data of a nation survey we conducted in collaboration with the APA ACCA. Our Survey investigated: (1) the needs, preventive/practices/interventions, and obstacles psychologists engage in to address issues of stress – distress; (2) Protective factors and risk factors; and 3) Barriers to seeking help. I will report on these findings as well as discuss the current mission, programs, obstacles, and vision of CPA CLASP.

### Predicting and promoting emotional health in patient groups with chronic health conditions

Chair(s): RICCIARDELLI, L. (Deakin University)

The physical and emotional demands of a chronic illness present many challenges for the individual. Among these include the risk of developing and managing high levels of depression and anxiety. As these symptoms significantly reduce individuals’ quality of life, it is important that special attention is paid to better understand and manage emotional health. The present symposium is designed to further our understanding of the nature and the impact of the emotional health experienced by individuals with chronic health conditions in four different contexts. In addition, the symposium examines ways of managing and ameliorating emotional health, with an emphasis on interventions that focus on self-care and self-help. The first paper examines the disease-related psychosocial concerns of youths with Type 1 diabetes living in rural areas, and the relationships between diabetes self care, metabolic control, emotional health, quality of life and the availability of social support. Two of the main predictors of poor self-care were high negative affect and low levels of social support. The second paper examines the psychological characteristics of women diagnosed with breast cancer that are associated with adherence and affective responses, which reduce the risk of developing Lymphoedema. These include self-efficacy and self-regulatory ability to manage stress associated with Lymphoedema risk. The third paper examines the efficacy of the Expressive Writing paradigm as a self-help intervention to reduce post-traumatic stress symptoms among cancer patients and community volunteers. This involved investigating whether writing about one’s stressful experiences is more or less beneficial for individuals who are experiencing stress reactions compared to non-stressed individuals.
Support was found for the effectiveness of this intervention. The fourth paper examines the efficacy of a Motivational Interview Health Coaching intervention and the effects of increasing physical exercise for individuals with a chronic illness. There was no evidence that this intervention was effective. However, individuals who chose to increase exercise showed a reduction in their anxiety levels. The implications of the findings for clinical practice will be outlined by the discussant.

Predictors of self care among youth with Type 1 diabetes from rural and urban Victoria

HACKWORTH, N. (Parenting Research Centre, Melbourne)

Adolescents with Type 1 diabetes (T1D) have considerable physical and emotional demands placed on them by their illness, especially in the context of negotiating adolescent development and the pathway to independent self care. Research suggests this places them at significant risk of developing mental health problems particularly when they are isolated from services. The aims of this study were to document the disease-related psychosocial concerns of youths with T1D from rural areas and to assess the impact of rural location on the relationships between diabetes self care, metabolic control, negative emotions, quality of life and the availability of social support. 123 youths with T1D (73 rural dwellers, 50 urban dwellers), between the ages of 13 and 25, completed a questionnaire assessing diabetes self care, self efficacy, negative affect, quality of life, and perceived social support and risk taking behaviour. Twenty-two of the rural adolescents participated in online focus groups and one parent of each completed a telephone interview. No significant rural/urban differences were observed on any of the variables. Both urban and rural youths with T1D were at heightened risk of adverse mental health outcomes, particularly anxiety, and this risk increased with age. Predictors of poor self care were increased negative affect and risk taking; and lower levels of community engagement, social support and self efficacy. Self care, with urban dwelling predicted improved metabolic control. Rural adolescents and their parents reported a sense of geographical and social isolation, worry about life-threatening health complications, fatigue and concern about parent/adolescent interactions. The findings support the need for an affordable and accessible adolescent/parenting mental health program to prevent depression and anxiety and promote positive self care behaviours in young people with T1D.

Keywords: adolescents, type 1 diabetes, mental health problems, quality of life, social support

Psychological profiles of women diagnosed with breast cancer regarding adherence to Lymphoedema risk minimization behaviours

KANGAS, M. (Macquarie University), KOELMEYER, L. (Westmead Breast Cancer Institute)

Lymphoedema, a chronic condition causing physical and psychological impairment, may develop following treatment for breast cancer. Guidelines for Lymphoedema risk management recommend lifetime adoption of simple behavioural measures, such as minimizing trauma to the affected arm. The aim of this study was to identify psychological characteristics of women at the time of breast cancer diagnosis (N=106) that are associated with adherence and affective responses to Lymphoedema risk at three months post-diagnosis. Assessments of psychological factors including perceived consequences of Lymphoedema, self efficacy to manage Lymphoedema risk, self-regulatory ability to manage stress associated with Lymphoedema risk and perceived Lymphoedema risk were conducted at the time of breast cancer diagnosis. Outcome measures including Lymphoedema knowledge, adherence to risk minimization recommendations and Lymphoedema-related distress were assessed three months later following surgery. K-means cluster analysis was initially conducted to characterize the sample into three distinct cluster cognitive profiles according to the psychological factors assessed at the time of diagnosis. Using the GLM procedure, levels of adherence to recommended Lymphoedema risk reduction behaviours, and Lymphoedema specific distress, were found to differ between...
clusters. No differences between clusters were evident for perceived Lymphoedema risk and knowledge. Cluster 1, characterized by women believing that there are few negative consequences of Lymphoedema, having low self-efficacy and low self-regulatory ability were found to have lower adherence and less distress than individuals in Clusters 2 and 3 exhibiting higher levels of self-efficacy, greater perceived negative consequences and higher self-regulatory ability. These findings demonstrate that specific patterns of psychological factors underlie adherence to risk management recommendations. Since lifetime enactment of these risk minimizing behaviours is recommended, these findings highlight the need for interventions to address self-efficacy and specific beliefs held by women with breast cancer that may be a barrier to ongoing adherence.

Keywords: Lymphoedema, breast cancer, distress, self-efficacy, risk minimization

Can journal writing enhance well-being in stressed populations? An investigation of the expressive writing paradigm as a potential self-help intervention for stressed cancer patients

KANGA, M. (Macquarie University), MILROSS, C. (Royal Prince Alfred Hospital)

The Expressive Writing (EW) paradigm has been found to be helpful in improving well-being in various populations, (most commonly in university samples). However, inconsistent findings have been documented for samples with elevated posttraumatic stress symptoms (PTSS) including individuals diagnosed with a potentially life-threatening medical condition (such as cancer). Hence, the verdict is still out as to whether the EW paradigm is beneficial for individuals suffering from elevated trauma symptoms. Accordingly, the aim of this study was to investigate whether writing about one’s stressful experiences is more (or less) beneficial for individuals who were experiencing heightened stress reactions compared to non-stressed individuals within 2 distinct adult samples; recently treated cancer patients and community volunteers. Participants were administered questionnaires that assessed posttraumatic stress, appraisals, and somatic symptoms. Individuals were randomly allocated to one of two writing interventions focusing on; (i) stressful events (EW group) or (ii) non-stressful events (C group), over 4-consecutive weekly, 20 minute sessions. Participants were re-assessed at 1- and 6-months follow-up (FU). Complete data has been obtained for 68 community and 39 cancer participants (this study-arm is in progress). At baseline, one-third of the community (35%; n=24) and cancer (31%; n=12) participants had moderate-to-severe PTSS (assessed by the PDS). At 6-months follow-up, stressed individuals in the EW intervention were found to have a significant decline in PTSS in both the cancer and community sub-samples relative to non-stressed individuals in the EW condition as well as stressed and non-stressed individuals in the control writing conditions (p < .05). Stressed individuals in the EW conditions also reported a decrease in somatic symptoms at 6 months FU. In addition, stressed community participants in the EW condition were found to have a significant decrease in negative self appraisals relative to non-stressed community participants (p < .05). The results will be discussed in context of the potential utility of the EW paradigm in improving well-being in stressed health and community populations.

Can a behavioural intervention reduce depression or anxiety in those with a chronic illness?

DI BENEDETTO, M. (University of Ballarat)

The aim of the current study was to determine if a Motivational Interview Health Coaching intervention could improve mental health status, increase healthy behaviours and coping. Behaviour change, depression, anxiety, coping, resilience, and health factors were compared in participants allocated to either the treatment group who received the intervention, or the active control group. The intervention consisted of up to three face-to-face individual motivational interview health coaching sessions. These sessions incorporated health promotion and evidence-based
behaviour change techniques, such as motivational interviewing, decisional balancing, solution-focused counseling, and goal setting, within a coaching context. Contrary to expectation those in the control group experienced a reduction in anxiety and an increase in coping resources. Current findings did not provide evidence for the effective reduction in depression, anxiety or significant health outcomes as a result of the behavioural intervention. Participants who chose to increase physical exercise experienced a reduction in anxiety compared to those that did not increase physical exercise. These results suggest that the significant reduction in anxiety experienced by the control group may have been due to the benefits of increased physical exercise. The study indicates that health information and self-monitoring, for those willing to make a health behaviour change, may be a sufficient strategy and needs further investigation. The study provides further support for the anxiolytic effect of physical exercise.

Keywords: motivational interview health coaching intervention, mental health, coping, resilience, depression

Prediction of well-being for college students in the USA: Cross-cultural validity of different theoretical perspectives

Chair(s): SHEU, H. B (Arizona State University)

Discussant(s): SHEU, H. B. (Arizona State University)

The purpose of the symposium is to introduce the current status of the well-being literature and the findings of a research program conducted in the United States. The symposium consists of four individual presentations – a brief review of the psychological literature on well-being followed by three empirical studies. The first presentation will provide an overview of how well-being has been conceptualized and the two theoretical perspectives developed to predict well-being outcomes. A rationale for the subsequent three empirical studies will also be highlighted. The first and the second empirical studies are designed to test the effectiveness of two theoretical models, Ryan and Deci’s (2001) Self-Determination Theory and Lent’s (2004) social cognitive perspective, in predicting the well-being of American college students under normal life conditions. Additionally, we will test the applicability of the two models to students with different racial backgrounds. The third empirical study focuses on a different population – international students in the U.S. Specifically, this study explores how social cognitive constructs can be utilized to forecast international students’ acculturative stress and well-being. Together, the four presentations will provide the audience with knowledge about the progress that has been made in the well-being literature in the U.S. and the utility of different models in explaining the well-being of students from different racial/cultural groups. Implications for cross-cultural counseling practice and directions for future research will be discussed. The learning objectives of this symposium are: (1) Participants of the symposium will acquire knowledge about the
current status of the well-being literature in the U.S. (2) Participants will gain understanding of the key concepts of Self-Determination Theory and how the concepts could be used to improve the well-being of American college students. (3) Participants will become familiar with empirical findings derived from the social cognitive perspective and how to apply these findings to increase students’ well-being. (4) Participants will gain knowledge about acculturative stress that international students may experience and the relevance of social cognitive constructs to help them overcome acculturative stress and restore their well-being. (5) Participants will familiarize themselves with knowledge about the effectiveness and cross-cultural validity of different theories proposed to explain and predict well-being.

The current status of the well-being literature in the United States

SHEU, H. B (Arizona State University)

The purpose of this presentation is two-fold: (a) provide a brief overview of the psychological literature on well-being in the U.S., and (b) offer the rationale for the three empirical studies included in this symposium. In recent years there has been a shift in psychology toward reviving the study of happiness and optimal human functioning (Seligman & Csikszentmihalyi, 2000). The increasing number of studies conducted in the area reflects this trend. Well-being has been conceptualized from different philosophical perspectives. For example, the eudaimonic approach defines well-being as personal growth, purpose, and meaning in life, whereas the hedonic approach views well-being as synonymous with feeling good or happiness (Ryan & Deci, 2001). Different models have been proposed to operationalize these two perspectives. As an example of the eudaimonic approach, Ryff’s (1989) model of psychological well-being (PWB) emphasizes different aspects of positive functioning, such as self-acceptance, autonomy, and personal growth. On the other hand, typifying the hedonic approach, Diener’s (1984) tripartite model of subjective well-being (SWB) focuses on life satisfaction, the presence of positive affect, and the absence of negative affect. Research has shown that indicators of PWB and SWB might represent distinct but related latent dimensions (McGregor & Little, 1998). In addition to defining well-being, different theories have also been proposed to explain and predict this important construct. Deci and Ryan (2001) applied the concepts derived from Self-Determination Theory to predict a variety of well-being indicators, and argued that satisfaction of three basic psychological needs is essential in achieving well-being. Based on Bandura’s social cognitive theory, Lent (2004) put together two unifying models to explain how individuals achieve and restore life satisfaction under normal and challenging life conditions (normative vs. restorative models). In Lent’s models, social cognitive variables (i.e., self-efficacy, outcome expectations, goal progress) play the key mediational roles. The review of the well-being literature in the U.S. indicates the need to test the effectiveness of different theoretical models in predicting various well-being outcomes. Also, the applicability of these models to different racial/cultural groups in the U.S. remains uncertain. The following three presentations represent an empirical effort to answer these questions.

Keywords: well-being, life satisfaction, social cognitive theory

Using Self-Determination Theory (SDT) to predict well-being of college students with different racial backgrounds

SHEU, H. B (Arizona State University)

The current study was designed to test the cross-cultural applicability of Self-Determination Theory (SDT; Ryan & Deci, 2000). Specifically, SDT posits three basic psychological needs – autonomy, competence, and relatedness – and hypothesizes that fulfillment of these needs would promote psychological growth and well-being. Ryan and Deci and their colleagues have conducted a number of studies and have found support for their claims (e.g., Deci et. al., 2001; Ryan et. al., 2008). However, the effectiveness of three basic psychological needs in predicting well-being has not been tested in a comprehensive model that integrates other predictors, nor has SDT been used to explain well-being of
individuals with racial/ethnic backgrounds. Findings of the study will help to fill in these gaps with a diverse U.S. college student sample. A sample of 752 college students (47% males, 53% females), whose mean age was 20.6 years with a SD of 3.84 years, from a large Southwest university in the U.S. responded to a survey developed to measure predictors (e.g., personality, academic support), mediators (i.e., satisfaction of three basic psychological needs), and indicators (e.g., academic satisfaction, global satisfaction, self-esteem) of well-being. The sample self-identified as Caucasian (55%), Latino-American (15%), Asian-American (9%), African-American (7%) and individuals with other backgrounds (14%). Preliminary findings indicate that personality and academic support were associated with satisfaction of three basic psychological needs ($r_s$ ranged from .24 to .41, $p_s < .01$), while the three basic psychological needs were also highly correlated with each other ($r_s$ ranged from .45 to .57, $p_s < .01$). Moreover, three basic psychological needs were related to academic satisfaction ($r_s$ ranged from .35 to .57, $p_s < .01$) and life satisfaction ($r_s$ ranged from .30 to .39, $p_s < .01$). Preliminary findings of the study suggest the possibility that satisfaction of three basic psychological needs may mediate the relation of personality and academic support to well-being outcomes. The data were collected from 752 college students at a large Southwest university in the U.S. (the same sample of participants also responded to a different set of instruments included in Presentation 2). Participants completed a battery of measures that were designed to assess personality and academic supports, social cognitive variables (i.e., self-efficacy, outcome expectations, goal progress), and well-being outcomes (i.e., academic satisfaction, global satisfaction, psychological well-being). Specifically, social cognitive variables are hypothesized to be the mediators in the relations of personality and academic supports to well-being outcomes. Findings from preliminary analyses showed that social cognitive variables were correlated with well-being outcomes ($r_s$ ranged from .20 to .51, $p_s < .01$) and personality and academic supports ($r_s$ ranged from .14 to .36, $p_s < .01$). Also, personality and academic supports were associated with well-being outcomes ($r_s$ ranged from .22 to .46, $p_s < .01$). Results of the study offered initial support for testing social cognitive variables as mediators in the relations of personality and academic supports to well-being. The full model outlined by Lent (2004) will be tested using multi-group SEM across White American, Asian American, and Latino/a samples. Implications for cross-cultural counseling practice and research will be discussed in the presentation.

**Keywords:** Self Determination Theory, cross-cultural, college students, well-being, personality

**Predicting American college students’ well-being from a social cognitive perspective: Cross-cultural comparisons**

MEJIA, A. (Arizona State University)

Based on Bandura’s social cognitive theory, Lent (2004) proposed a unifying framework to explain how individuals achieve and maintain their well-being under normal life conditions. In Lent’s normative well-being model, social cognitive constructs (e.g., self-efficacy, outcome expectations, goal progress) are integrated with personality and environmental variables in predicting life satisfaction. Specifically, social cognitive variables are hypothesized to be the mediators in the relation of personality and environmental predictors to well-being outcomes. Given that White Americans have been the center of empirical attention in the well-being literature, the current study is designed to apply Lent’s normative model to college students with different racial backgrounds in the U.S. This design allows us to directly test the cross-cultural validity of this particular well-being model. Given the salience of academic performance in college students’ lives, most variables included in this study were contextualized in the academic domain. Complete results and cross-cultural validity of SDT will be presented and discussed at the symposium.
Predictors of international graduate students’ well-being: A restorative model analysis

RIGALI-OILER, M. (Arizona State University)

The well-being literatures in the U.S. have focused mostly on variables associated with achieving and maintaining satisfaction under normal life circumstances. To fill in this gap, Lent (2004) proposed a model of restorative well-being that put together social cognitive, environmental, and personality variables to explain how individuals reinstate their satisfaction under stressful conditions. Using the restorative well-being model, the presentation will introduce findings derived from a sample of international students in the U.S. It has been argued that international students, as they transition from one culture to another, often experience acculturative stress (e.g., Chavajay & Skowronek, 2008). The variables outlined in Lent’s (2004) model will be used to predict the relationship between acculturative stress and well-being, and explain how international students restore their satisfaction in the cultural transition process.

Based on Lent’s (2004) model, an on-line survey was designed to assess life satisfaction and acculturative stress as well as their predictors, such as coping strategies, coping efficacy, environmental support, and personality variables. Except personality and life satisfaction, all other variables are contextualized in the academic arena as it is the primary life domain for international students. At the time of this proposal (June 2009), 61 students from a large Southwestern University have completed the survey, and data collection will continue into Fall 2009 and Spring 2010 until the desirable sample size is reached. The majority of participants came from Indian (55%), followed by China (17%), Taiwan (8%), and other Asian countries. At the time of the proposal, preliminary findings indicate that acculturative stress was negatively related to life satisfaction ($r = -.27, p < .05$). Moreover, personality (i.e., emotional stability) was related to well-being ($|rs| = .13$ to $.37$). Preliminary findings suggest that coping efficacy and academic supports are likely to mediate the relations of personality to well-being outcomes (e.g., acculturative stress, satisfaction) for international students. The restorative model will be tested using SEM techniques. Directions for future research and clinical implications for cultural adjustment will be highlighted.

Keywords: well-being, restorative well-being, life satisfaction, international students, cultural transition
Prejudice and racism: What can psychology do?

Chair(s): AUGOUSTINOS, M. (University of Adelaide)
Discussant(s): SONN, C. (Victoria University)

It is now over ten years since the APS published the Position Paper on prejudice and racism (1998). This symposium reflects upon the impact of this paper on the discipline, the profession, and the wider society. Following the recommendations of the paper in the intervening years various intervention programs have been developed and introduced to combat prejudice and racism on several levels. The speakers in this symposium will discuss the development and introduction of recent new initiatives in the spirit of the position paper including: the Boatshed Declaration on Racism, the New Arrivals Program for refugee children in South Australian schools and the Treaty movement in New Zealand. The symposium will also consider the psychological impact and significance of the recent apology to the Stolen Generations. Key learning objectives include: the history and role of psychology in the colonising project in Australia and New Zealand, psychology's role in the oppression and marginalisation of Indigenous peoples, what psychology can do to encourage and promote reconciliation between Indigenous and non Indigenous people; and how psychological knowledge can be used to inform social policy and significant public debates.

Australian psychology and racism: The Boatshed Declaration

DUDGEON, P. (University of Western Australia)

In June 2009, over 40 leading researchers and academics from across Australia met at the University of Western Australia Boatshed in Perth, to discuss research concerning racism towards Aboriginal and Torres Strait Islander Australians. The Australian Psychological Society, the Australian Indigenous Psychologists Association, the Australian Human Rights Commission, the Telethon Institute of Child Health Research, the Australian Indigenous Doctors Association, University of Notre Dame and the University of Western Australia hosted the gathering. This paper will present the Boatshed Declaration and the major conclusions from the gathering and discuss the implications of these in the profession of Australian psychology. The two-day meeting culminated in the production of a detailed statement against racism. It was also deemed timely to consider anti-racism strategies and make recommendations to government. The three key points that emerged were 1) that racism against Aboriginal and Torres Strait Islander peoples exists in Australia today, 2) that racism has a destructive impact on Aboriginal and Torres Strait Islander people's education, health and wellbeing, well beyond its immediate impact, and 3) that racism works against all agendas which aim to close the gap in health and other outcomes between Aboriginal and Torres Strait Islander peoples and otherustralians. A particular strength of the gathering was that the initiative was developed from a spirit of reconciliation by Indigenous professionals. The considerable presence of Indigenous psychologists and academics who provided valuable contributions made this a unique event. The need to address racism towards Indigenous Australians and other minority groups remains an important and appropriate undertaking for the discipline at individual and organisational levels. There are also implications for teaching, research and professional development.

Keywords: Indigenous Australians, racism, wellbeing, reconciliation

The psychology of decolonisation: How may a coloniser contribute to decolonising change?

HUYGENS, I. (University of Waikato)

In advocating and theorising decolonisation, writers have largely focused on processes undertaken by the colonised and oppressed (Freire, 1975; Smith, 1999) rather than those undertaken by the coloniser. Although coloniser groups are often called upon to theorise their own processes of change
(Kessaris, 2006), such responses are seldom found in psychological writing. Social movements, on the other hand, have targeted the dominant Anglophone group in former British colonies such as Ireland, South Africa, Australia and New Zealand, and have developed ideological and psychological interventions for change. So how may the work of social movements help to theorise the contribution of the coloniser to decolonisation work? This paper presents findings of two studies undertaken recently with Pakeha in the anti-racism and Treaty movement in Aotearoa New Zealand. Responding to requests from indigenous Maori, the Treaty educational movement has worked in community and organisational settings with the dominant Pakeha settler group to ‘honour the Treaty’ for harmonious settlement. Key interventions used by Treaty educators are (i) revisiting colonial history from an indigenous standpoint (ii) encouraging a sense of collective responsibility for dominant cultural/institutional forms and (iii) encouraging collective action by Pakeha in mutual agreement with Maori groups. Using a participatory action approach, fifty educators were invited to articulate theory about how they themselves and their target groups change. To provide evidence of the effect of such interventions, sixteen organisations were invited to recount their experiences of Treaty-focused change over 20 years. Their accounts were analysed using a critical discursive approach.

Keywords: colonisation, oppression, Treaty movement, racism

Acknowledging injustice: Redefinition of (and resistance to) the past in explaining social problems

HASTIE, B. (University of South Australia)

One of the key recommendations of the APS’s position paper on racism was that governments publicly acknowledge racism. Such an acknowledgment was recently evident in the Australian government’s apology to Indigenous peoples for past mistreatment, particularly the forced removal of Indigenous children (the ‘Stolen Generations’). This paper examines both the government’s apology and the reply speech offered by the main opposition political party. As with similar events, the apology allowed for redefinitions of the past, which suggested particular solutions to current social problems. Prime Minister Rudd’s apology acknowledged Indigenous people’s mistreatment and linked this to current Indigenous disadvantage. In contrast, Opposition Leader Nelson’s reply speech minimised Indigenous suffering and argued that this was not connected to current disadvantage. Hence, even when discriminatory past behaviour by the dominant group is publicly acknowledged, this does not necessarily result in recognition of the importance of the past for current intergroup inequality.

Keywords: racism, Indigenous, Stolen Generations, apology, intergroup inequality

The role of banal nationalism in the perpetuation of racism in South Australian schools with New Arrivals Programmes

RIGGS, D. (Flinders University), DUE, C. (University of Adelaide)

Whilst a growing number of schools within South Australia offer programmes for students who arrive in the country either as refugees or as a part of planned migration, there is competing evidence as to the success of such programmes in promoting the inclusion of these students. Importantly, whilst schools with New Arrival Programmes (NAPs) aim to support students in learning English, this may be undermined by experiences of racism within school spaces. Ethnographic observations were undertaken of the use of playground spaces by both NAP and non-NAP students in two South Australian primary schools, as well as questionnaires administered to teachers, and focus groups held with students at both schools from across a range of classes. Ethnographic observations were coded to produce quantified data in regard to the use of space by students and the degree of integration of NAP and non-NAP students. Teacher responses were coded with a focus on perceptions of racism and degree of
integration. Focus group data was analysed thematically and is reported alongside quantitative data to give depth to the snapshot provided by the quantified ethnographic and questionnaire data. Findings suggest a considerable gap between teachers’ and students’ perceptions of integration of non-NAP and NAP students and the degree of racism experienced by the latter. This, it is suggested, is exacerbated by the emphasis upon English-language acquisition on the part of teachers, an emphasis that fails to understand the impact of racism upon NAP students who may experience considerable social marginalisation both in the broader community and by individuals in the school yard. The findings from this project suggest that banal nationalism (in this instance the perception by teachers that English-language acquisition is the best and correct pathway to social inclusion) may actually function to perpetuate racism against refugee or migrant children in school spaces (by failing to examine the silencing effects that arise from experiences of racism). Suggestions are made for practical approaches to challenging marginalisation in school spaces.

**Keywords:** social marginalisation, refugees, school, migration

---

**Preparedness and response for disasters**

Chair(s): BURKE, S. (Australian Psychological Society)

This symposium consists of 4 papers and a panel discussion on current psychological preparedness and response initiatives developed in response to the Victorian bushfires in 2009, but generalisable to other disasters. The Chair will provide an overview of the framework developed to guide the mental health response for the survivors of the Victorian bushfires (organisation of a multi-professional mental health education and training working group to build capacity in the community and mental health workforce, brief overview of 3 levels of training). The first paper discusses Australian developments in psychological first aid (MC). The second paper discusses the training for health and mental health providers (level 2 and 3), and presents an Australian adaptation of an evidence-informed package for teaching skills for psychological recovery to people affected by disasters and emergencies (DF). The third paper looks at current best practice community responses to recovery after disasters (RG). The fourth paper presents a model of psychological preparedness that has been developed to assist communities dealing with the threats of natural disaster (SM). They key learning objectives of this symposium are to understand the different needs for communities that are threatened and impacted by disasters, and to learn about best-practice models of meeting the diverse needs of affected communities.

**Psychological first aid: Building community capacity following disaster and trauma**

CREAMER, M. (Australian Centre for Posttraumatic Mental Health (ACPMH), University of Melbourne)

To develop and deliver simple training for community leaders (Level 1) to better equip them in assisting members of their community in recovering from the psychological effects of
the bushfires. The Level 1 training program was developed and delivered in collaboration with Beyondblue. The aim was to enhance the ability of key members of bushfire affected communities: a) to recognise when someone may be experiencing difficulty and in need of help and support; b) to provide simple advice on recovery and to assist the affected person in accessing naturally occurring support networks; and c) to assist the affected person in identifying and accessing professional assistance if required. The material drew heavily on contemporary models of psychological first aid (PFA). Resource materials were provided for trainers, as well as for community members participating in the training. Community leaders were loosely defined as anyone within a bushfire affected community who was likely to encounter survivors either by virtue of their occupation (e.g., bar staff, hairdressers, park rangers, bank tellers) or by virtue of their role within the community (e.g., football or cricket coach, town councilor, member of Rotary, Lions, etc). A “train the trainer” model was adopted, with 12 experienced mental health practitioners completing a one-day workshop. Those trainers were then equipped to provide standard (3 hour) sessions, or shorter versions if required, for community leaders across the affected region. These sessions were then offered free (funded by the Australian Government) over the months following the fires. Community leaders are in an ideal position to identify and assist disaster affected individuals over the months following impact. Building skills among this group has potential to enhance the capacity of the community to respond not only to the current incident, but also to future disasters that may impact upon their community.

Keywords: community, disasters, trauma, training, community leaders

Levels 2 and 3: Enhancing skills in health care providers to support survivors of disaster and trauma

FORBES, D. (Psychological First Aid: Building Community Capacity Following Disaster and Trauma)

To develop and deliver training for primary health and general health providers (Level 2), as well as for specialist mental health providers (Level 3), to better equip them in managing the psychological effects of the bushfires among their patients. The Level 2 resource, known as Skills for Psychological Recovery (SPR), was adapted by ACPMH from an original manual developed in the US by the National Center for PTSD and the National Child Traumatic Stress Network. SPR is an evidence informed approach comprising six specific modules for use by general health and welfare providers. It is designed to be offered in any setting and for any number of sessions from one to five. The Level 3 resource was designed by ACPMH to train mental health providers in evidence based treatments for a range of posttraumatic mental health problems. It comprises seven modules covering core cognitive behavioural interventions commonly used in various combinations to treat high prevalence conditions in the aftermath of trauma. Separate workshops and manuals were developed for adults and children/adolescents. A “train the trainer” model was adopted for Level 2, with 32 experienced mental health practitioners completing a two-day workshop. Those trainers then conducted 23 one-day workshops across Victoria over the subsequent three months, with around 300 participants being trained in SPR. Six three-day Level 3 workshops (four for practitioners working with adults and two for those working with children/adolescents) were conducted, with around 80 people attending the adult and around 40 attending the child/adolescent workshops. Workshop evaluations for both Levels of training were very positive, but log sheets completed over subsequent months showed variable use of skills learnt. Improving the skills of health and mental health providers to manage the effects of trauma is a major challenge in the aftermath of disaster. This model presents a practical approach to training large numbers of practitioners in a relatively short space of time.

Keywords: health care providers, disasters, trauma, bushfires, posttraumatic mental health problems

Community recovery from disasters

466 | Symposia
GORDON, R. (Consultant psychologist, Victorian State Emergency Recovery Plan)

To use a model of social processes initiated by disasters in communities to account for observed social phenomena and derive guidelines for managing social recovery and identifying problems in implementing them. The observation of disaster recovery in communities over twenty years forms the basis for a theory of social processes. Observations from clinical, research and participant engagement are related to impacts of threat, trauma, loss and disruption of social attachments. Subsequent pervasive psychosocial reorganisation in community members and arousal of specific survival behaviours predict social phenomena during recovery. Disrupted social attachments at impact causes intensified relatedness, heightened morale and altruism which can cause rivalry, inter-group tension and conflict in subsequent stages. These phenomena are general although varied in expression. Social recovery strategies should enable them to be modified, mitigated and pre-empted provided a future-oriented community perspective is maintained. The Victorian Black Saturday bushfires provide a natural experiment in which communities experienced similar disaster events but different social management. They provide a test of the principles and strategies of community recovery. Meetings with recovery workers, community members and professionals in 12 locations enabled comparison between where optimal social dynamics were evident, and where circumstances interfered with preferred social recovery methods. Phenomena predicted by the model in terms of supports and interferences to recovery were observed. Personal narratives and community events underline the need to anticipate community dynamics and the need for them to be managed preventively by intensive early interventions for individuals, families, groups and communities and ongoing social strategies. Important strategic priorities emerge for the management of communities and conduct of professionals in such environments. While individuals’ trauma and loss captures the imagination after disasters, the matrix of recovery is community support. The quality of recovery is determined by how the social environment is managed while people reconstruct their lives; this depends on how it is understood. The social psychology of disasters provides strategies and methods for counteracting destructive dynamics and enhancing recovery.

Keywords: community, recovery, disasters, social attachments

Psychological preparedness for Natural Disasters

MORRISSEY, S. (Griffith University)

This paper aims to provide an overview of the construct ‘psychological preparedness’, and presents the data from the initial development and validation of the Psychological Preparedness for Disaster Threat Scale (PPDTS). Natural disasters are an ubiquitous phenomenon in Australia with the past several years highlighting what is likely to be the norm over the next several decades, with climate change and its consequences a stark reality. Particularly notable disasters in Australia are bushfires, cyclones, floods, drought and earthquakes. Those weather-related events of particular relevance to community preparedness and adaptation initiatives and policies in Northern Australia are cyclones and floods. While substantial disaster mitigation infrastructure, including the services of multiple agencies and professionals in times of need, exists, there remains much to be done to more fully understand and achieve disaster preparedness and resilience in individuals and communities for recurrent natural disasters. There exists a critical need for a sensitive and valid measure of psychological preparedness for natural disasters that can be used to evaluate community vulnerability and the effectiveness of community disaster education and capacity building programs. A compelling context-specific evidence base has not been developed with respect to psychological preparedness for natural disasters. Conventional conceptualisations and measures of disaster preparedness have largely ignored the importance and mediating role of psychological preparedness. While previous research in North Queensland has provided promising findings with respect to the use of psychological preparedness interventions in
fostering community preparedness, it is essential that further research address the generalisability and the effectiveness of community education interventions incorporating psychological preparedness, and a valid measure is crucial to this goal and provides a much needed assessment tool. We are in the process of developing and validating a sensitive and standardised measure of psychological preparedness for natural disasters; this paper presents the methodology utilized and the results of the initial validation of the new measure.

Keywords: psychological preparedness, natural disasters, adaptation, community, generalisability

Prescriptive authority for psychologists: History, advances, and cautions

Chair(s): RESNICK, R. J. (Randolph-Macon College)

Discussant(s): NORCROSS, J. C. (University of Scranton)

An emerging area in clinical practice is the advancement and international interest in prescription privileges as an added competence for psychologists. The symposium will examine the history and international interest in prescription privileges for appropriately trained psychologists. Psychologists can and are being trained to safely and effectively prescribe psychoactive medications. This is a potent movement toward comprehensive psychological practice as it consolidates treatment within one psychologist who can offer both psychotherapy and pharmacotherapy to address patient needs. But, such advances are not without challenge: Will it change our identity as psychologists? How can such training be acquired? What are the ethical dilemmas that might be anticipated with this expanded competence? These issues and others will be addressed. The learning objectives of the symposium are: (1) Understand the emerging practice parameters of pharmacotherapy by psychologists; (2) Learn the clinical advantages for patients and society of combined treatment provided by psychologists; (3) Identify the probable tradeoffs and potential negative consequences of prescription privileges for psychologists (4) Learn the ethical implications of pharmacotherapy practice relating to expanded roles with patients, colleagues, consumers, and other health professions; (5) Learn the international movement and interest in prescriptive authority.

A history of the prescription privileges movement in the USA and internationally

RESNICK, R. J. (Randolph-Macon College)
A history of the prescription privileges as an emerging practice competence will be presented. Additionally, the process by which professional associations of psychologists begin their quest for this additional competence will be discussed in the context of society’s needs, the political process, and obstacles that impede such acquisition. The question of “why” psychologists should prescribe is presented in terms of the evolution of the practice of psychology and the benefit to society.

Keywords: prescription privileges, professional associations, society, practice competence

Combining psychopharmacology and psychotherapy: An integrative perspective

SAMMONS, M. T. (California School of Professional Psychology)

This presentation will address the evidence base surrounding combinations of psychotherapy and psychopharmacology for a variety of common mental disorders. Clinical strategies for combining psychotherapy and psychopharmacology will be discussed both from the perspective of the clinical literature and the experiences of a psychologist who has integrated psychopharmacology into his clinical practice for the past 15 years. From this perspective, the presenter will address potential effects on the professional practice, education, and identity of psychologists of integrating medication into a comprehensive treatment algorithm.

Keywords: psychotherapy, psychopharmacology, mental disorders, professional practice, medication

Expanding application of ethical practice in pharmacotherapy: A new frontier

CAMPBELL, L. F. (University of Georgia)

The practice of pharmacotherapy presents psychologists with important advances and applications of ethical behavior and decision making in their expanded practice environments and integrated roles. Some of the practice areas in which psychologists will expand their ethical paradigm include (1) relationship with the pharmaceutical industry, (2) consumer advertising, (3) competency in treating medically ill patients, (3) competence in diversity and multicultural practice, (4) implications for rural practice, (5) fulfilling continuing education needs, (6) effects on traditional practice, (7) informed consent, and (8) emerging consultation roles. The aim or purpose of this presentation is to describe the specific strengths and cautions of these and other new and evolving roles of psychologists as they incorporate pharmacotherapy into their practices. The roles of prescribing psychologists in hospitals, with medical patients, in consultation and collaboration with multidisciplinary health professionals introduces applications of ethical decision making and conduct that are challenging, stimulating, and that begin forging ethical thinking in concert with the continuing advances in pharmacotherapy. Psychologists in the role of prescriber only in consultation with a patient’s psychologist/psychotherapist is an example of an emerging role that requires application of ethical decision making through a new, but not incompatible lens. Other examples will be offered and discussion of the developing road map for pharmacotherapists will be conducted.

Keywords: pharmacotherapy, ethical practice, decision making, pharmaceutical industry, prescribing psychologists

Prescription privileges in the Netherlands and developments in Europe

VAN DIS, H. (University of Amsterdam)

In the Netherlands in the clinical practice of health psychology many patients are using medication. In many clinical settings health psychologists are asked to advise GPs and medical specialists about the prescription of psychotropic medication. In the Netherlands, the process of acquiring prescriptive authority started in 2005. In 2008, post doctorate master in Clinical Psychopharmacology was started in collaboration with the New Mexico State University and the Dutch Association of Psychologists (NIP). This master consists of theoretical and clinical teaching (live teacher from the USA, distance-education and skills training in the Netherlands and the USA).
initiative and lobby for legislative procedures in acquiring RxP was started in 2009. Recently, the European Association of Psychology Associations (EFPA) established a task force on Clinical Psychopharmacology: Prescriptive Authority.

Keywords: health psychology, medication, psychotropic medication, prescriptive authority, Netherlands

**Prevention of eating disorders and body image concerns**

Chair(s): FRANKO, D. (Northeastern University)

Discussant(s): WILKSCH, S. (Flinders University)

Decreasing risk and providing early intervention for eating disorders are important goals for clinicians, researchers, and educators. Because eating disorders occur across the developmental spectrum, age-appropriate tools are needed for both prevention and early intervention efforts in applied settings. Risk for eating disorders is highest in adolescence, when pubertal changes, increases in weight, and attention to appearance are prominent. Stresses associated with the transition to university have been linked to the onset of eating disorders as well. Moreover, body image concerns and eating problems have recently been identified in women who are in midlife and going through physical, lifestyle, and hormonal changes. The focus of this symposium will be to describe a variety of prevention and early intervention programs. The chairperson will introduce the audience to the topic and then describe three Internet-based programs, developed for early adolescents, high school students, and university students. Paper Two will describe the program *Happy Being Me*, a participant focused, three-class school program, based on an analysis of risk factors for body dissatisfaction and disordered eating, for young adolescent girls. Paper Three will detail a new program developed for midlife women, *Set Your Body Free*, which utilizes structured group meetings, homework, and focused group discussion to decrease body dissatisfaction and problematic eating behaviors in this group. Finally, Paper Four will summarize the development and use of the *Mental Health First Aid Guidelines for Eating Disorders*, which was recently launched on the Internet and offers information about how individuals, families and communities can help a loved one who might be developing or experiencing an eating disorder. The discussant will conclude the session by highlighting issues related to the implementation of these programs in applied
settings and describing clinical implications and future research directions. The key learning objectives of the symposium are: (1) To describe recent research on prevention and early intervention for body image concerns and eating disorders in applied settings; (2) To demonstrate and showcase a variety of developmentally-specific prevention and early intervention programs; (3) To illustrate the developmental issues to be considered when designing and implementing programs to decrease eating disorder risk in applied settings.

Decreasing risk factors for eating disorders with early, middle, and late adolescents

FRANKO, D. (Northeastern University)

With enhanced access to computers and the Internet, eating disorder prevention programs have taken advantage of these opportunities and expanded into multimedia technology. The focus of this presentation will be to describe eating disorder prevention programs for adolescents and college students that utilize the Internet to reduce risk behaviors and increase healthy eating. Three Internet-based programs, each developed for a specific developmental group, will be highlighted: Trouble on the Tightrope: In Search of Skateboard Sam, an interactive online program for early adolescents; BodiMojo, a website designed to decrease risk for eating disorders in high school students; and MyStudentBody_Nutrition, intended for university students. The paper will describe the programs, detail the randomized controlled studies carried out to test them, and highlight the results from three studies. Participants from three separate randomized controlled trials (total $N = 920$) were tested to determine the efficacy of Internet-based body image and healthy eating programs with middle school students ($n = 190$), high school students ($n = 254$), and university students ($n = 476$). Multiple measures assessing eating and exercise habits, along with measures of body image and eating disorder risk were obtained. Assessments occurred at pre-test, post-test, and three and six month follow-up. In each of the studies, significant differences were found on a variety of measures between intervention and control participants. In each case, improvements favored participants who used the psychoeducational programs, which resulted in improved body image, eating behaviors, and increased physical activity. The use of technology offers a unique opportunity for health professionals to enhance their work by providing a tailored, interactive experience to address concerns related to eating disorder prevention. Multimedia technology offers a new platform for decreasing eating disorder risk in a variety of applied settings and across the developmental lifespan.

Keywords: eating disorders, body image, eating disorder prevention programs, adolescence

Evaluation of a peer-based body image prevention program for early adolescent girls

PAXTON, S. (La Trobe University), RICHARDSON, S. (La Trobe University)

Public health prevention theory highlights the benefit of reducing potent risk factors for a disorder as a means of preventing the development of that disorder. Body dissatisfaction is a potent risk factor for use of extreme weight loss behaviours and disordered eating. Modifiable risk factors for body dissatisfaction in girls include internalization of the thin media ideal, frequent body comparisons, peer appearance conversations, and appearance teasing. The goals of this talk are to describe a school-based body dissatisfaction program based on risk factor theory, Happy Being Me, and to present a controlled evaluation of this program. Participants were 194 grade seven girls, 104 in the intervention and 90 in the control group (mean age = 12 years and 4 months). Self-report questionnaires assessed knowledge of material covered in the program, risk factors for body dissatisfaction, body dissatisfaction, disordered eating symptoms and self-esteem. Participants in the intervention group completed questionnaires prior to the intervention (T1), 1-2 weeks after intervention completion (T2) and three months after intervention completion (T3). The control group completed the questionnaires at the same time intervals. Happy Being Me is an interactive, 3-session, peer focused, program
delivered in 50 minute class periods. The intervention group reported significantly more positive outcomes than the control group on measures of intervention topic knowledge, risk factors for body dissatisfaction, body image, dietary restraint and self-esteem, at post-intervention and follow-up. In addition, girls enjoyed participation. A prevention intervention based on risk factor theory shows promise in reducing body dissatisfaction in grade seven girls over a three month period. Extended follow-up is required to examine the long-term benefits of *Happy Being Me*. In addition, further examination of the effectiveness of this program in naturalistic delivery settings is required.

Keywords: eating disorders, body dissatisfaction, self-esteem, body image, disordered eating

**Evaluation of a body image and disordered eating intervention for mid-life women**

MCLEAN, S. (La Trobe University)

A growing body of research demonstrates that body dissatisfaction and disordered eating remain at high levels in midlife women. Research indicates that a number of factors associated with these high levels in midlife are different from those associated with these problems in adolescents and young women. Therefore, women in midlife are likely to benefit from an intervention that specifically addresses these unique factors. *Set Your Body Free* is designed to do this. The goals of this talk are to describe the key elements of *Set Your Body Free* and to present a controlled evaluation of the programme outcomes. Participants were 62 women aged 30 to 60 years with high body dissatisfaction and disordered eating. Thirty-three participants were randomly assigned to the intervention group and 29 to the control (wait-list) group. Questionnaire assessments of body dissatisfaction, disordered eating, self-esteem, depression and risk factors specific for midlife women were completed prior to the intervention (T1), 1-2 weeks post-intervention (T2), 3 months post-intervention (T3) and six months post-intervention (T4). In addition, the control group completed assessments 8-10 weeks post T1, prior to being offered a place in the programme. *Set Your Body Free* is a manual-based, 8 week x 2hr, facilitated group session, cognitive behavioural therapy intervention. T1 to T2 outcomes for completers’ analyses [intervention group, n = 28 (84.8%) participants; control group, n = 25 (82.8%) participants] showed that the intervention group had large improvements in body dissatisfaction, eating environment and emotional eating, depression and cognitive reappraisal of ageing-related changes to appearance. Medium to small improvements were also present for restrained eating, external eating, self-esteem and body-related self-care. The intervention group improved significantly more than the control group on all variables. Six-month follow-up data will also be presented. The positive results of *Set Your Body Free* in reducing body dissatisfaction and disordered eating provides preliminary support for the value of offering programmes designed with the specific circumstances of midlife in mind. Further examination of predictors of outcome and extended follow-up is essential.

Keywords: disordered eating, body dissatisfaction, self-esteem, cognitive behavioural therapy, midlife

**Mental Health First Aid for Eating Disorders**

HART, L. (University of Melbourne)

Eating disorders are increasingly common and associated with high levels of impairment and distress. Despite this, very few people with a diagnosable eating disorder seek appropriate professional help. Educating the social networks of individuals with developing eating disorders to encourage their loved one to seek appropriate professional help is one avenue to increase help-seeking and early intervention. This research aimed to develop guidelines for members of the community who wish to provide mental health first aid to someone who they believe may be experiencing or developing an eating disorder. Mental health first aid is defined as the help provided to a person developing a mental health problem or in a mental health crisis. The first aid is given until appropriate professional help is received, or until the crisis resolves. The research
Symposia

involved establishing expert consensus on what constitutes best practice first aid for eating disorders through an online Delphi study. Three panels of experts (consisting of 36 clinicians, 27 caregivers and 22 consumers) rated statements that described potential first aid actions. Stringent criteria were used for accepting statements as guidelines and three rounds were completed before consensus was reached. From a total of 520 statements, 200 were endorsed as guidelines. A guideline document was developed from the endorsed statements and is now freely available to members of the public via the World Wide Web. An evaluation of the guidelines uptake and utility to web-users is currently being conducted. The guidelines represent a consensus-based resource for members of the community who wish to assist someone they know with an eating disorder. Further evaluation of their role in early intervention and increasing help-seeking in people with developing eating disorders is needed.

**Keywords:** eating disorders, mental health first aid, help-seeking, early intervention, crisis

---

**Primary care psychology: An international perspective**

Chair(s): VINES, R. (Monash University)

Primary Care Psychology is a relatively new development, both in Australia and elsewhere. Service delivery models involving appropriately trained psychologists working collaboratively with general practitioners/family physicians are key to these new developments. Practice in family medicine/general practice requires different models of early intervention and care than those traditionally used by privately practicing psychologists, or those working in the hospital or community health sector. The Professional Forum will discuss: how to maximise best practice; implementation of evidence-based outcomes for those suffering from high prevalence common mental disorders and chronic disease in our communities; why and how some current treatment models need to adapt to facilitate collaborative care between the professions; new shared-care approaches to treatment; and how to enhance post-graduate training models to ensure that specialist psychologists and GPs/family physicians are adequately equipped to work effectively together in the primary care setting. The Forum will provide an international perspective on Primary Care Psychology with speakers from Australia, the USA, Canada and the UK, and will highlight and describe progress in primary care mental health intervention in each of these countries. Comparisons will be made in terms of funding models available for the work; frequency of roll-out of collaborative care in each country and issues arising in the implementation of the shared care model; and whether training models have yet been adapted to include clinical experience in primary care prior to graduation. A “Report Card” will be provided for each country indicating “progress, threats and opportunities” relevant to primary care psychological service delivery. Problems unique to each country in relation to shared care will be outlined, both from the perspective of the psychologist and the GP/family physician, as well as current dilemmas in health policy.
development. The speakers will elaborate on these new developments and how the model enhances access to treatment for high prevalence mental disorders in metropolitan, regional and rural settings. A panel discussion will also be held in relation to optimal frameworks of collaborative care and how to facilitate the roll-out of these as part of best practice in family medicine. The key learning objective of this symposium are to provide an international perspective on: (1) How to maximise best practice in the Primary Care setting; (2) Evidence-based outcomes for those suffering from high prevalence common mental disorders and chronic disease conditions in our communities; (3) How and why some current treatment models need to adapt to facilitate collaborative care between the professions; (4) New shared-care approaches to treatment; and (5) How to enhance post-graduate training models to ensure that specialist psychologists and GPs/family physicians are adequately equipped to work effectively together in the primary care setting.

Primary care reform in Canada: a role for clinical and health psychology?

GRENIER, J. (University of Ottawa), RITCHIE P. (University of Ottawa), CHOMIENNE, M. H. (University of Ottawa)

In the past seven years Canada has invested much energy in reforming its primary health care system. This has given rise to a number of initiatives across the 10 different provinces as health care in Canada is of provincial jurisdiction. More recently, the focus has shifted on primary mental health care. Within the Canadian publicly-funded primary care system, a range of mental health interventions is offered, with the family physician at the core. Low prevalence mental disorders such as schizophrenia are generally referred to psychiatrists for pharmacological treatment. High prevalence/common mental illnesses such as depression are treated either within the public or private system. In the public system, usual care involves drug therapy and/or generic counseling delivered by the family physician. Recent primary care reform has facilitated the development of alternative service delivery models involving interdisciplinary care teams. Examples include “Shared Mental Healthcare” initiatives, which most frequently involve collaboration between family physicians, psychiatrists and mental health workers or social workers. We will present a number of these initiatives, including different funding and service delivery models. Focus will be given to the key elements that drive this movement towards change such as collaborative practice, and the professions chosen to participate as part of the core primary health care team. In addition we will describe some of the perceived obstacles in having psychology and family physicians work together. Particular attention will be given to the current role and place psychology occupies in primary care in Canada. Psychology’s place in Canadian Primary Care will be contrasted with that of psychology’s contributions in Australia’s Medicare. We will also present the latest developments in training opportunities for family medicine and psychology residents working together. A “Report Card” will be provided indicating “progress, threats and opportunities” relevant to primary care psychological service delivery. Problems unique to Canada in relation to shared care will be outlined, both from the perspective of the psychologist and the family physician, as well as current dilemmas in health policy development.

Keywords: Canada, primary health care, primary care reform, shared mental healthcare, family physician

Australian Primary Mental Health Reforms - overview, evaluation and international implications

BLASHKI, G. (University of Melbourne), PIRKIS, J. (University of Melbourne), FLETCHER, J. (University of Melbourne), BASSILIOS, B. (The University of Melbourne), KING, K. (University of Melbourne), RAMADAN, R. (University of Melbourne), KOHN, F. (University of Melbourne)

The aims of the presentation are to describe Australian primary mental health care reforms over the last decade, to overview the evaluation findings, and to reflect on the implications for reforms for the United Kingdom and Canada. We describe the Better Outcomes in Mental Health Care and the
Better Access to Mental Health programs, and present selected evaluation findings from successive evaluation reports. We also describe a supplementary program, the Mental Health Professionals Network, and how it is facilitating local interdisciplinary collaboration between mental health professionals. We will present evaluation findings including the implications of different models of care, the experiences of health practitioners and some patient outcome data. Australian primary mental health reforms represent a substantial national investment in improving access to high quality mental health care. There may be lessons from the Australian experience for Canadian and United Kingdom reforms as they strive to address the same challenges.

Primary Care Psychology in the United States

BRAY, J. (Baylor College of Medicine/American Psychological Association)

The practice of psychology is at an important juncture and is in the process of evolution and change to meet the needs for our population in the 21st century. Primary care psychology is an exciting new area for the profession. In the U.S., primary care providers treat over 70 percent of mental health problems, without assistance from psychologists or any other mental health providers. Primary care providers are the de facto mental health system due to policies and over-reliance on medications. Research indicates major health problems, such as diabetes, heart disease and obesity, are due to psychosocial and lifestyle problems -- issues that are not effectively addressed by the medical profession. Psychologists are often not involved in preventing and treating these problems because we are not seen as an integral part of the health-care team. The opportunities in primary care psychology necessitate additional knowledge of primary care and different skills in caring for primary care patients that reflect the evolution of psychology from being a mental health profession to a full partner in the health professions. This presentation will discuss (1) the present status of psychologists working in primary care in the United States and its relationship to the health care reforms that are occurring; (2) practice opportunities in primary care in private and public settings; (3) how to market your practice to primary care providers; (4) the use of technology and electronic health records in primary care practice; and (5) future challenges in developing integrated health care systems and training models for the future of psychology practice.

Problem solving appraisal and psychological adjustment in a global context

Chair(s): HEPPNER, P. (University of Missouri)

Ever since Dewey’s influential publication of ‘How We Think’ (1933), there has been a strong focus in psychology on how people cope with and solve difficult life problems. In fact, the focus on coping and applied problem solving has been one of the most intensely investigated topics in United States (US) in the last two decades (Skinner, et al, 2004). This symposium focuses on the cultural generalizability of the most frequently used applied problem solving in the US, the Problem Solving Inventory (PSI; Heppner & Pedersen, 1982); the PSI measures a person’s appraisal of their problem solving abilities and attitudes (i.e., their self-evaluative capacity to resolve problems). Briefly, the PSI consists of three factors: (a) Problem-Solving Confidence (b) Approach-Avoidance Style, and (c) Personal Control. Over 130 studies (see Heppner, Witty & Dixon, 2004), support the construct, convergent, and discriminant validity of the PSI. The research clearly suggests that people’s appraisal of their problem-solving ability is related to a wide range of psychological adjustment and physical health indices, to the approach they use in coping with stressful problems, and to their resolution of educational and vocational issues. For example, generally speaking, people who have a more positive appraisal of their problem-solving skills are more likely to report a positive self-concept, higher levels of self-efficacy, more social support, and lower levels of depression, anxiety, suicidal ideation, social uneasiness, and irrational beliefs. Nonetheless, what we know about problem-solving appraisal is based on primarily White U.S. samples. This symposium significantly extends the literature by examining the external validity or generalizability of the PSI to four countries with quite different cultural contexts: Australia, China, Italy, and Taiwan. Key learning objectives of the symposium are to: (a) acquire current knowledge about the PSI research literature and its role in psychological, physical, vocational adjustment; (b) learn about the generalizability of the PSI to four other cultural contexts as indicated above; (c) be sensitized to the cultural context in transporting psychological inventories across different cultures, and (d) learn about future research directions as well clinical applications of the PSI.

A literature review of the Problem Solving Inventory: Conclusions, implications, and future directions

HEPPNER, P. (University of Missouri)

The first presentation will provide an historical background of the development of the PSI as well as overview of the PSI research literature from the last 28 years; most importantly, this presentation provides the context for the following four presentations. The research will be summarized in four major categories: psychosocial adjustment, physical adjustment, coping strategies, and career development. For example, over 80 studies have examined relations between the PSI and psychological adjustment; a broad range of studies have suggested that problem-solving appraisal is associated with general psychological and social adjustment, depression, hopelessness and suicide potential, anxiety and worry, alcohol use and abuse, eating disorders, childhood adjustment, and childhood trauma. Over 35 studies have found that a positive problem-solving appraisal is associated with lower levels of depression; a negative appraisal of one’s problem solving abilities is strongly predictive of depression for individuals experiencing high levels of stress, but not for those experiencing low levels of stress. A negative problem-solving appraisal is associated with feelings of hopelessness and suicidal ideation. A person’s problem-solving confidence, in particular, is a relatively strong predictor of their feelings of hopelessness. Several conclusions from the research literature will be highlighted and discussed. For example, the research clearly suggests that people’s appraisal of their problem-solving ability is related to a wide range of psychological adjustment and physical health indices, to the approach they use in coping with stressful problems, and to their resolution
of educational and vocational issues. In essence, how people evaluate their problem-solving capabilities is in general consistent with the implementation of their problem-solving skills across a range of stressful personal problems. However, there are some exceptions. For instance, some people overestimate or underestimate their problem-solving abilities for a variety of reasons (e.g., sociopathic personality styles), resulting in a mismatch between their problem-solving appraisal and performance. Thus, problem-solving appraisal should not always be considered as synonymous with problem-solving skills. Several recommendations will be made for both clinical applications and future research, such as calling for investigations across different cultural contexts to understand the similarities and differences in applied problem solving across cultures.

Keywords: problem-solving, psychosocial adjustment, physical adjustment, coping strategies, career development

Examining the validity of the Problem Solving Inventory in Australia

BECCARIA, G. (University of Southern Queensland), MACHIN, A, (University of Southern Queensland)

The aim of this study was to: (a) test the structural validity of the PSI using CFA in two samples of students from the University of Southern Queensland (USQ), and (b) examine the relationship between the PSI and its subscales with Positive and Negative Affect, Depression and Anxiety. This study used Confirmatory Factor Analysis (CFA) to test the PSI factor structure, which is a superior method to test the construct validity of the PSI, and none published in Australia. The PSI was administered to 556 undergraduate students enrolled at USQ in 2008 and a further 497 undergraduate students enrolled at USQ in 2009. On both occasions, the PSI was part of a battery of measures; other measures included the Positive and Negative Affect Scale (Watson, Clark, & Tellegen, 1988), the Depression Stress and Anxiety Scales - 21 (Lovibond & Lovibond, 1995). Administration was via a web-based survey and students were given a choice of participation for course credit or are part of a raffle draw. The results of the CFA replicated the findings of previous research (see Heppner et al. 2004), and represented a sound fit to the model with no alterations to the original structure. Specifically, the 2008 data revealed CMIN/DF = 6.61, GFI = .94, RMSEA = .10; CFI = .96; NFI = .95; RFI = .93; PNFI = .63. The 2009 data yielded similar results, CMIN/DF = 5.6, RMSEA <.10; CFI = .96; NFI = .95; RFI = .91; PNFI = .51. The PSI and its subscales were found to significantly correlate both affect and mental health variables at $p < .01$; with correlation coefficients between $r = .29$ for AA and Negative Affect, and $r = .45$ for PSC and Depression. These findings indicate good predictive validity. This study provides strong structural validity of the PSI in the Australian population; moreover, the study suggests that the PSI is predictive of affect and mental health variables in Australian populations as well. These results suggest continued use of the PSI in Australian populations is warranted at this time. Future research directions will be discussed.

Keywords: validity, problem-solving, Australia

Examining cultural validity of the Problem-Solving Inventory in Italy

NOTA, L. (University of Padova), HEPPNER, P. (University of Missouri), FERRARI, L. (University of Padova)

The aim of this study was two-fold: (a) examining the generalizability of the PSI factor structure, and other psychometric estimates of the PSI, namely differences associated with gender, and associations with intelligence, study motivation, and use of learning strategies, and (b) examining relationships between the PSI and personality characteristics. In study 1, 15,000 Italian adolescents (5,000 from the North, 5,000 from the Center, 5,000 from the South) participated in the study; 50% were male and 50% female. The PSI, along with the Standardized Magellano Università (Soresi, 2000) battery to assess professional interests, types of interests, cultural interests, aptitudes and general intelligence, and learning strategies (e.g., time management, anxiety control, motivation). The students were also asked if they had already made a career decision to study at a university. In study 2, 577 students from the north of Italy,
32.4% male and 67.6% female, completed the PSI and Myers-Briggs Type Indicator, which assesses four personality dimensions (e.g., judging-perceiving). Study 1 found that across all three areas of Italy, the results revealed: (a) a similar but slightly different PSI factor structure (e.g., the third factor was best conceptualized as Emotional Control), (b) sex differences (which have been rarely found in U.S. samples), (c) in contrast to previous studies, the PSI accounted for 6% of the variance in intelligence, (d) a tendency to approach problems was consistently predictive of engaging in a wide range of learning strategies, and (e) significant differences were found between the decided and undecided students on all three PSI factors. Study 2 found that the students with more effective levels of problem solving also presented personality styles with strong scores on both the thinking and judging dimensions. The data set used in this investigation is the largest PSI sample ever collected in a Western European country. In addition to providing useful psychometric information for an Italian PSI, the presenter will discuss the complexities of problem-solving appraisal cross culturally as well as a few methodological caveats regarding the use of the PSI and other U.S. based inventories cross-nationally (e.g., the necessity to examine the cultural validity of assessment instruments utilized in cross-national studies).

Keywords: cultural validity, problem-solving Inventory, learning strategies, intelligence, study

Problem-solving appraisal, career indecision, and psychological adjustment in mainland China

HOU, Z. (Beijing Normal University), HEPPNER, P. (University of Missouri)

The aim of two studies conducted in Mainland China was to: (a) examine the generalizability of the factor structure of the Problem Solving Inventory (PSI) through confirmatory factor analysis among Chinese college students; and (b) examine the relationship between the PSI and both career related factors and psychological adjustment. In study 1, 736 undergraduate students from four Mainland Chinese universities were administrated the PSI, Career Decision-Making Difficulties Questionnaire (Gati et al., 1996), and Career Locus of Control (Millar & Shevlin, 2007). In study 2, 357 students from three Mainland Chinese universities completed the revised Chinese PSI and Symptom Checklist 90 (Derogatis, 1983). Study 1 found that the results indicated a poor fit of the original structure of the PSI in Mainland Chinese college student population (RMSEA= .084, GFI= .81, AGFI=.78, NNFI=0.85, CFI=.86). A slightly revised Chinese PSI (i.e., the second factor consisted of fewer but similar items as the original PSI, but now seemed to best depict Reflective Thinking; the third factor was slightly revised/conceptualized as Emotional Control) revealed a better fit to the data: RMSEA= .061, GFI=.91, NNFI=.92, CFI=.93); the relationship between the Chinese PSI and CDMD revealed more career decision-making difficulties were associated with more negative PSI scores, which is consistent with the pattern of relationships found in the U.S. The CFA results of study 2 revealed a good fit for the Chinese PSI (RMSEA= .061, GFI=.91, NNFI=.92, CFI=.93), and also found a significant relationship with the SCL-90 such that more negative PSI scores were associated with more psychological distress, which replicates findings from the U.S. The two studies suggested a slightly different construct of problem-solving appraisal in Mainland Chinese college students, subsequently labeled the Chinese PSI. The results suggest the different factor structure is stable across groups, as well as related to career related factors and psychological adjustment in expected directions. The complexity of examining the problem-solving appraisal cross-culturally and its implications will be discussed.

Keywords: problem-solving, career indecision, psychological adjustment, China, psychological distress

Applied problem solving, anxiety, and spirituality in Taiwan

HOU, Z. (Beijing Normal University), HEPPNER, P. (University of Missouri)

The aim of the study was to: (1) examine the factor structure of the well-known Problem Solving Inventory in Taiwan, (2) investigate the relations between problem solving, spirituality
and levels of state and trait anxiety among college students, and (3) determine whether the PSI, Trait anxiety, and the Spirituality Beliefs scale predicts State anxiety. Determining the role of problem solving in psychological adjustment in Taiwanese culture can provide future direction for career education programs and counseling services. 667 Taiwanese college students at National Taipei College of Business completed the PSI, State and Trait Anxiety Scale, and the Spirituality Scale. The results of the CFA provided a poor fit for the original three factor model of Heppner and Petersen (1982). Subsequently, a second CFA of the three factor Chinese PSI (Lu et al, 2009) suggested a good fit with the data: X2 = 367.89, p < .001, RMSEA=.05 (90% CI=.046 -.058), CFI = .93, and NFI=.90. Pearson correlations revealed the PSI total and factors were significantly correlated with both state and trait anxiety, specifically more negative problem solving scores were related to higher levels of anxiety; these findings replicate U.S. findings. In addition, the PSI was significantly correlated with spirituality scores revealing more positive problem solving were related to stronger spirituality beliefs; these are new findings and suggest a potentially critical link between spirituality and problem solving in dealing with important life stressors. Finally, a simultaneous regression revealed that state anxiety was predicted by trait anxiety, two PSI factors (problem solving confidence, reflective thinking) and spirituality. This study provides additional support for the revised three factor Chinese PSI in a Taiwanese population. In addition, the results provide important construct validity estimates through significant associations in theoretically consistent ways with state and trait anxiety, as well as spirituality. These results not only underscore the important role of problems solving in psychological adjustment in Taiwan, but also an important caveat to examine the cultural validity of western based inventories in East Asian cultures. Future research directions as well as clinical applications will be discussed in the presentation.

**Process issues in offending behaviour programs: Challenges and changes over time**

Chair(s): BIRGDEN, A. (Corrective Services New South Wales)

This symposium presents an overview of the therapeutic alliance and examines the importance of attending to its constituent elements during the course of treatment with forensic clients. The therapeutic alliance describes the process of engagement with clients and comprises the development and achievement of shared change goals, agreement on therapeutic tasks, and the development of a bond and the therapeutic relationship during the course of treatment (Bordin, 1979). These processes have traditionally been posited as central to the change process in general therapeutic contexts, but little empirical work has examined its relevance in correctional settings where clients often present with complex and pervasive difficulties in relatedness. This symposium will provide a unique opportunity to explore recent research on the therapeutic alliance in this context. The key learning objectives are to: explore the relevance of the therapeutic alliance in forensic settings; examine the time course of the therapeutic alliance in offending behaviour treatment from the perspective of client, clinician and observer; examine the nature of ruptures that can occur within correctional environments and responses that clinicians have to these difficulties; and to recommend practices to support clinicians in program delivery and enhance treatment outcomes for correctional clients.

**It takes two to tango: Tracking the time course of the therapeutic alliance in a violence prevention program**

ROSS, E. (Victoria University of Wellington)

The therapeutic alliance has been described as an “interpersonal dance” between therapist and client, reflecting its dynamic nature over
the course of therapy. In the treatment of high-risk violent offenders this “dance” is often lengthy and complex due to the intensive work needed to rehabilitate this challenging clientele. This presentation discusses our longitudinal research into the time-course of the therapeutic alliance formed between therapists and offenders in the 36-week Te Whare Manaakitanga violence prevention program at Rimutaka Prison in Wellington, New Zealand. We examined the time course of the therapeutic alliance across four time points of the program as rated by therapists, clients and observers. We will present data on the magnitude of differences in alliance scores between time-points, the pattern of the alliance, and whether the perspective of the rater affected these results. We compare our findings to previous research and finally we discuss the clinical and research implications of our results. The therapeutic alliance followed a linear pattern over time, increasing over the course of therapy. The magnitude of alliance scores differed by rater, but the linear pattern was shared by all raters; suggesting a shared perspective of the therapeutic alliance between therapists, clients and observers.

Keywords: therapeutic alliance, interpersonal factors, therapy, violence prevention, longitudinal research

The therapeutic alliance and group process issues in forensic group treatment programs

PAISLEY, E. (University of Melbourne)

The aim of the research project was to elucidate qualitative data from clinicians regarding the ways in which they respond to or manage difficult forensic clients or difficult situations which occur in the context of group treatment programs. In other words, the study was designed to gather information regarding the way in which clinicians negotiate therapeutic alliance ruptures. It was an exploratory study and the examination took the form of a questionnaire completed by therapists and a subsequent analysis of the data using an inductive and deductive thematic analysis approach. There were 14 therapists who participated in this study, comprising 10 psychologists, three provisional psychologists and one social worker. There were four male and 10 female therapists. Participants were from diverse backgrounds including mental health, correctional and community settings. The analysis of the 14 questionnaires suggested the major finding that regardless of theoretical orientation, there was a recognition that process issues were an important component of group therapy and one that can be utilized by therapists to enhance treatment outcome. The majority of therapists acknowledged that this was a difficult aspect of group therapy which requires skill, guidance and supervision in order to manage these processes well. It is recommended that further research is conducted in this area to improve our understanding of group therapy and develop a practical manual (in addition to existing theory manuals) to assist therapists manage group process issues. Such research and manuals might facilitate the delivery of more effective interventions in forensic settings by increasing therapist skill, confidence and optimum treatment outcomes. The findings of this research project may contribute toward understanding the nature of the therapeutic alliance, the mechanisms that underlie this relationship and developing the “if-then” specifications or ways of repairing alliance ruptures. It is hoped that this project and similar research may improve our understanding of the psychological processes in groups, result in better outcomes for those offenders that undertake group treatment programs and ultimately reduce the risk of recidivism.

Keywords: forensic settings, group treatment programs, therapeutic alliance, thematic analysis, psychological processes

The process of rupture repair in offending behaviour programs: If I care, will it make a difference?

KOZAR, C. (Deakin University)

The nature and quality of the therapeutic relationship is widely regarded as central to the change process in therapeutic interventions. A multitude of factors exist in forming effective alliances in the delivery of offending behaviour programs, but this is an area that has not been widely empirically
investigated. In this paper, the findings of a series of focus groups with correctional program providers are presented. 27 clinicians who delivered offending behaviour programs described their experiences of the therapeutic alliance. Four main areas in which ruptures could emanate were identified in focus groups: the context; the clients; co-facilitators; and the clinicians themselves. Strategies to respond to these difficulties are discussed, with particular attention paid to relating to those clients who demonstrate traits of personality disorder. Recommendations to improve the quality of the therapeutic alliance in forensic populations are presented.

Keywords: therapeutic intervention, offending behaviour, correctional facility, therapeutic alliance, personality disorders

Processes related to forgiveness following interpersonal and intergroup transgressions

Chair(s): WERTHEIM, E. (La Trobe University), BRETHERTON, D. (University of Queensland)

The last decade has seen an upsurge of research interest into the process of forgiveness. Forgiveness takes place in the face of a perceived hurt or transgression carried out by another person or group. The process of forgiveness can be seen as a letting go of negative thoughts, feelings, and motivations towards the offending party and replacing them with more positive thoughts, feelings, and motivations. In this symposium four papers are presented which approach the process of forgiveness from different vantage points. Both interpersonal forgiveness and intergroup forgiveness processes are addressed, and research methods cover interviews, survey methodology, and laboratory studies. The symposium begins with an interview study in which a range of people reported on hurtful interpersonal incidents that were forgiven and incidents that were not forgiven. Semi-structured interviews resulted in the identification of a broad range of themes of what results in forgiving others. The second paper describes in two large adult samples the development and testing of a factors related to forgiveness measure. The ability of those factors to predict forgiveness of a specific interpersonal transgression is tested and supported. Two further papers focus on the process of intergroup forgiveness. The first addresses the relationship between forgiveness and justice. Forgiveness is often assumed to require the sacrificing of justice standards. In this paper two important distinctions are made. The first distinction involves contrasting the traditional view of retributive justice with a restorative justice approach. The second distinction is between forgiveness as a sentiment versus an act. Two laboratory studies are presented exploring the influence of status/power and the questioning of presumably shared values in the
process of forgiveness. The final paper examines forgiveness in the specific context of Indigenous Australians. An important event took place in 2008 when the Australian government provided a formal apology to Indigenous Australians related to the Stolen Generations. In this paper, Indigenous responses to the apology are described, and the relevance of forgiveness in the context of Indigenous – White Australian relations is discussed. Themes arising across the different papers will be highlighted, including the crossover of findings and theory from the interpersonal to the intergroup context.

An interview study into factors related to forgiving others for interpersonal transgressions

WERTHEIM, E. (La Trobe University), HODGSON, L. (La Trobe University), BLATT, L. (La Trobe University)

The aim of this paper is to introduce the concept of forgiveness by exploring how individuals describe the factors that promote and inhibit forgiving others after hurtful interpersonal transgressions. The study was designed to be hypothesis-generating, qualitative, and descriptive; and to obtain in-depth information from a diverse group of people across a range of interpersonal transgression contexts about what they perceived to be the most important elements resulting in forgiving or not forgiving others. Participants were recruited through a social network/snowball technique originating from four researchers; through advertisements in a university newsletter; and as a response to a radio interview of the first author. The interview sample consisted of 31 participants (36% male, 64% female), who ranged in age from 19 to 64 years. Participants represented a range of education levels, marital status, religions, country of birth, and occupations. Participants were interviewed by one of five interviewers in a semi-structured interview (1 to 1 ½ hours) asking participants to describe and then discuss an incident when they felt wrongly treated by someone else, felt hurt and did not forgive the offending person. The description of this incident was followed by their discussing a parallel incident and its aftermath when the participant did forgive the offender. In each case semi-structured questions aimed to uncover barriers and inhibitors of forgiving in those two situations. Interviews were transcribed and each interview was analysed by two researchers. Participants reported a wide range of incidents covering organisational, friendship, family, marital and stranger offences, and which involving perceived lying, betraying, breaking trust, critical remarks, unfair actions, relationship breakup, affairs, assault, and business sabotage. Facilitators and barriers to forgiving were separated into three main categories, including offender-related factors (e.g., apology, perceived benign intent); victim-related (e.g., perspective taking) and external factors (e.g., time passing, helpful third parties). A broad range of factors perceived by individuals to be factors inhibiting or promoting forgiveness were reported suggesting that forgiveness is a multi-factorial process. The next step in research needed is to develop a quantitative measure of these factors and assess their relative importance in a larger sample.

Keywords: forgiveness, interpersonal transgressions, inhibitors, promotion

Development of a model and measure of social-cognitive factors predictive of forgiveness

BLATT, L. (La Trobe University), WERTHEIM, E. (La Trobe University)

Although researchers have attempted to examine various factors that predict forgiveness following a specific offence, such as relationship factors, positive offender responses, and victim beliefs about the offender, there have been few attempts at incorporating these factors into an overall model of factors associated with interpersonal forgiveness. The aim of this research was to examine a range of factors that have been asserted to predict likelihood of forgiveness following a specific interpersonal transgression. A multi-factorial conceptualization of factors predicting forgiveness is proposed and a measure developed to assess these factors, including determining the factor structure, test-retest reliability construct validity and incremental
validity. Two samples were recruited (total N > 500), the first using a social networking/snowball approach. The second sample was recruited through further networking, a university psychology department participant registry, and wellbeing workshops. Volunteers completed an anonymous online questionnaire or a paper format questionnaire. Participants described a specific time when someone had hurt them; participants then answered questions related to hurtfulness of the incident, and a series of items covering characteristics of the offender or offence and beliefs about forgiving the offender. Other measures included Transgression Related Interpersonal Motivations Inventory, Heartland Forgiveness Scale, Forgiving others subscale, neuroticism and agreeableness measures, and measures to assess construct validity. A subset of participants completed the new items a second time for test-retest reliability. Initial exploratory factor analyses on sample one resulted in seven factors, which were then confirmed in sample two using confirmatory factor analysis (AMOS). Factors included belief that forgiveness means condoning, spirituality, intent of the offender, positive post-transgression offender responses, perceived likelihood of offender repeating offences, social influence and valuing the relationship. Construct validity of the factors is reported. After accounting for neuroticism, agreeableness and disposition to forgive, the new factors accounted for a substantial proportion of the variance in forgiveness levels related to a specific transgression. A new, more comprehensive, model and measure of factors related to forgiveness was developed in this research and an extended model of how those factors combine to enhance the prediction of situational forgiveness supported the model and measure.

Keywords: forgiveness, interpersonal forgiveness, interperson transgressions, Transgression Related Interpersonal Motivations Inventory, Heartland Forgiveness Scale

The justice-restoring effects of forgiveness in intergroup contexts

WENZEL, M. (Flinders University), OKIMOTO, T. G. (Yale University)

Forgiveness is often assumed to be antithetical to subjective justice, requiring the sacrificing of justice standards. In our view this notion assumes narrow understandings of justice (as retributive, not restorative) and forgiveness (as a sentiment, not an act). We argue that two symbolic implications of transgressions fuel feelings of injustice in victims: the lowering of the victim’s status/power and the questioning of presumably shared values. Forgiveness can alleviate either concern; it can give victims moral status and control, and express the expectation or hope that the offender will re-endorse shared values. Forgiveness can restore justice via either of these mechanisms, depending on the victim’s (oppositional vs. shared) identity with the offender. Recent research supported these processes in interpersonal contexts using hypothetical situations. The present research extends the analysis to intergroup contexts and uses a laboratory paradigm. Two studies were conducted with university students as participants (N = 61 and 155, respectively). The studies used the same basic paradigm, in which two groups allegedly competed against each other in an anagram task and the outgroup victimized the participant’s ingroup by unjustifiably diminishing its winnings. The ingroup then allegedly decided by vote to send a forgiving versus unforgiving message to the outgroup. Subsequently, participants rated their perceptions of status/power and value consensus, their sense of justice, anger and feelings towards the outgroup. Study Two additionally manipulated the ingroup’s status relative to the outgroup. The results consistently showed that the group’s act of forgiveness led to greater perceived justice, partially mediated by perceived status/power. In turn perceived justice was related to less anger and more liking for the outgroup. Study Two showed that the mediating role of perceived status/power was moderated by the manipulated status relation between groups, as it held most strongly for low-status groups. The results confirm the theoretical analysis. Acts of forgiveness can have beneficial effects on justice perceptions, which can contribute to the reconciliation between parties. Further, in intergroup contexts this effect of forgiveness appears mainly due to its capacity to restore
feelings of status and power in the victimized group.

Keywords: forgiveness, justice, transgressions, reconciliation, conflict

Indigenous responses to the Australian apology to the Stolen Generations

PHILPOT, C. (University of Queensland), BALVIN, N. (University of Queensland), MELLOR, D. (Deakin University), BREThERTON, D. (University of Queensland)

Although apologies for intergroup offences are frequently requested and given, psychological research has generally found these have limited effects on forgiveness. A key limitation of the extant work is that it has relied on experimental manipulations of intergroup apologies with populations unaware of existing apologies and arguably less affected by them. This approach offers experimental control, but cannot speak to the effects of group apologies for actual victim group members who are aware of apologies and committed to the causes for which they are articulated. The current paper aims to address this gap by examining Indigenous Australian responses to the Australian government’s apology to the Stolen Generations. It is hoped that this research will improve our understanding of the effects of intergroup apologies. More generally, it is hoped that this research will contribute to an understanding of the status of White-Indigenous Australian relations as a result of the apology. Semi-structured qualitative interviews were conducted with 30 Indigenous Australians from remote and urban areas across Australia. Transcripts of the interviews were analysed using the Leximancer text analysis system. Indigenous elders were invited to reflect and comment on the thematic categories, language and interpretations, with their feedback shaping the final conclusions. Concept analysis showed that participants experienced a range of different emotions when hearing the apology. Some report being moved by the apology, others report being initially cynical. Amongst remote participants there was some feeling that the apology was for “whitefellas”. Attitudes towards the apology over time were influenced both by attitudes towards government policies on Indigenous issues as well as perceptions of societal attitudes towards Indigenous people. For most participants the apology appeared to be unrelated to forgiveness for the government or White Australians. Intergroup apologies appear to affect victim groups. However, similar to existing intergroup apology research, the link between apologies and forgiveness appears weak. Furthermore, the apology appears to have limited longitudinal effects. With the passage of time, the status of White-Indigenous Australian relations appears to be determined more by the prevailing sociocultural milieu than by the existence of an apology.

Keywords: intergroup offences, forgiveness, intergroup apologies, Indigenous Australians, Stolen Generations
Progress and challenges in defining counselling psychology in Canada, China, and South Africa

Chair(s): YOUNG, R. (University of British Columbia)

From its origins in the United States, the discipline of counseling psychology has begun to expand across the globe. However, this area of applied psychology is at different stages of establishment in different nations, and the way that it has developed has varied in response to unique social and cultural situations. This symposium presents descriptions of the way that counseling psychology is being defined in three countries with very different socio-cultural contexts: Canada, China, and South Africa. The individual presentations delineate the processes by which counseling psychology is establishing itself as an area of practice in each country, highlighting some of the distinct circumstances that the discipline has faced in these nations, as well as successes in developing it as a defined area of practice. The three presentations approach the topic of counseling psychology’s emergence from somewhat different perspectives. The first presentation focuses on a formal process that was undertaken by the Canadian Psychological Association to develop a suitable definition of the discipline. The second presentation is a report of a recently conducted empirical study assessing positive and negative perceptions of counseling psychology in its early stages of development in the People’s Republic of China. The final presentation describes the ongoing debate about appropriate scope of practice and the efforts currently underway distinguishing counseling psychology from other areas of applied psychology in South Africa. Symposium attendees will develop broad understanding about the processes and issues involved in defining a specific area of applied psychology, counseling psychology, in different countries across the globe. Participants will learn about different initiatives that can be undertaken to better establish the discipline of counseling psychology in countries with very different historical traditions of counseling practice, as well as some of the challenges, debates, and negative perceptions that counseling psychology may be confronted with as it defines itself in different nations. This knowledge may be of use to practitioners who identify with counseling psychology in other regions, who wish to advance the growth of the discipline in their own countries.

Forging a definition for counselling psychology in Canada: Processes and outcomes

DOMENE, J. (University of New Brunswick)

Although counselling psychology in Canada has existed as a recognized specialization within applied psychology for over 20 years, there has been a surprising lack of consensus about how it should be defined. This paper aims to describe the socio-historical context that has contributed to this situation in Canada, such as the overlapping domains of practice between guidance counseling and counseling psychology and the lack of recognition by provincial regulatory bodies. Also described are recent efforts by members of the Canadian Psychological Association to develop a Canadian definition of counselling psychology, and the outcome of those efforts. Although the outcome of these efforts may reflect the unique Canadian context, the process may serve as a model for other countries attempting to define counselling psychology for themselves. Over the span of two years, the committee formed by the Counselling Psychology Section of the Canadian Psychological Association engaged in a comprehensive process encompassing systematic review of literature and other documentation, consultation with experts in the field, and extensive consultation with the membership of the organization. The committee succeeded in developing a specific definition of counselling psychology that reflects the Canadian context; a definition that is grounded primarily in values of agency, holism and sensitivity to diversity; but also providing guidance in terms of typical areas of practice and research. Moreover, the systematic process undertaken to form the definition ensured that all major stakeholder groups (e.g., practitioners, academics, training programs, member of related professions) had
a voice in the process. Despite historical and regulatory circumstances that increase confusion, it was possible to develop a definition of the discipline that reflected both the existing literature and the perspectives of multiple stakeholder groups. Thus, the process undertaken by the committee appears to be a successful one, and is recommended for other groups who wish to define counselling psychology in their own countries.

How people define counseling and counseling psychology: Chinese professionals’ and non-professionals’ views?

HOU, Z. J. (Beijing Normal University)

Counseling psychology has about one hundred years of history in the United States. However, it is a relatively new discipline in many Asian countries, including the People’s Republic of China. Despite the newly emerging nature of the discipline and cultural factors that pose a barrier to service delivery, counseling psychology is developing at a very rapid pace in China. This paper presents a preliminary effort to examine how individuals in China define counseling and counseling psychology, and in what situations they will be willing to see a counselor? The sample consists of (a) parents of school-aged children, (b) university aged students, and (c) professionals in a university counseling center, all residing in a large metropolitan centre in China. Semi-structured interviews and questionnaires are used to obtain a descriptive understanding of the perception of counseling and counseling psychology from professionals and non-professionals in China. Cultural factors and other environment factors will be included in the analysis. It is anticipated that the analyses will identify the various ways that Chinese adults and youth perceive counseling and counseling psychology, as well as the range of presenting problems that may lead an individual to seek counseling services, as opposed to other forms of support. Additionally, a range of cultural and environmental factors that are salient to the growth of counseling psychology in present-day China are identified. Some of these factors promote the growth of the discipline (e.g., increased urbanization resulting in loss of other forms of social support), while other factors may impede its development (e.g., reluctance to discuss family problems with outsiders). Counseling psychology is growing rapidly in China, but relatively little research has been completed to document its growth, or to understand the perceptions that professionals and the general public have about the discipline. By addressing this issue, the present study provides an empirical base for what can be done to promote continued growth and minimize problem areas in the future.

Defining counselling psychology in transitional times: The case of South Africa

WATSON, M. (Nelson Mandela Metropolitan University)

This presentation follows on from earlier research by the author which explored the historical roots of counselling psychology in South Africa, the need for counselling psychology in South Africa to transform itself as a profession, as well as an analysis by practicing counselling psychologists of perceived strengths and weaknesses of the profession. In the last two years there has been considerable public debate about the profession of counselling psychology and what its scope of practice should entail. Defining such a scope has inevitably resulted in several documents from the country’s Professional Board as well as its Counselling Division that have attempted to explore how counselling psychology may be defined differently from other psychology professions. This presentation examines the definitions of counselling psychology inherent in this latest documentation and considers such a redefinition of scope of practice against the socio-political climate in which counselling psychology in South Africa needs to make an effective impact. The redefinition of counselling psychology in South Africa is
described within a national and international context for the profession. In particular, the issue of contextualising a definition of counselling psychology against the pressing needs of a developing nation is considered. This national comparison needs to be considered against the developing international literature on the redefining of counselling psychology, as well as the similarities and differences in such redefinition that occur within different national contexts. The symposium would provide a platform for such a comparison.

Keywords: counselling psychology, South Africa, socio-political climate, professional board, developing nation

Psychoactive drugs, psychobiological health and well-being

Chair(s): PARROTT, A. (Swansea University), SCHOLEY, A. (Swinburne University)

Discussant(s): STOUGH, C. (Swinburne University)

Psychoactive drugs are consumed for a range of reasons. Many are legal compounds while others are illicit. Herbal preparations are taken for their pro-health properties, sedative compounds can engender feelings of relaxation, while stimulants are taken for euphoria and excitement. Young people are particularly at risk from stimulant drug abuse, while alcohol, nicotine, and caffeine are taken worldwide. Gender effects will also be debated. With most drugs the ‘target’ effects are accompanied by a range of unwanted ‘side’ effects. Some of these health and behavioural effects are readily apparent, whereas others are more subtle, and can only be revealed through sensitive assessment devices. Using these sophisticated tools, subtle changes in psychobiological integrity can be demonstrated following very low doses. The first aim of this symposium will be to summarize the wide range of drugs used by humans, and outline their various effects on human health and behaviour. The second aim will be to illustrate the broad range of applied psychobiological tools which have been developed to detect these effects. Neuroscience measures such as fMRI have allowed the identification of particular brain regions affected by cannabis. Cognitive test batteries have become extremely sensitive, and they can reveal subtle changes in memory and cognition following low dosage levels. EEG measures have revealed localized deficits in Ecstasy users performing a memory task, before memory deficits are behaviorally apparent. Immunocompetence can be compromised by various drugs, often accompanied by changes in the HPA axis. The use of the Internet for large population studies will also be described, with their benefits and drawbacks being debated. Each paper will focus on a particular drug type/group. However since humans often use
multiple drugs, the practical effects of polydrug combinations will also be illustrated. The learning objectives of this symposium will include a greater understanding of the effects of drugs such as cannabis, cocaine, alcohol, nicotine/tobacco, caffeine, gingko, and ginseng on human behaviour and well-being, a greater understanding of the range of tests for assessing core psychobiological functions, health, and well-being, and a greater understanding of the dynamic complexity of polydrug interactions.

Cannabis and the brain: cognitive and psychological function in adults and adolescents

SOLOWIJ, N. (Wollongong University)

There has been growing recognition that cannabis may adversely affect, particularly in relation to the development of psychosis. There are also risks to the developing brain when cannabis is used during adolescence. Over recent years, a range of applied tools have been used in studies to investigate the effects of cannabis on brain and psychological function. This paper will provide an overview of hot topics in this area. Recent studies have utilised neuroimaging techniques (structural and functional), neuropsychological tests, electrophysiological assessment, genotyping, clinical measures and prospective methods to examine psychological functioning in adult and adolescent cannabis users. Key papers will be presented and discussed. The evidence from recent research suggests that cannabis is not the benign drug it was once thought to be. Long-term heavy cannabis use results in memory impairment, structural alterations in the brain, and induction of subclinical psychotic symptoms. Cannabis is now considered to be a component cause of schizophrenia, interacting with genetic and other predispositions to precipitate the onset of the disorder in vulnerable individuals. There is evidence that its adverse effects may be greater in adolescents who use cannabis. Cannabis is not commonly used in isolation, and the effects of alcohol in particular, will be discussed in the context of effects of long-term cannabis use. A wide range of research tools may be applied to assess the impact of cannabis on the brain and on psychological function and well-being. These multidisciplinary approaches can combine to provide a detailed understanding of the effects of cannabis and the resultant knowledge can inform policy, education and prevention strategies as well as treatment and interventions for clinical samples of cannabis users and people with or at risk of developing schizophrenia.

Keywords: cannabis, schizophrenia, alcohol, psychological function

Positive psychoactive effects of Ginseng

SCHOLEY, A. (Swinburne University)

Over the past decade or so there has been an increasing number of studies examining the biobehavioural effects of administration of plant extracts to humans. Many of these have revealed properties which may be applicable to various psychological disorders ranging from workplace stress to dementia. The plant extracts include some which have been used for millennia in traditional European, Chinese and Ayurvedic medicine systems. This paper will briefly review empirical evidence for the efficacy of species of Ginseng to improve mood and neurocognitive function in the laboratory. A series of randomised, double-blind, placebo-controlled trials have been conducted in several populations aimed at evaluating the mood and cognitive effects of standardized extracts of Panax ginseng (Asian ginseng) and Panax quinquefolius (American ginseng). Earlier studies included standardised test batteries and mood measures, while further investigations were aimed at disentangling the cognitive structures targeted by each extract. The data reveal that both Asian and American Ginseng acutely improve memory function. This improvement includes benefits to working memory, an effect supported by reduced P300 latency in EEG/event-related potential studies. The two extracts’ effects can also be differentiated based on their neurocognitive profile; specifically American ginseng differentially improves attention and increases self-rated calmness while Asian ginseng enhances secondary memory performance. It was concluded that extracts of ginseng are capable of modulating mood and cognition. Interestingly their differential effects are
largely consistent with their traditional use. At a mechanistic level the effects may be related to differential glycaemic effects of individual ginsenosides. Future studies might usefully be directed at determining the extent to which Ginseng and similar natural products are capable of reversing cognitive deficits associated with pathological disorders and long-term drug use.

Keywords: Ginseng, Memory function, working memory, cognitive deficits, drug use

Gender variation in response to stress and drug cues in cocaine dependent and alcohol dependent individuals

FOX, H. (Yale University)

Cocaine and alcohol dependence are both characterized by robust stress and reward system dysregulation, which not only underlies the development of dependence and addiction, but is also gender-specific. These neuroadaptations to stress and reward system function in cocaine dependent (CD) and alcohol dependent (AD) men and women have been assessed using a wide range of psychobiological tools, including clinical assessments, physiological measures, neuroendocrine markers and selective neurocognitive tests. The following paper outlines studies that have assessed gender variation in emotional, physiological, neuroendocrine and cognitive response to the stress and drug-cues in CD and AD patients. A series of studies will be presented where early abstinent CD and AD men and women are exposed to stress and drug-cue related personalized guided imagery scenarios. Cocaine and alcohol craving assessments are collected as well as various indices of stress system response at baseline, immediately following imagery and at various recovery time-points. Measures include subjective ratings (cocaine/ alcohol craving, anxiety, mood) physiological measures (heart rate and blood pressure) neuroendocrine markers (ACTH, Cortisol, norepinephrine and epinephrine) and cognitive measures (stroop, RAVLT). Findings from various studies broadly indicate that increases in stress and cue-induced craving are accompanied by significantly different changes in ACTH, cortisol, NE, EPI, anxiety, mood and cognition between substance abusing men and substance abusing women. As these stress-system changes are associated with relapse factors in both CD and AD populations, this variation has important implications for the development of gender-specific treatments. Findings highlight how different psychobiological measures may vary between CD men and women with regard to predicting relapse vulnerability (craving) and treatment outcome. This emphasizes the need for the application of a wide range of psychobiological tools and research paradigms when addressing gender variation in addictive populations.

Keywords: cocaine, alcohol, gender, craving, addiction

Cigarette smoking: real world studies into the psychobiological effects of nicotine dependency

PARROTT, A. (Swansea University)

In laboratory studies, it is often unclear whether nicotine improves psychobiological functioning, or whether the apparent benefits only reflect the reversal of nicotine-withdrawal effects. In order to empirically investigate this conundrum, the effects of nicotine-withdrawal and nicotine-reinstatement were empirically investigated with everyday smokers in the real world. A 12 year programme of real world studies was undertaken, where cigarette smokers were monitored as they followed their normal daily activities. Psychological measures of mood and cognition were taken before and after each incidence of cigarette smoking. This allowed the effects of nicotine and withdrawal to be routinely measured. In some studies, cigarettes were smoked ‘ad libitum’. In others, smokers abstained for a defined period of time, before smoking their cigarettes again. Cognitive tests of memory and attention were employed in several studies. The latter studies involved Internet sampling. Prospective ‘real time’ measures were also employed, education leaflets were developed, and a smoking cessation clinic was established. In every study, smokers’ psychological status was markedly impaired by nicotine deprivation, with significant impairments in stress, alertness, depression,
and cognition. Nicotine restoration then led to improvements in all these functions. However crucially, performance following nicotine reinstatement was at normal levels. Hence there was no evidence for any true psychobiological gains with nicotine. Furthermore, in unrestrained smokers, average daily performance was often worse than non-smokers. Indeed regular smokers reported significantly higher stress and depression, and worse memories, than non-smoker controls. This is probably due to repeated experience of negative moods, and information processing difficulties, in between cigarettes. The mood and cognitive effects of co-drugs such as caffeine and alcohol, in dependent tobacco smokers, will also be briefly noted and debated. It was concluded that cigarette smoking causes a wide range of psychobiological deficits. These are associated with the regular and cyclical experience of unpleasant nicotine-withdrawal phenomena.

When smokers were informed of this explanatory model, using a brief information leaflet, attitudes and knowledge about nicotine dependency and cigarette usage improved markedly. These same leaflets may also help to improve the success rates of smoking cessation programmes.

Psychoeducation to assist couple relationships and parenting

Chair(s): HALFORD, K. (University of Queensland)

This symposium presents a series of four papers that seek to enhance couples’ relationship adjustment, individual psychological well being and their parenting adjustment. Each paper describes an evaluation of an evidence based psycho-educational intervention that promotes resilience and focuses on couples in committed relationships, and seeks to make such programs available in a cost effective manner. All of the four papers address the needs of couples either making the transition to parenthood, or adjusting to parenthood in the face of challenges. The first paper describes two randomized controlled trials evaluating a brief education intervention for women at risk of post-natal depression. The second paper describes a randomized controlled trial of a couple-focused program entitled Couple CARE for parents. The third paper describes an ongoing longitudinal evaluation of a couple-focused intervention for low income families with young children. The final paper describes a replication and extension of a previous trial of Couple CARE for Parents in which the program was delivered by midwives. A common integrating theme across the presentations is that brief psychoeducational interventions can significantly enhance individual and couple’s psychological adjustment. The learning objectives are: 1) to describe the psychological challenges confronting couples becoming parents, and how psychoeducational programs can assist couples to co-parent successfully, and 2) to analyze the available evidence on the efficacy, effectiveness and cost-effectiveness of these psychoeducational interventions.

Towards parenthood - a public health intervention to prepare for the changes and challenges of a new baby

MILGROM, J. (University of Melbourne and Parent-Infant Research Institute, Austin Health)
This antenatal intervention was designed to prevent early parenting difficulties and minimize the impact of mood disorders in women at low and high risk of depression. It was created to address the needs of a broad population of women serviced by public maternity hospitals as a self-directed guidebook supported by telephone calls. The intervention targets were selected based on clinical wisdom and an exhaustive empirical review of risk factors impacting on parenting outcomes. An extensive review of existing local and international parenting support programs was also conducted. Focus groups and pilot studies were conducted to confirm acceptability. Expectant mothers and their partners received a self-directed learning guidebook comprising six units addressing the following issues: transition to parenthood, partner difficulties, coping with life stress, family of origin experiences, antenatal attachment to fetus, practical parenting skills. Fortnightly phone calls from a psychologist were provided to monitor compliance and engagement with content. The format included interactive exercises, partner involvement and cartoons. Two randomized controlled trials were conducted to compare women at risk of antenatal depression receiving the intervention with those who did not, on a range of questionnaires including the Beck Depression Inventory (BDI) and the Parenting Stress Index. Partners were also included. A similar comparison was made for non-depressed women. In the initial study, 200 women were randomized and effectiveness of the program was demonstrated despite low compliance with telephone sessions. Changes on the Beck Depression Inventory and Parenting Stress Index were found. Refinements of the intervention to increase compliance were followed by a second evaluation (n = 150) and intervention benefits for both depressed and non-depressed women were found, with largest changes in BDI score the higher the score at entry. Parenting stress also decreased and partners self-rated as less depressed and stressed in the postnatal period. Self-directed minimal intervention in the antenatal period is a useful health intervention for women at risk of antenatal depression.

Keywords: parenthood, mood disorders, women, depression, interventions

Promoting a positive transition to parenthood: A randomized clinical trial of couple relationship education

PETCH, J. (University of Queensland)

The transition to parenthood is often associated with a decline in couple relationship adjustment. The current study evaluated the Couple CARE for Parents program, an innovative couple-focused program for couples expecting their first child. Couples (n = 71) expecting their first child were randomly assigned to either: (a) Becoming a Parent (BAP), a maternal parenting education program; or (b) Couple CARE for Parents (CCP), a couple relationship and parenting education program. Couples were assessed pre-intervention (last trimester of pregnancy), post-intervention (5 months postpartum), and follow-up (12 months postpartum). Relative to BAP, CCP reduced negative couple communication from pre-intervention to both post-intervention and prevented erosion of relationship adjustment and self-regulation in women but not men from pre-intervention to follow-up. Mean parenting stress reflected positive adjustment to parenthood with no differences between BAP and CCP. CCP shows promise as a brief program that can enhance couple communication and women’s adjustment to parenthood. However, its cost effectiveness relative to other potential modes of supporting new parents needs to be investigated.

Keywords: transition, parenthood, relationship adjustment, parents program, communication

The PREP program for low-income couples with children: Preliminary results from a randomized clinical trial.

MARKMAN, H. (Denver University)

Maintaining a healthy and stable relationship under ideal circumstances is challenging. This difficulty is compounded when couples are under economic stress. Teaching at risk couples skills and principles for a successful relationship can increase relationship and family stability and improve adult well-being.
Current relationship education programs positively affect marital and relationship quality. However, these programs have primarily been offered to white, middle-class couples. There is a strong need to develop and evaluate relationship education programs for ethnically diverse groups of low-income couples and individuals. The current paper presents the preliminary results of an ongoing longitudinal study (called FRAME, Fatherhood, Relationship and Marriage Education Program) of low income couples who are in committed relationships and caring for at least one child together. Two hundred and fifty couples were randomly assigned to one of our conditions: one of three versions of the PREP program that we have developed for low income couples and individuals (traditional couples group, group for male partners, and group for female partners) or a control condition. Participants in the PREP intervention conditions attended an 18 hour workshop. We hypothesized that when compared to control couples, intervention couples would report significant gains in relationship variables and overall relationship satisfaction. We further hypothesized that participants who receive the intervention in the couples group would report relationship gains greater than those made in the individual male and female groups. The modified PREP programs teach skills for creating and maintaining healthy relationships, to cope with stress, and to enhance parenting skills. Participants completed pre, post, and follow up (up to 3 years after the intervention) self-report questionnaires designed to measure relationship quality, coping with stress, parenting, and child adjustment. Preliminary analyses revealed significant effects for relationship quality, parenting and child outcomes for all intervention groups. In addition, when only one person attends the intervention, the other partner and the relationship improves. Thus, as the couple relationship can be enhanced even when only one partner attends, suggesting a transfer effect that argues for having only person in the room when the other cannot or will not attend. Principles of how to disseminate the program on a population wide basis will be described, drawing on our work with other populations (foster parents, prisons, religious organizations, the military).

Keywords: relationship, economic stress, family stability, well-being, education

Evaluation of midwife-delivered couple psychoducation to enhance couples’ relationships and adjustment to parenthood

HALFORD, K. (University of Queensland)

Couple relationship education (CRE) for the transition to parenthood shows promise in preventing relationship distress and couple communication negativity commonly observed among couples becoming parents. However, incorporating such programs into routine care is likely to necessitate program implementation by those who provide much of the antenatal and post natal care. The current study evaluated the effects of training midwives to deliver the Couple CARE for Parents program. Nine midwife educators were trained and supervised in the delivery of the Couple CARE for Parents (CCP) which in a prior evaluation prevented relationship maladjustment when delivered by a psychologist. Couples (n = 263) expecting their first child were randomly assigned to either: (a) Becoming a Parent (BAP), a maternal parenting education program; or (b) Couple CARE for Parents (CCP), a couple relationship and parenting education program. Couples were assessed pre-intervention (last trimester of pregnancy), post-intervention (4 months postpartum), and at follow-up (16 and 28 months postpartum). Consistent with the previous study, relative to BAP, CPP significantly enhanced couple communication. Results from the current and the psychologist-delivered CCP trial will be compared. Midwives can successfully deliver most elements of a brief psychoeducational program for expectant parents. The implications for future dissemination of the program will.

Psychological and demographic factors influencing rider behaviour and accident risk among Australian motorcycle riders

Chair(s): ZINKIEWICZ, L. (School of Psychology, Deakin University)

Discussant(s): WIG, P. (School of Psychology, Deakin University)

As is well established in the international road safety literature (Harrison & Christie, 2005), motorcyclists are overrepresented in road injury and mortality statistics. However, although considerable research has been conducted to understand factors contributing to motorcycle accidents, the majority of this research has focused upon the role of machine and environmental factors in motorcycling accidents (Elliott, Baughan, & Sexton, 2007). Of the little human factors research, the focus has been on rider demographics rather than on psychological and behavioural characteristics that may influence accident risk (Elliott et al., 2007). However, increasing interest has arisen in the role of psychological factors and riding behaviour in explaining accident likelihood. This symposium begins with a quick introduction to the literature on psychological factors and riding behaviour, then moves to four motorcycling studies recently conducted in Australia, all of which have successfully used Elliott et al.’s recently developed (2007) Motorcycle Rider Behaviour Questionnaire to measure riding behaviour. While the first study focuses on demographic differences in riding behaviour, the following three studies look at psychological variables hitherto unexplored in relation to motorcycle riding: territorial perceptions, gender roles, and psychological need for control. The symposium concludes with concluding and summarising remarks by a discussant, and an opportunity to ask questions of presenters. The key learning objectives of the symposium are: To demonstrate the utility of the Motorcycle Rider Behaviour Questionnaire in the Australian context; To illustrate the contribution of psychological variables to an understanding of motorcycle rider; behaviour and accident involvement; and to highlight the value of the internet in collecting data from Australian motorcyclists.

Testing the Motorcycle Rider Behaviour Questionnaire with Australian Motorcyclists

GOOK, L. (School of Psychology, Deakin University), MCKENNA, A. (School of Psychology, Deakin University), WIG, P. (School of Psychology, Deakin University)

The study aimed to test the utility of the recently-developed Motorcycle Rider Behaviour Questionnaire (MRBQ) (Elliott et al., 2007), developed in the UK, in an Australian context, and to investigate age, region and gender differences in riding behaviour as measured by the MRBQ. An online questionnaire was completed by 1365 motorcycle riders (195 women and 1168 men) from across Australia. This included the MRBQ, demographic items (including gender, age, and region lived and ridden in), and measures of involvement in both active accidents (where the rider was at least partly to blame) and passive accidents (where the rider was hit by another road user). Confirmatory factor analysis of the MRBQ revealed a similar factor structure to that emerging in Elliott et al.’s UK sample, with five factors again emerging: traffic errors, speeding, stunting, safety equipment wearing, and control errors. Riders living and riding in urban areas reported significantly greater speeding than did those in regional areas. Male riders performed more stunts and wore less safety equipment than did female riders, with younger male riders performing more stunts and wearing less safety equipment than did older male riders. Younger male riders also had more involvement in both active (blame) crashes and passive crashes than did older male riders. Traffic errors and stunting increased the odds of any accident involvement, with age, living in a regional area, and safety equipment wearing protective factors. Only control errors increased the odds of active accident
involvement, with age again a protective factor, while age, region, safety equipment, and (unexpectedly) control errors reducing the odds of passive accident involvement. Results were fairly consistent with those of Elliott et al. (2007) in relation to predictors of total accident involvement, with fewer predictors emerging in relation to active accident involvement. It was concluded that the MRBQ may be a useful tool to assess motorcycle rider behaviour within the Australian context.

**Keywords:** Motorcycle Rider Behaviour Questionnaire, gender differences, age, traffic errors, speeding

### Gender role influences on risky motorcycle riding behaviour among Australian motorcycle riders

MCKENNA, A. (School of Psychology, Deakin University), O’SULLIVAN, A. (School of Psychology, Deakin University)

While research has established that male motorcycle riders are involved in more accidents, and engage in more risky riding behaviour, than female riders, why this is the case is unclear. The study investigated the hitherto unexplored possibility that such gender differences may be due to the effects of gender roles on riding behaviour. 1365 licensed Australian motorcyclists completed an online questionnaire, with riding behaviour measured using the Motorcycle Rider Behaviour Questionnaire (Elliott et al., 2007) and gender roles measured using the Bem (1974) Sex-Role Inventory short form. Those engaging in the more risky riding behaviours of speeding and stunts had higher levels of masculinity than those engaging in less speeding and stunting, while those engaging in less speeding and stunting and more use of safety equipment had higher levels of femininity. Logistic regression analyses using gender roles, experience and motorcycle riding behaviours as predictors of accident involvement revealed that the strongest predictors of total accident involvement were traffic errors, speeding and stunting, with safety equipment and experience reducing the odds of accident involvement. The strongest predictors of active accident involvement were control errors and speeding, with experience and masculinity reducing the odds. The odds of being in a passive accident were reduced by age, femininity, safety equipment and (unexpectedly) control errors. When controlling for the effects of gender role, gender did not predict accident involvement, contradictory to previous motorcycling studies. When gender role and riding behaviour were taken into account, gender per se had little relationship to motorcycling accident involvement. Instead, results suggest that the effects of gender on accident involvement may be due to the effect of gender roles, which may play both a direct and indirect role in specific types of motorcycling accidents. However, while femininity appears to be protective in relation to riding behaviour and accident risk, masculinity’s role is less straightforward, with masculinity associated with more risky riding behaviour but also protective in relation to active accidents. Further research is required to clarify these findings, and to investigate the possible protective role of androgyny in relation to motorcycling.

**Keywords:** males, motorcycle riders, accidents, risky riding behaviour, gender differences

### Territorial perceptions of the motorcycle, risky rider behaviour and accident risk among Australian motorcycle riders

MITCHELL, J. (School of Psychology, Deakin University)

Fraine (2003; Fraine et al., 2007) found that car drivers who showed strong territorial relationships with their vehicle – that is, saw their car as a primary territory, similar to the home – were more likely to engage in risky driving behaviours. In order to determine whether a similar relationship existed for motorcycle riders, the present study investigated whether the motorcycle was seen in territorial terms, and the influence of such perceptions on rider behaviour and accident involvement. The sample comprised 1361 Australian licensed motorcyclists, 1166 men and 193 women, who completed the Motorcycle Rider Behaviour Questionnaire (Elliott et al., 2007), and measures of territorial perceptions of the motorcycle derived from measures used by Fraine (2003). Principal components analysis of the territoriality items
revealed that motorcyclists perceived their motorcycle as a territory, with seven components emerging: rider autonomy, motorcycle centrality, negatives of riding, motorcycle as essential, threat from other road users, motorcycle as defensible space, and identity communication. Stronger territorial perceptions emerged in younger riders. ANOVA conducted on reliable territorial components showed that stronger territorial perceptions of the motorcycle were associated with more risky riding behaviour, with perception of the motorcycle as defensible space the strongest predictor of risky riding behaviour. Binary logistical regression showed that, for accidents in which the rider accepted some blame, age was a protective factor for, and control errors increased the odds of, accident involvement, but that territorial perceptions did not predict accident involvement. Motorcyclists’ perceptions of their motorcycles were related to the territorial dimensions of centrality and bike as defensible space, along with the territorial themes of autonomy, and threat when intrusion is perceived. For accidents where the rider has accepted a degree of culpability, control errors were found to be predictive of increased accident involvement. Finally, those engaging in more risky riding behaviours had in general, stronger territorial perceptions of their motorcycle.

Keywords: territorial perceptions, motorcycle, risky riding behaviour, accident risk, autonomy

Psychological desire for control and Australian motorcyclists’ accident involvement

GERLACH, K. (School of Psychology, Deakin University)

In order to expand our knowledge of causal factors involved in motorcycle crashes, the current study explored the relationship between psychological desire for control (DC), riding behaviours (as measured by the Motorcycle Rider Behaviour Questionnaire, MRBQ), key demographic variables, sensation seeking (SS) and accident involvement. A total of 766 Australian motorcyclists who had ridden within the past 24 months (700 men and 64 women) responded to the online questionnaire. Results revealed that men and women, and those who reported using safety equipment more often compared to those using it less often, did not differ significantly in their levels of DC. However, higher levels of DC were found in those reporting lower levels of traffic and control errors and higher levels of speeding violations and stunting. Binary logistic regression analyses revealed that control errors significantly increased the odds of a rider being involved in any accident and in active accidents, while greater DC and experience significantly decreased the odds of active accident involvement, and greater age decreased the odds of passive accident involvement. Consistent with previous research, SS did not predict accident involvement. It is suggested that the seeming contradiction between DC as a protective factor in relation to active accidents, and its association with higher levels of speeding and stunting, may be due to these risky behaviours serving a purpose in making motorcyclists more skilful and safer riders. However, more research is needed to verify this suggestion.

Keywords: motorcycle, desire for control, riding behaviours, sensation seeking, accident involvement
Psychological approach to entrepreneurial success and innovation

Chair(s): GORGIEVSKI, M. (Erasmus University Rotterdam)

Discussant(s): UHLANER, L. (Nijenrode Business University)

Recognition of the importance of entrepreneurship for social and economic well-being leads to the question of how we can develop entrepreneurial potential (e.g., GEM, 2006). Traditionally, developing potential at work has been the field of Work and Organisational Psychology. However, in entrepreneurship research to date, psychology has played a very modest role. Undeservedly, because it has much to offer as it comes to explaining entrepreneurs’ behaviour. This symposium aims at providing insight into the multidimensional nature of entrepreneurial performance, its measurement, and its possible predictors. Research methods are diverse, ranging from qualitative in-depth designs to cross-cultural and multi-level quantitative survey designs. Five researchers will share with you their current, novel work on diverse topics related to different success outcomes, ranging from (subjective) economic success to company-wide innovation and quality of working of employees. The first presenter provides a broad definition of entrepreneurial success, and reports on the psychometric qualities of a new multifaceted subjective entrepreneurial success measurement instrument. The second presenter will show the results of a cross-cultural validation of another new, company level measurement instrument: the Innovative Behaviour Inventory and Innovation Support Inventory. In addition, he will provide qualitative, in-depth insight into national cultural differences in how to support innovative behaviour at work. Taking a social dynamics perspective, the third presenter will show how ownership social capital (quality of relationships amongst a team of owners) influences subjective economic business success. The fourth presenter will examine how entrepreneurs’ self-management styles influence employees’ job characteristics, in particular job control and active job situations as reported by employees. Finally, the fifth presenter will report on the relationships between on the one hand entrepreneurs’ psychological capital, work engagement and flourishing and on the other hand innovation on the personal and company level, and economic business results. Finally, the presentations will be critically reviewed by a discussant, who will start the general discussion with the audience.

Entrepreneurial success is multidimensional: Development and validation of subjective Success Scale

DEJ, D. (Technical University Dresden)

Although research indicates that subjective criteria may be better predictors of entrepreneurs’ decisions and subsequent behaviors, such as business closure, than objective entrepreneurial success criteria (e.g., company growth and financial performance), entrepreneurial success as perceived by entrepreneurs themselves has largely been neglected in the entrepreneurship literature. The goal of this study was to explore success as defined by entrepreneurs themselves and to develop and validate a scale that captures subjective perceptions of success. We hypothesized that entrepreneurs’ personal definitions of success will include manifold financial and non-financial aspects, and that the developed scale will reflect the multidimensional nature of success. We also hypothesized that achievement of important success criteria will be negatively associated with vital exhaustion and positively related to job and life satisfaction as well as to objective firm performance. Content analysis has been applied to explore definitions of success provided by 243 German and Polish business owners-managers. Based on the attained results, we developed a 5-factor Subjective Entrepreneurial Success Scale (SESS) and distributed it to 186 German entrepreneurs. Scale validity was established using structural equation modelling and establishing a nomological network of relationships. Qualitative results revealed that entrepreneurs
define success in terms of (1) company performance, (2) personal financial rewards, (3) workplace relations, (4) community impact and (5) personal fulfilment. Confirmatory factor analysis supported a 5-factor structure of the SESS (CMIN/DF = 1.69, p<.001, RMSEA=.06, CFI=.90). Scale reliabilities were satisfactory. Subjective entrepreneurial success correlated positively with job and life satisfaction, creativity and innovation and explained 13 % of variance in vital exhaustion after controlling for age and gender. In addition, the subscale (1) “company performance” related positively to employee growth while (2) “personal rewards” was associated with entrepreneurs’ annual income. No relationships were found with firm profit and revenue growth. This study contributes to entrepreneurship research by demonstrating that success goes far beyond objective financial performance. Entrepreneurs’ reports of success definitions include categories that are usually not elicited in entrepreneurship research. Furthermore, the results suggest that the proposed scale is a valid and useful instrument that captures these perceptions of success.

Keywords: entrepreneurial success, entrepreneurship, scale, perceptions, life satisfaction

Innovative behaviour of individuals and its support: The views from seven European and Asian cultures

LUKES, M. (Prague University of Economics)

This study has two aims based on a recently developed theoretical model of innovation at work, consisting of innovative behaviour, innovation outputs, and contextual determinants of innovative behaviour (including managerial, organizational and cultural support). The first aim is to cross-culturally validate the Innovative Behaviour Inventory and the Innovation Support Inventory in Eurasian cultures. The second aim is to get qualitative views on the topic from managers in different countries who are responsible for continuous improvement in their companies. The Innovative Behaviour Inventory and Innovation Support Inventory (35 items; Lukes, Stephan & Cernikova, 2009) was used on four representative samples of adult populations (N=2744) in Switzerland, Germany, Italy, and the Czech Republic. Reliability, factorial validity and criterion, convergent, discriminant and cross-cultural validity was assessed by using Cronbach’s alphas, confirmatory factor analysis, analysis of variance, correlation analysis, and measurement invariance tests. We also used the sample of N=188 employees of Russian, Chinese, and Indian subsidiaries of a multinational automotive company in order to investigate further cross-cultural validity. We additionally conducted semi-structured interviews with managers in four countries (N=61) to gain in depth information on predictors of employee innovation efforts in their companies. Both inventories are reliable and valid in European and Asian cultures. Innovative behaviour at work is conceptualized as a second-order factor that is composed of idea generation, idea search and idea communication, implementation starting activities, involving others, and overcoming obstacles. Innovative behaviour is connected to innovation outputs and is directly influenced by manager’s support that also mediates the role of organizational and cultural support. Interviews with managers illustrated cultural specifics in the continuous improvement management, e.g. importance of nonmonetary appreciation and non-linear work approach of employees in India, hardworking approach and stronger monetary focus of employees in China or the relative passivity and dependence on manager’s decisions in Russia. The study adds the value to our understanding of multi-faceted innovation process and factors influencing it and provides efficient measures enabling to identify company strengths and weaknesses related to employee innovative behaviours. It also provides new knowledge concerning national cultural differences in innovative behaviour and its support.

Keywords: innovative behaviour, Innovative Behaviour Inventory, Innovation Support Inventory, Eurasian cultures, cultural diversity

Ownership social capital and firm performance in the private firm: Evidence from a Dutch sample
This study applies the concept of organizational social capital to the ownership group in private firms. Extant research focuses primarily on the type or structure of ownership to predict various firm effects. However, especially in the private firm, owners are individual actors whose attitudes and behaviors play an integral role in the firm’s performance. Where multiple owners are involved, (which is the case in approximately half of all start-ups and established firms), the understanding of dynamics amongst the owning group becomes essential. Building on the group literature in social and organization psychology, we examine this problem. We pen the term, ownership social capital, to represent the quality of relationships amongst owners, analogous to the concept of organizational social capital (Leana & van Buren, 1999) used in the field of organization behavior to describe the quality of employee relationships. The key research question in the present study is: how does ownership social capital affect business performance? Specifically, we examine how trust and associability (willingness to subordinate individual goals to group goals) influence subjective financial performance of the business. Data was collected in 2008 via key informant telephone interviews with the director from a random stratified sample of 810 Dutch private companies. We analyzed data using OLS hierarchical regression analysis. In the overall model, in addition to firm characteristics (including size and sector) we control for aspects of ownership structure, such as number of individual owners, and family orientation. Possible moderator effects are also explored. Initial results indicate that in the overall sample, associability is a better predictor than trust of subjective financial performance. However, we find a significant interaction between trust and family orientation such that in firms with low family orientation, trust is a positive predictor of performance in contrast with those with a high family orientation, for which trust has little or no added explanatory effect. Increasing our understanding of the social dynamics among business owning groups is a fruitful new avenue if we want to increase our understanding of business success.

Keywords: organizational social capital, firm performance, private firm, attitudes

Entrepreneurs’ self-management style influences their employees’ job characteristics

STEPHAN, U. (Katholieke Universiteit Leuven)

Entrepreneurs in small and medium-sized enterprises (SMEs) are understood to create and influence the work environment of their employees. The present research examines how entrepreneurs’ self-management styles influence employees’ job characteristics. We examine job characteristics building on the job control demand model, for which prior research highlights the positive consequences of high job control/active job (vs. high job demand/job strain) for employees’ health, well-being, learning and motivation. In this multi-level study, we investigate two self-management styles of entrepreneurs, which prior studies found to predict enterprise success: proactive planning and opportunistic strategy. Proactive planning is a systematic approach to work in which plans are devised based on a thorough analysis of the work situation and in anticipation of future developments. Due to their structured approach to work, proactively planning entrepreneurs are likely to be able to delegate entire tasks to employees in line with their skills thereby enhancing employees’ job control. Opportunistic strategy is characterized by high situational responsiveness as the entrepreneur continuously interrupts his plans to take advantage of potential situational opportunities. Since frequent changes are likely to result in shifting and demanding requests upon the employees, we hypothesized that opportunistic strategy will lead to increased job demands. The sample consisted of 550 employees from 44 German SMEs operating in the information technology and gastronomy industries. Entrepreneurs’ self-management style was captured with the Action Strategy Questionnaire (Zempel, 2003). Employees rated their job characteristics using the Job Content Questionnaire (Karasek et al., 1998). Hypotheses were tested with cross-level operator analysis (CLOP, James & Williams, 2000). All analyses controlled for socio-demographic variables and firm characteristics.
Entrepreneurs’ self-management style significantly influences employees’ perception of job characteristics. As hypothesized entrepreneurs’ proactive planning is associated with higher job control and an active job situation for employees; and an opportunistic strategy with the perception of higher job demands and job strain. The present study provides evidence that entrepreneurs’ self-management styles influence employees’ perception of job characteristics. Thus training entrepreneurs especially in using proactive planning could influence their employee’s well-being and productivity by way of their job characteristics.

Keywords: entrepreneurship, self-management, employees, job control demand model, proactive planning

Entrepreneurs’ psychological capital, innovativeness and business performance

GORGIEVSKI, M. (Erasmus University Rotterdam)
Predicting entrepreneurial performance and business success remains relevant in entrepreneurship research as well as work and organizational psychology. Concerning the performance of self-employed people, the individual difference approach has prevailed to date, focusing on stable personal characteristics (e.g., Rauch & Frese, 2007, 2008). Building on positive psychology, the current study aims to take this research one step further, by investigating relationships between on the one hand entrepreneurs’ psychological capital, work engagement and flourishing and on the other hand business outcomes (innovativeness and company growth) through individual behavior (development at work and innovative behavior). Business owners (N=102) participated in a web based survey (response rate 29%). Constructs were measured using previously developed and validated scales. On the individual level these addressed psychological capital: self-efficacy (4 items, alpha = .93), optimism (3 items, alpha = .69), self-esteem (5 items, alpha = .67) and resilience (5 items, alpha = .80); work-engagement (9 items, alpha = .92); flourishing (11 items, alpha = .77); business owners’ innovative behaviour (6 items, alpha = .90); and learning at work (11 items, alpha = .92). On the firm level these were entrepreneurs’ reports of financial growth (4 items, alpha = .89); company level innovative strategy and resources (7 items, alpha = .91) and the percentage of profit derived from new products. Data were analysed using structural equation modelling. Business owners’ self-efficacy, resilience, and flourishing predicted learning at work and innovative behaviour. Optimism, self-esteem and work engagement did not predict additional variance. In turn, business owners’ learning at work and innovative behaviour predicted self-reported financial growth of the business. Business owners’ innovative behaviour also predicted the percentage of profit related to new products. The firms’ innovative strategy and resources were not predicted by innovative behaviour and learning, but related directly to flourishing. In line with previous studies showing the importance of entrepreneurs’ well-being and harmonious passion for work, this study shows that flourishing is an important concept which is directly and indirectly related to company performance. This once more underscores that a balanced and optimal well-being is key to entrepreneurial success.

Psychological approaches to aging-well

Chair(s): PAÚL, C. (UNIFAI/ICBAS-UP)
Discussant(s): PAÚL, C. (UNIFAI/ICBAS-UP)

Psychology, as a science and as a profession should have a much more important role in the field of gerontology, now mostly dominated by social and health issues. Psychology is very important to a deep understanding of the aging process and the implementation of services for old people, contributing decisively to all the three priority areas considered by the Madrid International Plan of Action on Aging: i) Aging and development; ii) Advancing health and well-being and iii) Ensuring enabling and supportive environments. In a first paper Paúl et al, after discussing a protocol to assess active aging, show the relevance of psychological determinants to active ageing. Analyzing age differences in a community based sample Ribeiro et al show how the variables associated to active aging vary with different cohorts, particularly in very old people. Also based on the WHO Active Ageing framework Browning et al examined the role of culture and gender in conceptualizations of healthy ageing and examine implications for the design of programs for older people to support healthy ageing. Social support is, according to McLaughlin et al, an important factor in maintaining health and well-being for older adults. Based on Carstensen’s socioemotional selectivity theory that proposes that older adults actively prune their social networks to maintain optimal support in the face of limitations such as physical declines, the authors show that poor mental health and sensory impairments were associated with smaller networks and lower satisfaction with support for both men and women. Finally Lima shows the relevance of group intervention (counselling and psychotherapy) with older clients in response to challenges faced by older adults in later life, benefiting people living either in individual or institutional settings. This symposium aims to focusing attention on aging issues illustrating different contributions of psychology to gerontology in the framework of Active Aging model (WHO, 2002), main psychological theories of aging (e.g. Carstensen’s socioemotional selectivity theory) and counseling and psychotherapy.

Psychological determinants of active ageing

PAÚL, C. (UNIFAI/ICBAS-UP)

Active Ageing is a process of optimization of the opportunities for health, participation and security, to increase quality of life during the process of aging (WHO, 2002). The WHO Active Aging Model comprises 6 groups of determinants Physical Environment; Social Determinants, Economic Determinants, Health and Social Services; Behavior Determinants and Personal Determinants, embedded in culture and gender. The objective of our research was i) to operationalize the concept of active aging by means of a protocol to measure which variables contribute the most for an active ageing process and ii) to be able to obtain a profile of individuals that consistently tells us which areas are in debt in order to base an intervention to optimize the process of aging. The protocol consists of different tests to measure all the dimensions considered by the model. We studied 1266 individuals (55+ years old) living in the community. We derived 8 factors, explaining 64.18% of variance: Psychological status (25, 28%); Subjective health (8, 81%); Functionality and Cognition (6.66%); SES (5.67%); Bio-behavioural Competence (5.25%); Satisfaction with Services and resources (4.51%); Personality Characteristics (4.24%) and Life style and social network (3.76%). Our data suggests that psychological determinants were the most relevant ones to explain active ageing. Based in actual theories about ageing, we discuss the protocol and the importance of psychological aspects to adaptation latter in life.

Keywords: active ageing, quality of life, aging, culture, psychological determinants

Age differences in active aging: The case of the very old

RIBEIRO, O. (*UNIFAI/ICBAS-UP and ESSUA, UA)
The aim of this study was to observe hypothetical differences between age groups of old people in Active Aging Determinants. Data from a cross sectional survey of Portuguese adults aged 55+ years and living in the community were used. The non probabilistic sample comprises 1266 autonomous people interviewed in senior clubs or local associations. The mean age was 70.32 years ($SD$: 8.66 years). We designed a protocol to measure Active Aging (2002) including variables in all the 6 areas of the WHO (2002) model. Results show that i) personal determinants (e.g. MMSE; GHQ-12; Optimism; Happiness; Loneliness); ii) behavioral determinants (grip strength, peak flow; ADL IADL); iii) social determinants (e.g. family, friends); iv) health and social services determinants (e.g. security, community services); v) economic determinants and vi) demographic determinants, vary significantly with age groups. The only exceptions of variables present in the protocol that did not differ between groups where two Personality factors from NEO-R: Neuroticism and Openness. All the variables measure with the Active Aging Protocol showed worse results as people age. Health, cognitive decline, and depression seem to be the major problems of very old people (85+). Regardless of still being autonomous and living in the community old people lose progressively their adaptation potential and psychologists should intervene earlier to prevent decline and optimize well-being.

Keywords: active ageing, cognitive decline, depression, adaptation, well-being

**Conceptualizing healthy ageing: The views of older people**

BROWNING, C. (Monash University)

The aim of this paper is to examine the views of older people to understand their perceptions of and aspirations for healthy ageing. The paper reports the findings of a large-scale collaborative focus group study of healthy aging conducted in China, Malaysia and Australia by Peking University and Monash University. Using the WHO Active Ageing framework we examined the role of culture and gender in conceptualizations of healthy ageing and examine implications for the design of programs for older people to support healthy ageing. The focus group questions explored the following issues: How older people understand ageing and healthy (happy) ageing; what are older peoples’ ideal expectations of a ‘healthy (happy) old age’; and what are older peoples’ experiences of ageing? Focus group interviews were transcribed, translated and back translated. From the China transcripts emerged the following themes: good health engaging in activities, access to good food, independence, living a peaceful life with an open mind, living a harmonious, tolerant life, and having enough money. From the Malay transcripts emerged similar themes, however Spirituality was the “trunk of the tree” that supported healthy ageing. It is important to examine cultural conceptualisations of healthy ageing in order to design appropriate programs and care for older people.

Keywords: healthy ageing, active ageing, culture, gender, China

**Social support in older men and women**

MCLAUGHLIN, D. (University of Queensland)

Social support is an important factor in maintaining health and well-being for older adults. Late adulthood is associated with declining social networks due to a number of factors, including the deaths of friends, retirement, declining physical health and decreased mobility. Carstensen’s socioemotional selectivity theory proposes that older adults actively prune their social networks to maintain optimal support in the face of limitations such as physical declines. Considerable research supports the view that women, in general, possess social support networks which may be more extensive and robust than those of men, however uncertainty exists whether these gender differences continue beyond age 70. The aim of this study was to compare social network size and satisfaction in men ($n$=2,589) and women ($n$=3,152), aged 72-78 years. Women reported significantly larger networks (Difference 1.36, 95% CI 0.89, 1.83) than men. However, being separated, divorced or single had a significantly greater impact on men’s social networks.
(Difference 0.92, 95% CI 0.17, 1.68). Poor mental health and sensory impairments were associated with smaller networks and lower satisfaction with support for both men and women.

Keywords: social support, elderly, social networks, socioemotional selectivity theory, gender

Group intervention with older adults

LIMA, M. (University of Coimbra)

The purpose of this presentation is to present the possibilities and resources to be used when conducting group intervention (counselling and psychotherapy) with older clients. Although it is still a rare topic and practice, it is, however, an important response to challenges faced by older adults in later life. After presenting a review of the current state of knowledge in this field and in order to reflect on some aspects that have not yet been the object of many studies, we present case examples, emphasizing the practical clinical decisions faced when working with older people in either individual or institutional settings. Some data on ongoing researches in this frame will be presented.

Keywords: group intervention, counselling, psychotherapy, elderly

Psychological aspects of service work

Chair(s): BRADLEY, G. (Griffith University)
Discussant(s): BROUGH, P. (Griffith University)

Service industries dominate modern economies, with as many as 75% of workers employed in the service sector in many countries. Central to the delivery of most services are the interactions that take place between employees and customers. The quality of these interactions influences satisfaction levels of both parties, and indirectly affects more remote outcomes such as customer loyalty and service employee well-being. Despite this, psychological studies of “service work” – the actions required of employees to deliver a service, either face-to-face or electronically, to a customer, client, patient or pupil - is in its infancy. Drawing on research conducted in Germany, Spain and Australia, this symposium presents four recent studies of psychological aspects of service work. The studies employ a range of methods: Speaker 1 et al. conducted qualitative analyses of real-life service interactions; Speaker 2 et al. collected self-report data from two sources (managers and subordinates); Speaker 3 et al. used audio-recorded simulated service scenarios in a factorial experimental design; and Speaker 4 conducted a field experiment to evaluate an innovative service employee training program. Analytic methods are equally varied. Notwithstanding this diversity, the four studies share a common aim: to discover ways in which service quality can be improved and service encounters can be rendered more satisfying and less stressful for the participants. Also common to several of the studies are psychological constructs such as emotional regulation, interpersonal trust, psychosocial needs, verbal and non-verbal communication skills, conflict escalation and resolution. Together, the four studies illustrate the strength and diversity of this under-studied, yet growing, field of applied psychology. Key Learning Objectives will include an understanding of contemporary theoretical and empirical developments in the study of
psychological aspects of service work. Participants will also gain knowledge of practical ways in which psychologists can intervene to improve outcomes in service delivery.

A process approach to understanding difficult dyadic call centre encounters

SPARKS, B. (Griffith University)

All service encounters are “first and foremost social encounters” (McCallum & Harrison, 1985, p. 35), involving processes of dialogue and reciprocal influence between interacting parties. Ultimately, the two-way communication between customer and employee influences psychological processes in ways that may facilitate or undermine service encounter success. Our research examines the dynamics of encounters that involve service failures, interpersonal tension and conflict, because these interactions are particularly likely to lead to customer dissatisfaction and to employee strain and eventual burnout. Principles from two approaches, grounded theory and conversation analysis were applied in this research. Telephone interactions between employees and customers that had been previously recorded by four service organisations (utility firm, local government department, financial services firm, and accommodation/tourism organisation) were examined. A theoretical sampling approach was used to select 157 of these real-life service encounters for analysis. All encounters involved disagreement or conflict between employee and customer. With the aid of the software package, NVivo 8, data were coded, and general interaction patterns identified and investigated. Three illustrative findings are cited here. First, when dealing with difficult (high emotion) interactions, service providers frequently adopted the role of “controller”, so as to better manage the interaction (and the customer). However, use of control behaviours too early in the encounter seldom succeeded in containing the customer’s high emotion, and instead often led to escalation of negativity. Second, while most difficult interactions occurred due to core service problems, the handling of the ensuing recovery process by the employee required emotion management prior to a focus on problem-solving or resolving “concrete” service problems. Third, for customers, many emotionally-charged interactions stemmed from an unfulfilled need to make sense of the situation and from perceptions of low procedural fairness. Difficult service encounters require the management of complex human needs. The development of a “skilled provider” typology is proposed. Better outcomes are likely to occur to the extent that employees (a) possess a wide repertoire of strategies, and (b) are able to engage the correct tactic, at the correct time, based on outcomes from previous strategies and appraisals of ongoing customer needs.

Keywords: service work, procedural fairness, communication, conflict, burnout

Linking service quality to manager trust in their subordinates

MARTINEZ-TUR, V. (University of Valencia)

Organizational theory has paid increasing attention to the study of trust (e.g., Kramer, 1999; Luo, 2008). Scholars usually focus their effort on subordinates as trustors. However, the consideration of other combinations of trustors and trustees expands the knowledge. Manager trust in their subordinates is critical because it facilitates the delegation and the commitment of employees (Sherony & Green, 2002). Accordingly, there is a need to examine precursors of manager trust in their subordinates. This research study is an initial step in this direction, examining the role of service quality offered by employees in manager trust. Because managers tend to focus their attention on work and instrumental goals (Kramer, 1996), services of quality offered by employees – directed to customers - can be a very important facilitator of managers’ trust in their subordinates, at least in services. In the service sector, managers are very sensitive to customer perceptions increasing the importance of the service quality employees are able to offer in their interactions with customers. More specifically, we hypothesize service quality perceived by customers will impact on manager evaluation of subordinate performance. This evaluation, in turn, will be significantly related to manager trust in their subordinates. A total of 95
Spanish work centres, devoted to the attention of intellectual disabled persons, participated in this survey study. We used two sources of data: managers of centres (N = 95) and external tutors of persons with intellectual disabilities (N = 850). Participation was anonymous for both managers and tutors. A group of tutors for each participant organization was randomly selected. Results of structural equation models were congruent with our hypotheses. Manager evaluation of employee performance plays a mediating role between service quality perceived by tutors and manager trust in their subordinates. It is confirmed that service quality is a precursor of managers’ trust in their subordinates. This research study contributes to previous trust literature examining specific antecedents of manager trust and stimulating future research efforts. A contingency approach was reinforced where specific sources of trust should be identified for managers in the service sector.

Keywords: trust, management, instrumental goals, service work, performance

Communication effectiveness within service encounters: A dyadic psychosocial needs approach.

BRADLEY, G. (Griffith University)

Numerous theoretical perspectives offer insights into the processes occurring within service encounters. The authors of this presentation have recently developed a service encounter needs theory (SENT) to explain the linkages between behaviours and outcomes within service interactions. This theory proposes the existence of eight psychosocial needs pertinent to service interactions and maintains that service encounter success varies with satisfaction of these needs. In contrast to past research that has assessed effects of service exchanges on just one of the participants, we adopt a dyadic approach: we are equally interested in outcomes for customers and employees and we argue that the same set of needs mediates the effects on both parties. This paper reports an experimental test of these propositions. The study used a 2 (role adopted: customer vs. employee) x 2 (rapport between the parties: present vs. absent) x 2 (customer expressive skills: high vs. low) x 2 (employee listening skills: high vs. low) between-groups design. The 680 participants listened to one of several versions of an audio-recording of a simulated service encounter embedded in an e-questionnaire. They were asked to adopt the perspective of one of the parties whilst listening to the recording and whilst responding to questions assessing psychosocial need fulfilment, satisfaction with the encounter, and emotional exhaustion. Multivariate analyses of variance confirmed predictions that outcomes were more favourable for both parties when exposed to the presence of rapport and high levels of employee listening skills. Participants in the role of employee evaluated the encounter more positively than did those acting as customers. Psychosocial need fulfilment mediated some of the relations between service encounter behaviours and service encounter outcomes. Moderated mediation effects were also observed, such that the mediating role of need fulfilment varied as a function of role adopted. The study has implications for service encounter theory (demonstrating the value of a psychosocial needs perspective), future research (highlighting the potential to investigate employee and customer perspectives simultaneously using an identical service scenario), and applications to the service industry (reinforcing the contribution to service encounter success of rapport-building and active listening processes).

Keywords: service work, dyadic approach, psychosocial need fulfilment

Development and evaluation of a program to train the service behaviour of customer contact employees

NEUMANN, C. (University of Rostock)

Service encounters that are characterized by low levels of complexity represent an important contingent of the encounters in personal selling. Script based training is often recommended for these encounters. This kind of training focuses mainly on observable behaviour but neglects the employee’s social abilities. We believe that the successful management of low complexity encounters
Abstracts of the 27th International Congress of Applied Psychology

Symposia

requires some level of social competence. Hennig-Thurau and Thurau (1999) suggest that social competence consists of four different abilities: verbal and nonverbal abilities, perspective taking, emotion regulation, and the ability to plan and manage customer interactions. Up until now, it has been unclear if these abilities are also essential for encounters with low complexity. Qualitative pre-studies reveal evidence that they seem to be relevant. A training program aimed at developing the four social abilities was developed. The aim of this research is the evaluation of this training program. To judge the success of the training intervention a pre/post-design with an experimental and a control group was chosen. The training was already carried out. Altogether, 43 bakery shop employees were trained and asked to give a self-report of diverse constructs. Additionally, each of the employees was judged by their superiors prior to, as well as four weeks after, the training, in order to assess their customer-oriented behaviour. The control group consisted of 50 employees. Variance analysis with repeated measures and mediation analyses were conducted. Several significant interaction effects can be seen. For example, the customer-oriented behaviours of the training group increased, while those of the control group remained stable. Also a mediator was found. The training intervention has several effects. Especially, the verbal and nonverbal abilities seem to be relevant for service encounters with low complexity.

**Psychological assessment in Brazil, Romania and South Africa**

Chair(s): OAKLAND, T. (University of Florida)

Discussant(s): OAKLAND, T. (University of Florida)

This symposium discusses the recent history and current status of psychological assessment in three countries: Brazil, Romania, and South Africa. Important historical moments together with difficulties and strategies used to stimulate test development and use will be discussed. We believe other countries may have similar histories and may benefit from the ways our problems are being resolved. Despite considerable social, historical and cultural differences between the three countries, common obstacles to the development of psychological assessment are apparent and were addressed albeit in different ways. Conceptual, theoretical, and empirical data will be used to discuss the key factors in their development. The Brazilian presentation emphasizes the efforts by the Federal Council of Psychology, Brazilian Association of Psychology Assessment, International Test Commission, tests authors, and government agencies to address impediments to psychological assessment common in the 1980s. The Romania presentation summarizes data from three surveys that characterizes the current status of assessment practices together with public and policy-maker perception of psychological assessment. This information is discussed in the context of forces that have influenced the revival of psychological assessment in Romania during the last decade. The South Africa presentation discusses the impact of prevailing international trends, watershed political events (e.g. the ill effects of the apartheid policy), and local government policies on test development and use. A rationale for a need to rethink the prevailing paradigm underpinning psychological assessment and test development and use in SA and for an inclusive approach to these matters is presented.

Psychological Assessment in Brazil
Until the 1980-decade, foreign-developed were used predominantly in Brazil. If adapted, the methods were insufficient in light to then-current psychometrics standards. Some strategies were adopted to address numerous critics made by different social segments. The evolution in psychological assessment since the 1980s will be discussed. Methods adopted or advocated by the Federal Council of Psychology (CFP), the Brazilian Institute of Psychological Assessment (IBAP), and other professional and governmental policies on test development and use together with psychological assessment will be featured. At 2001, Psychological Test Evaluating System (SATEPSI) was implemented by CFP with the purpose of evaluating all psychological tests in light of their technical properties. Tests that displayed suitable psychometric qualities (e.g. reliability, validity, norms) were certified for professional use. The initial reaction was strongly negative many quarters and had only a 51% approval rate among the 106 tests evaluated. Nevertheless, these regulations mobilized test developers and publishing companies to improve their work in light of these qualities. Government agencies provided funds to address this situation. The convergence of these efforts resulted at an accelerated growth in test development and adaptation, including an increased quality and sophistication in validity studies. For example, during 2002, the number of approved tests was approximately 55. Seven years later this number increased up to 109 tests. Many methods to increase psychologist’s knowledge of assessment also were created, including specific postgraduate program, IBAP conferences and courses, and efforts of CFP to publish materials about important issues. Although not all problems associated with test development and use together with psychological assessment in Brazil were completely addressed, great advance have been made during the last decade as a result of these efforts. For example, Brazilian psychologists now have a relatively broad and growing range of validated psychological tests to use in their work that assists in the assessment of many constructs important to Brazil’s varied contexts.

**Keywords:** psychological assessment, Brazil, psychometrics standards, test development

**Psychological assessment and test development in South Africa over the past 100 years**

MAREE, G. (University of Pretoria)

This paper discusses the prevailing impact of international trends, watershed political events (e.g. the ill effects of the apartheid policy), and local government policies on test development and use in South Africa. Scholarship and government-developed documents are used to identify and trace trends in the development and use of psychological tests in South Africa with a view to describe current conditions and provide guidelines for future development and use. The development and use of psychological tests in SA have been impacted appreciably by prevailing international trends, watershed political events, and local government policies. Furthermore, the majority of psychological tests were imported and adapted, largely for use with white clients. In addition, the now defunct apartheid system has greatly influenced assessment practices. A need exists for a more inclusive approach to psychological assessment and test development and for rethinking the current paradigm underpinning test development in South Africa. A theoretical framework that combines facets of a quantitative approach with career construction (for life designing) approaches is introduced and discussed. An open, respectful, ‘best practice’ approach seems to be in the best interests of all South Africans. The leadership of the Psychological Society of South Africa is essential to establish a better future.

**Psychological Assessment in Romania**

ILIESCU, D. (SNSPA University, Bucharest)

Psychological assessment in Romania and other Soviet-dominated countries was not widely accepted. However, a new era emerged during the 1990s. Test development and use grew significantly during last decade following
the investment of considerable intellectual, industrial, and financial resources in the country. Survey data from practitioners and the general public are used to describe the current status of psychological assessment in clinical, educational and I/O psychology. These include the assessment practices of 422 psychologists, 400 members of the public, and 100 managers of public, industrial, educational, and military institutions as to their perception of psychological assessment. Professionals generally view assessment practices to cover a large range, from those that are good to others that are unacceptable when compared with international guidelines. The public is concerned about fairness in testing practices. Perceptions by policy makers toward psychological assessment generally are positive and reflect broader issues than that found in the public’s perception. Various forces are contributing to the development of psychological assessment in Romania. These include a growing international market for tests and education, pioneering work of test publishers, support through government investment, institutional structuring (e.g. the creation of the Romanian Board of Psychology), efforts of the International Test Commission, together with other international institutions to promote good practices.

Keywords: psychological assessment, Romania, education, test development, International Test Commission

**Psychological issues in a multicultural society**

Chair(s): THOMAS, T. (RMIT University)  
Discussant(s): SOPHIA, X. (RMIT University)

Migrating to a new country with different culture is now a global phenomenon. Very few countries in the world are now mono-cultural, yet living in a multicultural society is not easy for many migrants. The main objective of the symposium is to explore issues that are important for harmony and well-being for members of a multicultural society. The symposium presents three projects on community psychology in a culturally diverse society. Projects conducted with the Filipino and Vietnamese communities in Australia are reported. The Filipino community in Australia is characterized by gender imbalance with women outnumbering men. The first paper reported a research on the acculturative issues concerning older Filipino who are living in rural and urban regions in Australia. The second paper reports on a research project conducted to identify factors that are associated with psychopathology in Filipino women who came to Australia as “Mail ordered” brides and “Grandmothers” to care for their families. The third study explores factors that influence the difficult relationship between police forces and the Vietnamese community. The Vietnamese community in Australia has been stigmatized by its crime rates and difficulty with law and order. Barriers that hinder communication, trust and understanding between the two groups are explored. A general discussion about psychological issues in a multicultural society will then be presented.

**A place to call home: Acculturation and ageing for Filipino seniors in Australia**

CICHELLO, M. (Commonwealth Department of Health)

This study investigates older Filipinos’ adaptation after migration and its impact on their ageing and general well being. The
research design addresses several issues associated with cross-cultural research including sample size, distance, language and back translation of instruments from English to Filipino. The bilingual researcher interviewed 300 Philippine-born male and female participants aged between 55 and 92 years, who are living in urban and rural communities across Australia. The questionnaires collected data on participants’ migration experiences, acculturation measures, ageing experiences, social support and psychological well-being. Quantitative data analyses highlight significant differences in demographic, gender and age cohorts within the sample group. There was a significant relationship between migration variables and ageing for both Filipino men and women. The acculturation scores indicate a bicultural sample but unexpected major differences in the acculturation patterns of ageing Filipinos residing in urban and rural regions of Australia emerged. Findings showed that age on arrival, reason for migration, education and marital status contributed significantly to the adaptation of older Filipinos to Australia. Participants who migrated at an older age disclosed more negative adjustment and ageing experiences compared to those who migrated at a younger age and grew old in Australia. Participants who migrated under Spouse visa or Family Reunion Program and settled in rural areas reported easier adjustment and higher integration. Social support correlated strongly with positive ageing experiences and high mood scores in this sample. Empirical evidence from the study will provide policy makers and service providers with an understanding of cultural and socio-psychological determinants of positive ageing in older Filipinos.

Keywords: migration, ageing, well-being, social support, cultural diversity

Working with Filipino “brides and grandmothers”: Cultural perspectives

WILKS, A. (RMIT University)

This paper discusses the factors that are associated with psychopathology in Filipino women whose community is characterised by gender imbalance because of the large migration of women who came to Australia as brides and grandmothers. This paper reports on a correlational, cross-sectional study with multivariate analysis, conducted to identify factors that are associated with psychopathology in Filipino immigrants in both metropolitan and regional areas Australia. The study was conducted in three stages, combining both qualitative and quantitative approaches in cross-cultural research. Participants include 194 older Filipino women migrants aged 50 and above. Following the stress and coping framework, the study examines the role of factors including reasons for migration, health, social roles, cohort effect, coping strategies, and social support on psychological distress. The results indicate that Filipino cultural values and norms determine the adaptive settlement and acculturation in the host country. Culture influence factors such as education, living arrangements, reason to migrate, employment, coping style, and social support that contribute significantly to positive psychological well being and ageing for this sample. Filipino cultural values inform future planning for this group of migrants whose community is characterized by gender imbalance.

Keywords: Filipino, coping strategies, gender imbalance, migration, social roles

The relationship between police and the Vietnamese Australians: challenges to intercultural communication

VIET TINH, N. (RMIT University), MCKERNAN, H. (Swinburne University)

This study explores the key factors that impede relationship and communication between the Vietnamese community and police in Australia. The study investigates police officers’ experience of professional relations with members of the Australian Vietnamese community, including their understanding of risk, trust and information gaps. Attitudes of Australian Vietnamese community members to police, crime, security and community policing are also explored. Participants included 60 police officers and 28 members of the Vietnamese community. First, semi-structured interviews with police officers from Victoria Police about their experiences with the Vietnamese community were conducted.
Secondly, the study conducted six focus groups with representatives from the Vietnamese Community. Personal and professional experiences in relation to justice and Police were discussed, as well as perceptions of local Police and satisfaction of their performances. Systematic and thematic analyses approaches were used to analyze the responses. Some early themes emerging from the data showed that language barrier remained a significant obstacle to improved relations between police and Vietnamese Australians and lack of trust existed between police and the Vietnamese community. Results from analyses of the focus groups discussions showed that historical and social conditions had some affects on the attitudes of Vietnamese people toward justice and police. There was strong relationship between the attitudes of Vietnamese people and direct/indirect contacts with police and justice. Factors that had significant influences on attitudes of Vietnamese people included education, profession and birth places. Language barrier and cultural differences were key factors in people’s willingness to report crime and cooperate with police. Years of arrival in Australia and birth places were found related to the level of satisfactions of local police. As there is a lack of trust between police and the Vietnamese community, how does Victoria Police build the skills for officers that assist them to communicate with and build relationships within Vietnamese Australian people? Further and in-depth studies with a bigger sample of Vietnamese population are clearly needed to test suggestive trends from these studies.

Keywords: communication, Vietnamese community, police, Australia, trust

**Psychological models to understand behavioral change for more sustainable lifestyles**

Chair(s): MOSLER, H. J. (Eawag), KAISER, F. G. (Otto-von-guericke University)

Discussant(s): MOSLER, H. J. (Eawag)

Psychology has a thirty-year tradition of investigating the psychological origins behind pro-environmental action. The reason for a new-born interest in these sources of individual behavior derives from the urgency of initiating behavior change on a large scale, to halt progressive environmental deterioration or, at least, to slow it down. In other words, psychology aspires to effectively change individual behavior to create more sustainable lifestyles in individuals. More precisely, the psychological origins behind pro-environmental behavior are suspected to offer the psychological leverage for change. With psychological leverages, however, it is not only their efficacy that matters, but also their malleability, and their suitability for behavior-change campaigns. Are the identified psychological forces behind action also useful for large-scale behavior-change interventions? In this symposium, we brought together colleagues interested in psychological models that are suitable to guide behavior change in various settings concerning multiple types of pro-environmental behavior. In bringing these colleagues together, we aim to discuss the efficacy but also the suitability of various psychological leverages to modify individual behavior and lifestyles. Corral-Verdugo focuses on the psychological benefits of sustainable behavior of individuals as a potential future selling argument to promote pro-environmental engagement. Hine argues for a better understanding of experiential and analytic processes behind behavior in order to develop effective interventions to promote sustainable lifestyles. Tobias recognizes reminders and commitment as the core factors behind the habituation process towards more sustainable engagement. Kaiser and Roczen develop an
environmental competence model that is expected to turn education for sustainable development into an empirically guided endeavor. Their emphasis is on environmental knowledge and appreciation for nature. Milfont and Bieniok, finally, highlight the importance of peoples’ time perspective on their attitudes and behaviors toward the environment.

**Personal and subjective well-being as correlates of sustainable behavior**

CORRAL-VERDUGO, V. (University of Sonora, Hermosillo)

The aim of this study was to investigate some positive psychological consequences of sustainable actions. The concept of sustainable behavior (SB) is defined, by framing it within the objectives of Positive Psychology (Seligman & Csikszentmihalyi, 2000) since SB is aimed at developing psychological traits and actions benefiting both the individual and her/his community. The studied positive consequences included happiness and personal well-being. The main hypothesis established that sustainable behavior, indicated by pro-ecological, altruistic, frugal, and equitable behaviors, is more frequent in people obtaining psychological benefits in the form of subjective and personal well-being. 150 individuals responded to an instrument including scales that assessed the four types of SB. Pro-ecological behavior was measured by using Kaiser’s (1998) General Ecological Behavior instrument, while altruistic, frugal and equitable actions were self-reported through scales developed by the author of this communication. The participants also responded to Lyubomirsky & Lepper’s (1999) Happiness scale and to Ryff’s (1989) Personal Well-being instrument. Results were processed through a structural equation model wherein sustainable behavior was specified as affecting the assessed positive psychological outcomes. The scales produced indicators of reliability and convergent validity, while high and significant interrelations among the pro-ecological, altruistic, frugal and equitable behaviors confirmed the presence of a higher-order SB factor. The assessed sustainable behaviors were significantly related to happiness and personal well-being.

**Environmental psychology has traditionally focused its research programs on the psychological antecedents of sustainable behavior, somehow neglecting the study of its positive psychological consequences. As this study and some others show, happiness, psychological restoration and additional positive states are more frequent in people that engage in actions that protect the physical and social environments. These results should motivate further studies on the psychological benefits of sustainable behavior.**

**Keywords:** sustainable behaviour, positive psychology, psychological traits, well-being, happiness

**The role of affect and reason in facilitating and inhibiting changes to more sustainable lifestyles**

HINE, D. (University of New England)

Dual process models assume that human decision making and behavior are guided by two distinct information processing systems: (a) an experiential system that is passive, automatic, rapid and intimately tied to affect, and (b) an analytic system that is conscious, intentional, logic based, and largely affect free. In order to encourage sustainable lifestyle choices, researchers and policy makers need to better understand how both systems operate and how they interact with each other. Findings from a series laboratory, questionnaire and field studies focusing on substance use, sexual aggression and pro-environmental behavior will be presented. Methodologies for assessing experiential and rational cognition will be highlighted, as will implications for eliciting sustainable lifestyle choices. The pattern of results across studies indicate suggest indicate that: (1) conscious beliefs regarding the benefits of positive lifestyle changes (or the costs of not making such changes) may be undermined by contrary affective output from the experiential system, and (2) individual differences in working memory capacity and thinking style predispose individuals to over-rely on the output from one system or the other, suggesting that, to be effective, sustainability initiatives will need to be carefully tailored to audience characteristics. The dual process perspective
highlights the important roles played by both experiential and analytic processes in guiding decision-making and behavior. These processes need to be better understood to develop effective interventions to promote sustainable lifestyle choices.

Keywords: dual process models, decision making, experiential system, analytic system, lifestyle

The long way to habits: Computer simulation of a campaign promoting water disinfection in Bolivia by prompts

TOBIAS, R. (Swiss Federal Institute of Aquatic Science and Technology, Dübendorf)

Behaviors of a sustainable lifestyle will only have the desired impact if repeated over long periods of time. The goal is to establish habits that lead to an enduring performance of these behaviors. However, for habits to establish, the behavior has to be performed sufficiently often. This can be difficult to reach, since persons often forget performing new behaviors at the right moment. Reminders like prompts can reduce forgetting and thus promote the development of habits. This study aims at a better understanding of how habits establish and what factors determine success and failure of this process. To investigate the complex interactions between forgetting, habit development, reminding events, and the effects of prompts, a computer model was developed based on findings in the literature. During a campaign in Bolivia, where prompts were applied to promote the use of a sustainable way to disinfect water by exposing it to sunlight, time-series data of the behavior performance were collected. By calibrating the model to these data and running system analyses, the latent processes that produce the observed behavior dynamics could be isolated. The data show that, in many cases, shortly after the start of the intervention with a sharp increase of behavior performance, the frequency of performing the behavior decays and then, within about a month, increases again. The model replicates well the empirical time series. It explains the decay with forgetting the behavior more and more often. However, the reminders used in the campaign prevented that the behavior was forgotten too often. Thus, habits could develop that, over time, increased the behavior frequency by supporting the recall of the behavior. Further analyses showed that the effect of reminders depends strongly on the commitment to perform the new behavior and decays over time. For understanding habituation, a process view has to be adopted and a number of interacting factors considered. Time-series data and computer simulation allow a formal empirical analysis of the processes involved. The model allows investigation of a number of interventions for promoting habituation and supports the planning of campaigns for sustainable behavior change.

Environmental competency: The interplay of appreciation of nature, and knowing why, what and what best

KAISER, F. (Otto-von-Guericke University Magdeburg), ROCZEN, N. (Otto-von-Guericke University Magdeburg)

Pro-environmental education and education for sustainable development traditionally aim to activate theoretically derived ecology-unspecific, general proficiencies, such as problem-solving or value-reflection abilities. Such general abilities are, however, behavior-distal and thereby often found to be empirically irrelevant to individual pro-environmental performance. By contrast, our competence model is grounded in the ecology-specific abilities environmental knowledge and appreciation for nature (i.e., connection with nature. Our sample consists of 1,922 students from seven schools. The schools were sampled from high and medium stratification high schools within the German secondary education system. The students were sampled from three different grade levels. Their average age was 13.7 (age range: from 11 to 20). Of all students, 56 percent were females. Based on cross-sectional survey data, we calibrated five ecology-specific instruments with different models from the family of Rasch models, measuring (1) environmental system knowledge, (2) action-related knowledge, (3) effectiveness knowledge, (4) appreciation for nature, and (5) general ecological behavior. All
five instruments confirmed previously established good scale characteristics in terms of item and person fit statistics. The relatively poor reliabilities of the knowledge measures are due to the generally low attainment levels of the pupils. Based on structural equation modeling, we were able to confirm the anticipated hypotheses about the interrelations among the five concepts. While knowledge revealed only a rather moderate behavior effect, people’s appreciation for nature turned out to be the expected effective predictor of pro-environmental engagement. At the same time, appreciation for nature is not only behavior-relevant but apparently also sparks curiosity to learn more about the environment. Surprisingly low was the overall level in environmental knowledge among young adolescents in Germany. Increasing the absolute extent of people’s environmental knowledge, fostering the integration, the conversion of different types of environmental knowledge, and stimulating appreciation for nature are, as we believe, three effective measures to promote sustainable patterns of behavior in individuals. Well-established concept measures will help to evaluate progress along the way, and altogether, by using an empirically derived competence model, environmental education will eventually turn into a more empirically guided endeavor to the better of humankind.

Keywords: pro-environmental education, problem-solving, ecology-specific abilities, schools, environmental knowledge

The role of psychological time in tackling environmental issues

MILFONT, T. L. (Victoria University of Wellington), BIENIOK, M. (Humboldt University at Berlin)

Environmental issues have long been viewed as posing social dilemmas in which individual and collective interests are at odds. Prior research investigating why people cooperate in environmental social dilemmas has mainly focused on social concerns, showing that people’s identification and/or concern with others can encourage higher levels of cooperation. However, recent research has shown that temporal aspects are also important in environmental social dilemmas. This is because environmental issues entail not only social conflict (individual vs. collective interests) but also temporal conflict (short- vs. long-term interests). In this talk, we will present findings from our research program examining the influence of people’s psychological time on their attitudes and behaviors toward the environment. In particular, data from a survey questionnaire administered to general and student populations from Germany and New Zealand will be discussed. This study investigated the influence of five time perspective dimensions (Past-Negative, Past-Positive, Present-Fatalistic, Present-Hedonistic and Future) on environmental attitudes and self-reported ecological behaviors. The Germany sample was composed of 299 participants (77% female; mean age = 27 years, SD = 7.6), and the New Zealand sample of 322 participants (70% female; mean age = 19 years, SD = 2.6). Participants completed the Zimbardo Time Perspective Inventory, the Environmental Attitudes Inventory, and an 8-item self-reported ecological behavior scale. Consistent findings emerged across countries. Results from hierarchical regression analyses showed that Present-Hedonistic and Future positively predicted ecological behavior, while Present-Hedonistic also positively predicted environmental attitudes. In line with previous studies, future-oriented individuals (those who are concerned about the future consequences of their actions) seem to act more to address environmental issues. Surprisingly, present-hedonistic individuals (those who are oriented towards present pleasure) also seem to be environmentally inclined. Hedonistic people seek stimulating and novel information, and tend to have a liberal outlet in life, which might explain the link between hedonism and environmental protection. Tackling environmental problems requires understanding of the psychological factors that motivate people to show concern for, and take action on, environmental issues. Our research shows that psychological time influences behaviors and plays an important role in people's assessment of environmental risks.

Keywords: environmental social dilemmas, social conflict, temporal conflict, future orientation, present-hedonistic individuals
Psychological needs of caregivers

Chair(s): GOODHEART, C. D. (American Psychological Association)

An increasing number of people around the world are caring for loved ones who are aging or living with chronic diseases or disabilities across the lifespan. Caregiving is a mental health risk factor that significantly affects the work of psychologists. This symposium offers a cross section of presentations that address the needs of a broad group of family caregivers. These include discussions of a new online resource: the APA Family Caregivers Briefcase for Psychologists, the emotional costs for professionals who work with very ill children, Australian initiatives for caregivers of people with dementia, and the role of cultural values in shaping responses to caregiving stress.

The 2010 American Psychological Association presidential initiative on caregivers

GOODHEART, C. D. (American Psychological Association)

Caregiving is a mental health risk factor that significantly affects the work of psychologists. Almost everyone becomes a caregiver at some point in her/his life. It is a family issue, a life span issue, a public health issue, a socio-cultural issue, a health disparities issue, and an international issue. This presentation discusses the development of the APA Family Caregivers Briefcase for Psychologists, a web-based compendium of resources for psychologists and allied professionals that includes awareness, roles, resources, and opportunities. It is designed to assist psychologists in assessing and addressing the needs of a broad group of family caregivers.

Keywords: caregivers, briefcase, resources

Psychotherapy for children with life-threatening illness: The high cost of helping

KOOCHER, G. P (Simmons College)

The psychotherapeutic care of children and adolescents confronting life-threatening illness can afford practitioners an opportunity to make a very positive difference for families at a critical and highly vulnerable moment in their lives. At the same time, such valuable work comes at a high emotional cost with accompanying burnout hazards to practitioners who venture into this work. This presentation will discuss the value of the work and strategies for maintaining practitioner resilience.

Keywords: practitioner resilience, children, life-threatening illness

Innovative strategies in Australia targeting caregivers of persons with dementia

PACHANA, N. A. (The University of Queensland)

The Australian context presents challenges to delivering psychological assistance to persons with dementia and those who care for them. Examples of three innovative programs aimed at improving caregiver mental health are discussed: 1) the commonwealth-sponsored service, Dementia Behaviour Management Advisory Service, which offers assistance to home carers as well as residential aged care facilities in understanding and better responding to behaviours of concern in persons with dementia; 2) a postal based psychosocial support project targeting regional and rural caregivers; 3) several projects facilitating placement of clinical psychology trainees in residential aged care settings. All of these projects address two important issues in the Australian context, namely restricted psychological services in regional and rural areas, as well as restricted access to psychological services by those living in residential aged care facilities.

Keywords: caregivers, dementia, regional, rural
Cultural values as an influence on stress and coping among family caregivers of persons with dementia

KNIGHT, G. (University of Southern California)

Drawing on research with US ethnic populations as well as studies with caregivers in Spain, Korea, and Japan, the role of cultural values in shaping responses to caregiving stress is explored. The updated sociocultural stress and coping model suggests a common core model that links behavior problems to appraisals of burden to physical and mental health outcomes. The role of cultural values examined to date has been mediated more through coping styles and social support rather than through appraisals of burden as first expected. Future directions for research in this area include a greater focus on group specific cultural values and more attention to measurement issues across cultural groups.

Keywords: caregivers, burden, mental health

Psychological perspectives on men's health

Chair(s): WALKER, G. (Monash University)

A growing body of research has provided strong evidence that men have less healthy lifestyles than women. The search for explanations as to why men are more likely to adopt unhealthy beliefs and behaviours has led researchers to examine men’s views about being a man. Pleck (1981) introduced the gender role strain paradigm, which has resulted in the development of a number of measures for examining men’s gender role beliefs. The first paper examines the extent to which relationship satisfaction for men relates to conformity to traditional male norms. Furthermore the study also considers the context of men’s lives by examining the impact of social support on these variables. The second paper is concerned with factors that influence the likelihood of men seeking help in response to health problems and examines role of masculine norms and general self-efficacy. The third paper also looks at the way that context may impact on help seeking behaviour for mental health issues with a comparison of Australian and Egyptian men on their conformity to traditional male norms and their perception of stigma. The final paper examines men’s help seeking in relation to depression in the context of a qualitative investigation of men’s experience of depression.

Masculinity, perceived social support and relationship satisfaction

TOOP, F. (Monash University)

To explore the association between conformity to masculine norms and relationship satisfaction in a sample of married or de-facto men and women raising children. Additionally the study sought to examine whether an association between masculine norm conformity and relationship satisfaction was mediated by differing sources of perceived social support; a significant other, family or friend. Participants were 49 females and 58
males who were recruited via word of mouth and advertising. Participants were asked to complete four questionnaires, a demographic questionnaire, the Relationship Assessment Scale (RAS), Multidimensional Scale of Perceived Social Support (MSPSS) and the Conformity to Masculine Norms Inventory (CMNI). A modified version of the Conformity to Masculine Norms Inventory was used in order to evaluate women’s perception of their male partner’s conformity to traditional masculine norms. Pearson’s product moment correlation co-efficients were calculated to explore the associations between men and women’s RAS and CMNI total and sub-scale scores. A significant negative association was found between both men and women’s total CMNI and RAS scores. In addition the subscales of men’s Risk Taking, Emotional Control, Self-Reliance, Primacy of Work and Playboy were all significantly negatively correlated with men’s RAS. In contrast, women’s CMNI subscale scores, Winning, Violence, Power over Women, Dominance, Playboy, Self-Reliance and Primacy of Work yielded significant, negative correlations with women’s RAS. Mediation analyses were used to investigate the influence of perceived social support on the relationship between CMNI and RAS. Perceived social support from family fully mediated the effect of conformity to masculine norms on relationship satisfaction for men. Social support from a significant other fully mediated women’s perception of their partner’s conformity to masculine norms and relationship satisfaction. The study addressed the call for greater research into the different contexts in which varied masculine gender beliefs operate, and the potential influence of third variables on masculinity and psychological outcomes. Results reaffirmed the argument that adherence to traditional masculine ideologies is associated with decreased relationship satisfaction for both men and women. The significance of specific traditional norms were shown to vary for the present sample of cohabiting men and women involved in parenting, as compared to previous samples of dating college-aged students. The finding that perceived social support acted as a mediator suggests that greater conformance to traditional masculinity may reduce one’s perception of available social support, that is, in turn, related to decreases in relationship satisfaction; subsequently, highlighting the valuable role potential third variables can play in the complex relationship between masculinity and relationship satisfaction. Consequently, clinical interventions which address social support could potentially assist in reducing potential negative effects of conformance to traditional male ideologies.

Keywords: conformity, masculine norms, relationship satisfaction, social support, risk taking

Predicting barriers to men's health-care utilization: The role of masculine norms and general self-efficacy

BOMAN, E. (Monash University)

The study explored the relationship between Australian men’s masculinity, general self-efficacy (GSE) and perceived barriers to health-care utilization. Possible relationships between these constructs could provide further evidence for how men’s health-care utilization relates to the social construction of masculinity. Additionally, by assessing the relationship that general self-efficacy has with masculinity and barriers to health-care utilization, this study aimed to explore further ways by which the variation in men’s health-care related help seeking can be explained. The participants were 118 men (M = 23.7 years, SD = 6.18 years), most of whom were Australian undergraduate university students who completed on-line measures of the constructs. The measures used were (i) The Conformity to Masculine Norms Inventory (CNMI.) The CNMI (Mahalik et al., 2003) administered to measure the extent to which participants conformed to masculine norms (ii) The Barriers to Help-seeking Scale (BHSS) (Mansfield, Addis & Courtenay, 2005) used as a measure of the barriers that men might perceive to utilizing health-care (iii) The General Self-efficacy Scale (GSE) (Schwarzer & Jerulsalem, 1995) designed to tap into a person’s beliefs about the capacity to deal effectively with a broad range of daily hassles and stressful life events. As hypothesized, masculinity was positively related to barrier perception and to GSE, and GSE was negatively related to barrier perception. As hypothesized, masculinity and GSE were significant predictors of perceived
The hypothesis that GSE would moderate the relationship between masculinity and perceived barriers was partially supported with significance found under conditions of low general self-efficacy. This study revealed that men’s reports of masculine norm conformity and general self-efficacy were related to their perceptions of barriers to health-care utilization. These relationships varied depending on the barrier being assessed, which emphasized the importance of contextualizing men’s help-seeking behavior. The additional finding that general self-efficacy partially moderated this relationship highlighted the usefulness of this construct for explaining variability amongst men. It also underscored the possibility that the understanding of men’s health-care utilization may be benefited through integration with existing health behavior models and constructs.

**Keywords:** men, masculinity, general self-efficacy, health-care utilization, help-seeking

The cultural context of men’s help-seeking behaviour: The importance of male role socialization and social stigma.

**HANNA, A. (Monash University)**

The study explored the relationship between men’s conformity to masculine norms, levels of perceived social stigma and help-seeking attitudes and behaviours in Egyptian and Australian men. The participants included 121 men aged between 21 and 35 (M = 27.02 years, SD = 3.91), composed of 61 Australian (M = 26.5 years, SD = 3.66) and 60 Egyptian men (M = 27.6 years, SD = 4.1), who completed the online self-report measures of the constructs. As hypothesized, it was found that men’s conformity to masculine norms and experiences of self-stigma, were negatively related to their attitudes towards professional psychological help-seeking. Egyptian men demonstrated a greater endorsement of masculine norms and exhibited higher levels of self-stigma than Australian men. Furthermore, it was found that Egyptian men held more negative attitudes towards professional help-seeking than Australian men. Finally, the study explored the help-seeking behaviours and masculinity ideologies of Egyptian and Australian men and noted several significant differences between cultural groups. The study has revealed that men’s conformity to masculine norms and social stigma is related to negative help-seeking attitudes and behaviours. However, this relationship was not found within the Egyptian-Australian migrant population and suggests that other factors may be more salient in this particular culture. Both conformity to masculine norms and levels of perceived stigma were found to vary between Egyptian and Australian men highlighting the importance of investigating these constructs within culturally specific settings. Furthermore, differences were also found between groups, in the forms of help previously sought and in anticipated help-seeking behaviour. The finding that Egyptian men will predominately rely solely on advice from family and religious services for mental health concerns, underscores the mental health risk of men from this culture who are reluctant to seek appropriate psychological assistance to deal with their issues.

**Keywords:** conformity, masculine norms, social stigma, help-seeking, cultural diversity

“Nobody understands”: A qualitative analysis of men’s experience of depression and barriers to seeking help

**WALKER, G. (Monash University)**

This study uses a grounded theory qualitative design to consider the role of male gender stereotypes in men’s reluctance to seek help, what encourages or discourages men from seeking help and the effect of social networks on the support they seek. The sample consisted of eight males who agreed to be interviewed about their depression. The study was previously advertised at a men’s health forum presented by the cities of Casey/Cardinia, which had an attendance of around 250 people. The participants responded to a call for male volunteers between the ages of 18-85 who had suffered depression. The men then participated in semi-structured interviews ranging from 1-2 hours. Topics for the interview were generated from a review of the literature on men’s depression and help-seeking. Key topics included reactions
to the term ‘depression’, causes for depression, initial signs, symptoms, masking or hiding depression, help-seeking and level of need reached before seeking help. Participants generally adhered to a stereotypical male gender role by avoiding signs of weakness and vulnerability and trying to stay in control. This initially made it more difficult for them to recognise depressive symptoms and then made it more difficult for them to seek help. The study also found that a number of the men sought help when encouraged to do so by those around them. Seeking help was initially perceived to be a negative thing by most men as they struggled to believe that anyone would understand what they were experiencing and if they did understand, they believed no one could really help. Many couldn’t see the point in seeking help and for others there was still the stigma attached to depression that prevented them from reaching out. Given that general practitioners and intimate partners are considered influential in men’s help seeking behaviours, it is suggested that they be targeted more in campaigns encouraging men to seek help (Mahalik & Rochlen, 2006). Studies have also indicated that increasing education about misconceptions related to depression may decrease stigma attached to it and promote help seeking amongst men (Wang, Fick, Adair, & Lai, 2007). This could be done through different community-based programs or even websites that preserve some sense of anonymity.

Keywords: male gender stereotypes, help-seeking, depression, stigma, community-based programs

Psychological research and practice with women – problem or solution?

Chair(s): GRIDLEY, H. (Australian Psychological Society)

This symposium will critically examine ways in which psychological theory, research and practice with women can be conceptualized as ‘part of the problem’ or ‘part of the solution’ in promoting gender equity and socially just outcomes for women. Guiding questions and related learning objectives across the three papers include: (1) How are our commitments to feminist values evident in our research and practice? (2) How do we enact gender equity in our work as researchers, practitioners and educators? (3) What psychological initiatives or achievements in gender justice are worth celebrating and sharing? (4) How can the pedagogy of psychology be better directed in ways that ensure future generations can contribute towards improving the lives of women? The first paper raises questions about the tendency for gambling research to over-emphasise gender differences based on stereotypical preferences and behaviours, and presents some research findings that confound such unhelpful assumptions. The second paper focuses on gaps in psychological training and practice that may impede the accurate and timely identification of domestic violence as a presenting problem, and examines a recently developed assessment framework designed to be used by general health workers, community service workers and counselors. The third paper provides an antidote to much of the research and practice literature that problematises and pathologises the lives of lesbian women. The author presents research analysing aspects of the family life of lesbian women in Australia, and considers how their psychological health and well-being can be promoted and their resistance to the effects of discrimination supported in public policy as well as health service provision.
Gender differences in gambling behaviour: Do the pokies offer a bankrupt equality between the sexes?

DUNN, C (James Cook University), CALTABIANO, N. (James Cook University)

Over the past decade the focus on gender ‘differences’ has received considerable attention in the gambling research literature. Stereo-typical differences are invariably cited, with males predominantly preferring games of skill or multiple activities (racing, sports betting and casino) and females displaying preference for singular, passive games of chance (pokies and lotto). Recent evidence suggests that regular (at-risk) poker machine players display minimal gender differences. Furthermore, these findings suggest that the variation in motivations to gamble, individually, far outweigh gender differences, generally. This study presents a number of motivational profiles and quantitative results of problem gamblers who took part in a larger study. Issues such as feminist approaches to problem gambling treatment, motivational enhancement and the resistance to gender stereotypes by women who initially gain empowerment from gambling are discussed. While gender stereotypes are evident in occasional gamblers and in ‘pathological’ gamblers, there appear to be more similarities than differences in regular (at-risk) poker machine gamblers. This may highlight both the highly repetitive, practised nature of the activity, and also the role of socialisation in a highly conducive, safe and female-friendly environment of gaming venues. While there is a well established tendency for males to over estimate their skill, and females to be strongly influenced by negative appraisals, it is argued that both genders display the same unrealistic beliefs about winning.

Keywords: gender differences, gambling, gender stereotypes, motivational enhancement

Who knows? Practitioner skills, ethics and domestic violence

O’BRIEN, C. (Doncare)

Over the last 10-15 years, the social, political and legal response to domestic violence has changed in many western countries. It is now widely recognized in government policy as a gendered crime, and the legal definitions now include psychological, social and financial as well as physical abuse. At the same time, surveys continue to reveal that community attitudes are lagging behind this understanding. With little reference to domestic violence in many training courses, it is understandable that medical, legal and psychological/counselling professionals may also have outdated views on this issue, or be practising without a best practice understanding of the dynamics involved or the interventions that are best suited to this presentation. What do we know about this likely gap in expertise, what harm may it be causing and how can we close the gap among psychologists and related professionals? A brief overview will examine research on the capacity of mental health and related professionals to identify and assess presentations where domestic violence is suspected or reported. The paper will then consider the recently developed assessment framework and tools being used by Victoria Police and the specialist Domestic Violence sector in Victoria, Australia. There is evidence that medical and mental health professionals have low rates of correctly identifying the incidence of domestic violence among their clients. In part, these findings can be attributed to lack of training and understanding; they may also be related to persistent unhelpful community attitudes. This paper will critically articulate the issues that arise when domestic violence is not correctly identified, and offer some training guidelines and assessment tools now available for assisting health professionals in this work.

Keywords: domestic violence, assessment tools, Victoria Police, training guidelines
“It’s just everyday”: Resources and strategies, including non-discriminatory family-related legislation and public policy, that promote the health and well-being of lesbian mothers and their children

SHORT, E. (Victoria University)

Although the heterosexism and discrimination encountered by lesbian women who are mothers can have negative practical, financial, social and psychological consequences, lesbian mothers and their families frequently thrive. The aim of this research was to analyse aspects of the family life of lesbian women in Australia, including how the varying legal, public policy, social and discursive contexts (including the recent legal changes to recognise both women in a female couple as parents of children conceived via assisted reproduction) affect and shape family life and well-being, and how psychological health and well-being can be promoted. In-depth semi-structured interviews were undertaken with 68 participants from three States and Territories of Australia (56 lesbian mothers or intending mothers and 12 service providers or community organisers). The data were analysed using a contemporary grounded theory approach, and contextualised with analysis of legal, public policy and other documents. Various resources and strategies can build or maintain resilience and well-being and assist lesbian women and their families to navigate and resist both structural and ‘mundane’ heterosexism and discrimination. A range of the legal, social, emotional, and knowledge-based resources and strategies which promote the well-being of lesbian women and their families is presented, including the very significant recent legislative amendments in Australia to recognise the family relationships of parents and children in the families of lesbian women. It is important to promote knowledge of these resources and strategies, including the importance of non-discriminatory laws and policies, to health and other service providers, public policy makers, and legislators. Knowledge about how lesbian women and their families can maintain resilience and well-being in the context of heterosexism and discrimination can also potentially be of benefit to other people who experience various types of discrimination and stigma, and for those who work with such people.

Keywords: lesbian women, lesbian mothers, public policy, legislative amendments, discrimination

When caring is bad for your health: Depressed women identify key factors to guide their recovery from depression

VIDLER, H. (University of Western Sydney)

We know that the pathways into and out of depression vary for every individual and involve a combination of physical, intrapsychic, interpersonal, social and contextual factors. The work with depressed individuals is slow and complex. Identifying common factors can support this work and produce meaningful and lasting results. Building on earlier research that used in-depth interviews to ask women about their experience of being depressed and also of recovery, the SHIFT-Depression tool has been developed to aid treatment planning. Women over 18 years, self-assessed as sad or depressed, were recruited via newspaper and radio. Women completed an online survey that included the Centre for Epidemiological Studies Depression Scale (CESD) and the Self Help Inventory For guiding Treatment of Depression (SHIFT-D). From 223 completed responses and using a cut point of 16 with the CESD provided a sample \[N = 206, \text{Mean CESD score} (33.98) \pm (8.16)\]. Findings on the SHIFT-D, Part A ‘Things connected to my sadness or depression’ and Part B ‘Things that may help alleviate my sadness or depression’ showed a strong correlation with issues concerning neglect of self-care, prioritizing care of others, lack of supportive relationships with reciprocal caring, not feeling valued, feeling responsible for everyone else, feeling pressured to be how others wanted, no time for self, experiencing criticism from others, dealing with current or past abuse/neglect, and feeling stuck. These factors point to how these women interacted in relationship with others who depleted them. If women, particularly mothers, follow socially prescribed gender roles encouraging women to self-sacrifice and put self last, patterns of expectations are set up in relationships that are hard to change and
can leave women vulnerable to depression. These results suggest, that in our work with women, we enquire about appropriately balanced self-care/other-care, and whether women need help learning to set boundaries and limits with others, encouragement to be assertive, and support to identify and seek relationships with reciprocal caring where they will be respected and valued.

Keywords: depression, women, caring, recovery

**Psychological type - it's worth another look: Evidence from different settings**

Chair(s): BALL, I. (Deakin University)

Discussant(s): GEYER, P. (University of South Australia)

There are several reasons why psychological type is worth another look. In recent years there have been serious efforts to strengthen the measuring process resulting in increased reliability and construct validity. Reliability generalization has been convincingly demonstrated, with strong internal consistency and test-retest reliability estimates. Recent forms of both main instruments (Myers Briggs Type Indicator and Psychological Type Inventory) now feature item response theory yielding four factors as distinct, well defined constructs: extraversion—introversion (E-I), sensing—intuition (S-N), thinking—feeling (T-F), and judging—perceiving (J-P). Additionally there have been advances made in type theory, for example, identification of interaction styles, the linking of type with archetypes, as well as the exploration of five facets for each of the four preferences, which add significantly to face validity for end users as well as increased opportunities to recognize differences in the expression of type. There has been research which indicates that although type explanations and trait explanations share some common variance, they are best regarded as different conceptions of individual functioning, serving different purposes. There is now wide evidence that type concepts have universality across cultures and between national groups, but with the caveat that the expression of type may differ due to cultural influences. Psychological type instruments are probably best construed as tools for personal and organizational development, and this is reflected in training opportunities where more regard is now being paid to the application of type concepts for a wider range of clients. This symposium explores the application of psychological type concepts in four different settings: business, education, community and
government organizations. These studies indicate the usefulness of psychological type concepts across a range of settings. The presenters will report on research conducted in Australia and New Zealand. The three key learning objectives are: (1) To demonstrate how psychological type concepts can lead to a greater depth of understanding of individual differences (2) To facilitate the process by which participants can increase their knowledge of the applicability of type concepts in a variety of settings and purposes (3) To explore connections between ideas that have practical relevance for practitioners.

Incorporating psychological type into leadership development in a professional services environment

WHITE, S. (Peoplechange)

The intent of this paper is to study the effect of the introduction of psychological type through leadership development programmes in an organization that had previously provided only technical education as core curriculum. It was assumed that the natural skepticism inherent in their daily work might lead the participants and organizational leaders to be dismissive of opportunities to apply psychological type knowledge to their job. The sample for this study was five cohorts (N = 114) of managers nominated for in-house leadership programmes within a major professional services firm from 1996-98. The MBTI® was chosen by senior management as the tool for self-knowledge. The first module of seven focused fully on type theory and applications. Action learning was employed in each of the modules which were conducted over a 12-15 month period for each cohort. This approach reflected the desire for the small groups to take on organizational issues that they believed needed a solution and to work proactively over the course of the programme. Senior managers provided very public support for the need for participants to develop greater self knowledge and this set the agenda for the incorporation of psychological type concepts. The writer was employed as the programme learning adviser for the five cohorts. It was found that the five highest frequency types represented 70% of participants. These were ISTJ, ESTJ, INTJ, ISTP and ENTJ. Senior managers showed more introversion preferences compared to junior managers. Case studies of two business units within the firm will be reported where psychological type knowledge and concepts from the leadership programmes resulted in developments in the methodology of technical work, and successful management of change. Particular outcomes relating to the issues of stress management, team analysis and communication styles will be reported. These outcomes demonstrated the positive effects of the incorporation of the psychological type knowledge within the units. Ten years later psychological type is still used in the learning curriculum of this organization and confirms the acceptance of self-knowledge through a psychological type instrument and the use of that knowledge on the job in daily interactions with staff and clients.

Keywords: psychological type, leadership, stress management

Interaction styles and multiple intelligences: are there relationships?

PERRY, C. (Deakin University)

The intent of this study was to see what differentiation may exist between the four Interaction Styles as detailed by Linda Berens (2001) and the seven intelligences as first specified by Howard Gardner (1983). The use of the term talents or skills by both Berens and Gardner suggests that there may be some overlap of their concepts. The sample of the current study consisted of the entire cohort of the third year of a teacher education degree course at a University in metropolitan Melbourne, Australia (N = 336). In their studies of Individual Differences, these beginning teachers completed the Myers-Briggs Type Indicator (MBTI) and the Multiple Intelligence Checklist for Adults (MICA). The students agreed to donate their results to the study. The four Interaction Styles were identified from the MBTI: In-Charge, Behind-the-Scenes, Chart-the-Course, and Get-Things-Going. Variations in MICA scores within-subjects were examined by MANOVA with the Interaction Styles as the between-subjects variable. Distinct patterns of the Interactions Styles showed different relationships for four
of the seven intelligences: Musical, Logical-Mathematical, Bodily-Kinesthetic, and Interpersonal. These significantly different results add to the value of including both concepts in the descriptions of individual differences. The data confirm that the concepts of Interaction Styles and Multiple Intelligences are distinctive. The evidence from this study indicates that those with particular Interaction Styles do in fact show systematic differences in the use of the range of multiple intelligences. The evidence supports the idea that these two constructs, i.e. Interaction Styles and Multiple Intelligences, do not overlap, but manifest different patterns of usage of the intelligences across the interaction styles. The indications are that for different types of teachers favouring the use of a particular interaction style, there seem to be variations and differences in the patterns of use of the intelligences.

Keywords: interaction styles, multiple intelligences, Individual differences, Multiple Intelligence Checklist for Adults, Myers-Briggs Type Indicator

Organisational culture: Pressure to conform or opportunity for personal growth?

BATHURST, J. (The Open Polytechnic of New Zealand)

The aim of this study was to examine the culture of the Salvation Army and its effects on its Officers. If the culture of The Salvation Army pressures its Officers to conform, it would be expected that best fit preferences and the preferences of those attending more than once would drift towards the observed organizational preferences for E, S, F and J (representing an outgoing, rule based caring organization). If the culture is supportive of personal development, the best fit and repeat preferences would drift towards an individual's true preferences. Salvation Army Officers in New Zealand are expected to take part in MBTI workshops in order to understand themselves, their congregations and clients. This provides an extensive data set for analysis. In total, 971 Officers have taken part in these workshops over 18 years. For 59% of the Officers, both reported and best fit preferences are available. Also, 43 Officers took part in the workshops twice and their data allows for some test-retest comparisons. Three Officers took part three times providing additional checks. Results from this study show that the "average" preferences for Salvation Army females are I, S, F and J, while those for males are I, S and J with T and F preferences being evenly distributed. The best fit preferences show an agreement of 81% with reported preferences. The patterns of changes show 60 changes towards the modal preferences and 75 away from them. This tends to confirm that the organization is not exerting pressure for Officers to have particular type preferences. Closer examination of the test-retest data raises some interesting questions about reliability of preferences over time. Some have changes to three or even all four preferences over five or six years. There is no evidence that the tendencies are towards the modal or organizational preferences. Results tend to show that the culture of The Salvation Army is supporting the personal development of its Officers rather than requiring them to conform to any

Keywords: Salvation Army, Personal development, Group expectations, Organizational preferences, Culture

Seeing is believing: affirmation of psychological type differences through observation in workshop activities

KERR, P. (Queensland Government)

C. G. Jung arrived at his theory of psychological types empirically, by observation of people over two decades. Some critics, however, dismiss the ‘typical differences’ described by Jung as manifestations of the ‘type fallacy’ or the ‘Barnum effect’. The aim of this study was to confirm that the type differences described by Jung are distinct, demonstrable, and consistent with the defining features described by the developers of the Myers-Briggs Type Indicator (MBTI). A group of government agencies collaborate each year to recruit graduates in a professional field. The recruits undertake an induction program, including an introductory workshop on the Myers-Briggs Type Indicator (an application of Jung’s theory). For most, that is their first exposure to psychological type concepts. Participants
provisionally self-select their ‘preferences’ on each of the MBTI dichotomies (extraversion—introversion, sensing—intuition, thinking—feeling, judging—perceiving), guided by descriptions of each dichotomy and their MBTI scores. They then split into ‘type alike’ subgroups for each dichotomy in succession to undertake role-plays designed to illustrate the differences on each dichotomy. Across two annual cohorts of graduate recruits (n = 79), textual analysis of the written outputs generated by the ‘type-alike’ subgroups (split between each of the four MBTI dichotomies) tended to confirm that the word choices and styles of expression manifested by each of the subgroups was consistent with the language and behaviour patterns characteristic of the polar preferences on each dichotomy, as described in the MBTI manual and associated reference materials. This analysis is supported by the distinctive group behaviours observed during the workshop activities. This study offers empirical evidence that individuals who self-identify with one or the other of each of the dichotomous type preferences described in Myers’s and Briggs’s adaptation of Jung’s theory do, in fact, demonstrate language and behaviour consistent with that predicted by, and described in, the MBTI literature.

Keywords: psychological types, Myers-Briggs Type Indicator, Jung, group behaviour, textual analysis

### Psychologists working with substance use: What are the challenges and do we have the training?

Chair(s): MAGOR-BLATCH, L. (University of Canberra)

This symposium considers the growing area of concern for psychologists in working with clients with substance use. Once considered to be the domain of specialist services, psychologists in private practice as well as those in specialist services, are being asked to address a range of issues associated with the use and misuse of alcohol and other drugs. This includes both illicit drugs and licit drugs which may be used illicitly, such as prescription drugs. In 2007, nine out of every ten (89.9%) Australians had consumed a full serve of alcohol in their lifetime. Marijuana/cannabis had been used at least once by one-third of Australians aged 14 years or older and over one-third of the population of Australians aged 14 years or older had used an illicit drug. Pain killers had been used for non-medical purposes by 4.4% and tranquillisers by 3.3%. By comparison, just 1.6% of Australians had used heroin at some point in their lives. While some substance users will require the support of specialist alcohol and other drug (AOD) services, (e.g., detoxification, outpatient counselling, residential rehabilitation), many will present to private practice through referral from General Practitioners, often without acknowledging that they have a substance use problem. The symposium will firstly pose the issue of training for psychologists – do we have the training to prepare us for this work, and if not, what needs to be done in order to equip psychologists to undertake counselling in this area? We will then look at specific examples of work areas of concern to psychologists. This includes: the misuse of pharmaceutical drugs and the implications for psychologists in recognizing and working with people who are dependent on prescription medications; working with AOD users in a correctional setting; and the challenges in working with families – stepping
outside the counselling room into outreach work. This will also throw up the issue of, “who is my client?” The learning outcomes for attendees of this symposium are that they will develop: an understanding of the challenges and rewards of working in the AOD field; an understanding of the training needs required to work with substance-using clients; knowledge of the work being undertaken in the field in a variety of settings and jurisdictions (Western Australia, Victoria and Queensland); and some knowledge of the research currently being undertaken in working with AOD populations.

Alcohol and other drug use and psychological practice: Seeing the wood and the trees

RYDER, D. (Edith Cowan University)

To highlight the lack of appropriate education and training in alcohol and other drug issues provided by postgraduate university courses in psychology and discuss reasons why this should be improved. The paper will review training in alcohol and other drug issues in postgraduate psychology courses and key developments in the alcohol and other drug field. The major reasons why such training needs to be central in psychology training will be highlighted. The major points supporting the argument for an increased emphasis on alcohol and other drug issues are: (1) Most clients of mental health services, a major area of employment of psychologists, experience comorbid alcohol and/or other drug use disorders. The reverse is also the case, with the majority of clients of alcohol and other drug use agencies experiencing mental health disorders. In most instances, alcohol and other drug use is not addressed in mental health services and where it is addressed, referral to another agency is the likely outcome. The same applies in alcohol and other drug services, where mental health issues are not addressed. This, it is argued, is inconsistent with the best interests of the client. (2) The core skills required for addressing alcohol and other drug issues are little different to those required for addressing mental health issues. Psychologists who have good counseling skills and an understanding of cognitive –behavioural approaches can, with appropriate education, readily adapt their skills and the fact that alcohol and other drug issues are not addressed as a matter of routine practice is seen as a question of confidence rather than competence. There are many developments in the alcohol and other drug field that can enhance psychological practice more broadly. Two of these – motivational interviewing and harm reduction – will be briefly discussed. To provide the best possible care for clients, psychologists need to address alcohol and other drug issues as routine practice. To enable them to do this, tertiary training courses should include this as part of the curriculum and this should be included as a requirement for accreditation of these courses.

Keywords: mental disorders, training, alcohol, drug use, postgraduate psychology courses

The rise of pharmaceutical opioids as drugs of misuse – ‘hillbilly’ heroin has come to town

LOVEDAY, B. (Queensland Health)

The misuse of pharmaceutical opioids in Queensland population has significantly increased over the last five years mirroring trends in the USA. Historically, opioid drug misuse has mainly been confined to illicit injecting heroin use. However, the widespread prescribing of pharmaceutical opioids exposes a greater population to possible opioid misuse and dependence. Many of this population might not have had any connection with the illicit drug using milieu. The aim of this discussion is to outline the converging evidence that suggests there might an emerging drug misusing population and discuss the similarities and differences this population with illicit opioid drug misusers and the possible challenges to treatment providers in this area. Prescribing trends of opioid analgesic drugs (i.e., morphine and oxycodone) from Queensland Health prescription records are analysed for the general population showing the increasing volumes of opioids prescribed per person over the last five years. Also examined are Queensland Health records of patients entering into formal opioid substitution programs, for treatment with methadone & buprenorphine, and who have declared pharmaceutical opioids as their...
primary drug of dependence. Results show that there is a significant population of persons receiving opioid analgesics drugs, above accepted therapeutic doses. Many of these persons exhibit drug seeking behaviour by ‘doctor shopping’ and could be considered dependent. However these drug users are not shown to have been involved in formal opioid treatment programs, nor have illicit drugs use histories. Potentially a new population of drug dependent persons is emerging that will be significantly different to previous opioid misusing populations. This population is dependent on chemically similar substances to illicit heroin and many similar treatment approaches would seem appropriate. However, many of these persons might present challenges to treatment providers as many will have commenced therapies for genuine medical conditions and thus might be more resistant to traditional drug dependence treatments. Implications for further research and treatments are discussed.

Keywords: opioid drug misuse, dependence, illicit drug use, treatment, drug seeking behaviour

Demonstrating the efficacy of an intensive psychotherapy group for drug and alcohol users within an adapted therapeutic community

BEEKEN, S. (Caraniche, Marngoneet Correctional Centre)

Marngoneet is a 304 bed medium security correctional facility located in Lara. The Station Peak neighbourhood is a dedicated drug and alcohol treatment neighbourhood where all therapeutic intervention is provided by Caraniche, a specialist forensic psychology company. The neighbourhood houses 102 men supported by a team of custodial staff and Caraniche clinicians with therapy, community living and work the focus of daily living. This presentation will outline the unique and innovative treatment provided by the 130 hour AOD program and discuss the quantitative and qualitative outcomes seen for the 74 men who have completed the group. Repeated measure T-Tests on psychometric outcomes for the Trauma Symptom Inventory, Psychological Inventory of Criminal thinking Styles, Carlson Psychological Survey, Situational Confidence Questionnaire and the Stages of Change Questionnaire demonstrate changes following inclusion in the 130 hour D&A Program. Qualitative examples of activities undertaken by the men from the 130 hour D&A program demonstrate implementation of skills learned and discussed within the 130 hour program. Post treatment two subscales on the Carlson Psychological Survey; the Anti-social Tendencies and Thought Disturbance have decreased significantly. On the Stages of Change questionnaire, the results show a significant increase of the average score of the action stage, suggesting that prisoners are more likely to actively pursue change with regard to their substance use. Seven of the eight subscales of the Situational Confidence Questionnaire had been significantly improved, suggesting effectiveness in addressing substance use issues and in installing confidence to manage difficult situations without using drugs or alcohol. The TSI data shows significantly decreased average scores on six of the ten clinical subscales. Participants reported feeling less anxious and irritable. They were less likely to avoid painful thoughts and memories, less likely to experience intrusive posttraumatic reactions, and less likely to self harm. The PICTS also identified reduction on a number of subscales indicating a shift in criminal thinking style. The data shows a clear improvement on psychometric measures of ciminogenic and non-criminogenic behaviour. Limitations of the data are acknowledged, most specifically the psychometrics do not capture the effect of the Therapeutic Community, which we readily acknowledge has a supporting impact on the process of change.

Keywords: correctional facility, therapeutic intervention, Caraniche, substance use, therapeutic community

Leaving the counseling room: Family home visiting where parents have alcohol and other drug addictions

GRUENERT, S. (Odyssey House, Victoria)

Most of our training as counseling psychologists prepares us to work with an identified client in a controlled setting. Move away from this setting, and the skills and
expertise of other professions such as social workers, becomes a useful addition to the psychologist’s toolkit. This presentation aims to outline the type of work conducted with children and their parents in their Melbourne homes, when parents have drug and alcohol addictions, as well as a range of mental health, legal, and other problems. Case examples, children’s voices, and research findings will be used to highlight the context of this work and explain the common strengths and gaps of psychological training. Psychological training prepares us well for the identification and assessment of issues, the emotional containment of clients, and supporting clients to draw upon their internal resources to find solutions to their problems. Where clients have drug and alcohol addictions, parental responsibilities, child protection issues, blurry boundaries, and low internal resources, work becomes complex and good knowledge of other providers and welfare systems is critical. Psychologists who plan to work in outreach roles with this population would be wise to consider placement experience in similar settings with a range of different professionals to sharpen their self care, systems and community services knowledge and skills.

Keywords: psychological training, counselling psychologists, assessment, drug addictions, alcohol addictions

---

**Psychology and communities:**

**Expanding psychology’s roles, influence, and value**

Chair(s): KELLEY, J. (American Psychological Association)

Social marketing has long been seen by American public health organizations and the United States federal government as the best approach to encourage behavior change and promote disease prevention. For more than a decade, the American Psychological Association (APA) has invested in social marketing initiatives and strategic partnerships to inform Americans about the value of psychological services and the role of psychologists in treating mental health disorders and the behavioral and emotional components of acute and chronic physical disorders, as well as psychology’s role in disease prevention and health promotion. Over the years, APA has confronted stigma in America and encouraged individuals with psychological problems to seek help. Today, through multifaceted social marketing campaigns, APA is promoting the mind-body connection and the development of psychologically healthy workplaces. These efforts are designed to help the public understand the central role psychologists play in disease prevention and health promotion as well as their skills in addressing an individual’s behavioral and emotional issues. This is a particularly important message as people in America debate the future of health care in the United States and the role psychologists should assume in treating health problems, such as diabetes, obesity and chronic pain. This symposium will address the following components of APA’s social marketing efforts: grassroots outreach, the media campaign, outreach to the employer community, outreach to stakeholders, and the building of strategic alliances. Learning Objectives include: 1) Provide Psychologists with effective strategies used by APA for community outreach and collaboration with other community based organizations; 2) Provide Psychologists with effective media strategies to reach the public; 3) Provide
Psychologists with strategies their organization can use to partner with the business community to improve employee psychological well-being and organizational performance; 4) Provide Psychologists with strategies to develop important partnerships with outside groups, through which a disease prevention, health promotion agenda can be furthered.

**Reaching Americans through the media**

KELLEY, J. (American Psychological Association)

The Public Education Campaign of APA has been focusing on the connection between mind and body health. The increase in obesity, heart disease, and stress in today’s society has been linked to one’s psychological and emotional health. APA’s consumer research has demonstrated that Americans are increasingly aware of the connection between behavior and health, that they are recognizing the role that behavior plays in managing stress and contributing to the course of chronic illness, and that they understand the influence and value of psychological health on overall mind/body health and disease prevention. This presentation will focus on two national “Stress in America” surveys that were conducted in 2008 and 2009. The surveys provided insight on leading sources of stress for Americans, addressed the effects of stress on physical and emotional well-being, and focused on trends in the ways in which Americans attempted to manage their stress. The 2008 “Stress in America” survey garnered media coverage for APA and psychologists valued at over $4.5 million dollars. After only a few days of the release of the survey, it had garnered nearly 800 news stories and media coverage. In just the first few days of the release of the 2009 survey, it had reached nearly 28 million people through 850 stories on TV, radio, in newspapers, blogs and news and health Web sites. APA has become a leading resource on stress for the media. The media coverage from these surveys has positioned APA and psychologists as a leading resource on stress for the media.

**Psychologists grassroots outreach**

GOODHEART, C. (American Psychological Association)

In this presentation two effective models for community grassroots outreach will be presented, the mind/body health fair and collaborative efforts with the YMCA. The Practice Organization of APA conceptualized and organized The Mind-Body Health Fair and it was presented in a major United States city. With this pilot and test model, potential challenges were identified and addressed. A “how to” toolkit was developed for the state, provincial and territorial psychological associations (SPTA’s) to utilize and tailor to their own specific needs, based on the geographical location and the population they are attempting to target. This presentation will address how the health fair was developed, and ways it which it can be personalized and modified to meet the specific needs of diverse communities. The YMCA of the USA and APA have combined efforts to work on initiatives to promote health and wellness. This collaboration has been seen by many as a natural fit, since both APA’s Mind/Body Health and the YMCA’s Activate America and Healthy Family Home public education campaigns focus on the important contribution of lifestyle and behavior to physical and mental health. Partnering with the YMCA has provided APA with a unique opportunity to reach a large audience and directly connect psychologists with the public as there are 2,663 YMCAs in America, serving more than 20.2 million people.

**Psychologically healthy workplace program**

KELLY, J. (American Psychological Association)

This component of the presentation will address the development of the Business of Practice Network with emphasis on the formation of the Psychologically Healthy Workplace award program. APA’s Public Education Campaign’s focus on the

**Keywords:** public education campaign, obesity, heart disease, stress, chronic illness
contribution of lifestyle and behavior to stress management reinforces APA's Psychologically Healthy Workplace program messages linking employee well-being to organizational performance and has created an opportunity for a natural partnership between the programs. This campaign helps businesses understand the importance of positive mental health within the business community, and how a psychologically healthy workplace can impact business success. Through the campaign, APA works with its affiliated state, provincial, and territorial psychological associations (SPTAs) to carry out their local Psychologically Healthy Workplace programs. Today, 52 SPTAs have a Psychologically Healthy Workplace Program (PHWP), more than 400 organizations have been recognized locally and 80 organizations have received national recognition from APA, expanding psychology’s marketplace visibility with employers. Between 2007 and 2008, APA and its affiliated SPTAs distributed approximately 54,000 PHWP brochures and more than 26,000 Psychologically Healthy Workplace Awards magazines to employers, the public and the media.

*Keywords: Business of Practice Network, Psychologically Healthy Workplace award program, lifestyle, stress, media*

**Connecting with stakeholders and building strategic alliances for psychology’s future**

KELLY, J. (American Psychological Association)

This presentation will discuss the Future of Psychology Practice Summit that was a major Presidential initiative of the 2009 APA President. A major goal of the Summit was to assemble leaders in the practice of psychology and other professionals who are critical stakeholders to the practice of psychology to address the following objectives: 1) Models and opportunities for future practice to meet the needs of our diverse public; 2) Priorities for psychologists practicing in private and public settings; 3) Resources needed to effectively address the priorities; 3) Roles of various practice groups in implementing the priorities; and 4) Key partnerships to implement the psychological agenda. The Summit was a collaborative effort among different partners of the practice community. APA collaborated with non-psychology groups to incorporate a broader public perspective into our work. It was felt that developing partnerships with these outside groups would be key to implementing psychologists’ practice agenda. A primary outcome of the Summit was the development of a clear agenda for the future of our multi-faceted and diverse practice community.

Psychology, ethics and social justice

Chair(s): PETTIFOR, J. (University of Calgary)
Discussant(s): TASSELL, N. (Massey University)

The main objective of this presentation is to explore the meaning of the concept of social justice as an ethical responsibility of psychologists. The first presentation reviews how the concept of social justice has been understood historically from ancient times to the present, and how health professions have responded. The findings indicate a wide range of activities by psychologists that can be construed as working for a more equal, fair and just society. There is also a wide range and degree of injustice and suffering in the world. In the western world there is a stronger emphasis on individualist values, while in many other countries, the societal and collectivist problems take priority. The role of the clinical supervisor in North America in enhancing the multicultural competence of practitioners is described. One of the greatest injustices of our times is the continuing racism and neglect of Aboriginal/Indigenous peoples resulting from having been conquered and colonized by more powerful nations. Two diverse examples of psychologists responding to such injustice are presented, namely from South Africa, and from Australia and Torres Strait Islanders. The conclusions are that psychologists have, and should have, an ethical responsibility to work for social justice and against practices that violate their ethical principles. There are many ways, both individually and collectively, in which psychologists can work with others in contributing to greater justice and harmony in the world. Despite many dark spots, there is increasing awareness and actions world wide to build a more just society. Psychology has much to contribute.

The history of the concept of social justice in professional ethics

SINCLAIR, C. (Hincks-Dellcrest Centre)

The purpose of this presentation is to trace the history of the development of the concept of social justice from before the time of the Hippocratic Oath to modern times, and to demonstrate that over the centuries the professions have expressed a sense of responsibility to the broader community and a concern for the personal and social wellbeing of all members of society. In researching this topic, various sources were used, including various oaths and codes of ethics over time, as well as historical documents concerning concepts of human rights, equal opportunity and benefit, and attention to the needs of the vulnerable and economically disadvantaged. Historical precedents led to modern-day definitions of social justice. In addition, it will be shown how the suggestion that professions have a responsibility to pursue social justice has occasionally been met with ambivalence if not outright rejection by some professionals. Suggestions will be made regarding the reasons for such ambivalence, and for the apparent current commitment of psychologists to the principle of social justice nationally and internationally.

Keywords: social justice, well-being, human rights, equal opportunities, codes of ethics

Supervision and social justice: A view from North America

FALENDER, C. (UCLA and Pepperdine Universities)

This presentation will explore the concept of social justice as an ethical value in clinical supervision. Various ethics codes and guidelines from the American Psychological Association and the Canadian Psychological Association will be reviewed regarding their attention to responsibility to society and commitment to social justice. Through the use of vignettes and exercises aspects of supervision will be identified that provide added impetus for working for social justice. Various ethics codes and guidelines support the ethical principle of responsibility to society while there continues to be some confusion regarding the concept of social justice. However, the attitudes and values of supervisors, supervisees and practitioners are receiving increased attention along with the encouragement to show empathy for others.
The task of the supervisor is to assist the therapist/supervisee in understanding and using feelings and attitudes toward multiple cultural identities of the client in the context of his/her multiple cultural identities and attitude towards social justice. This entails enhanced self-awareness, with clarity of the impact of self upon the client and upon the supervisory process. Social justice is an implicit ethical value in clinical supervision. Supervisory roles that support ethical practice in the interests of social justice will be clarified.

Keywords: social justice, ethics, empathy, clinical supervision, ethical practice

Narrative ethics in action: A case study from South Africa

GOBODO-MADIKIZELA, P. (University of Cape Town)

This presentation will explore a narrative approach to ethics using as context the role played by Cape Town psychologists in the aftermath of the xenophobic violence that broke out in South African townships in May 2008. The paper examines some of the stories that emerged from psychologists’ work in the safe sites for displaced persons who were forced out of their homes in major South African townships. The focus on narrative as the field of discussion of ethics offers a broader moral framework for reflection on the ethical dilemmas that psychologists encounter in the social and political world. This framework places the experiences of communities, rather than abstract principles, in the centre of professional practice and opens up the possibility for action where psychologists can become social change agents. The presentation will conclude by pointing out the potential challenges that may emerge when there is a blurring of distinction between narratives of psychologists and of the vulnerable groups they serve.

Keywords: ethics, ethical issues, social change agents, violence, narrative approach

Aboriginal psychology organizations for social justice

DUDGEON, P. (Australian Indigenous Psychologists Association)

This paper will explore the philosophy and roles of Indigenous Australian Aboriginal and Torres Strait Islander psychology organizations in the promotion of mental health for Aboriginal people and for societal changes that are fair and just for all citizens. This aim is in recognition of the great injustices in the world of racism and neglect of Indigenous peoples that have been conquered and colonized by more powerful nations. The authors have been deeply involved in Aboriginal social justice issues for many years. With the advantage of their experience they have taken a specific organization as an example of Aboriginal psychologists working for social justice. The members of the organization recognize that colonization has resulted in social, political and psychological disadvantages and suffering. They are committed to change within a framework of Human Rights. They believe that change requires shared partnerships between Indigenous and non-Indigenous colleagues. Reconciliation requires a sharing of power. The goal is a shared country where people work together to bring about social change that will create a better future for all. Strategies are used to bring about equal and harmonious relationships. Good progress is being made as Indigenous people have access to higher education and access to more powerful positions in society. The conclusion is that Aboriginal psychology organizations are effective in bringing about change. Two questions are raised for discussion: How can psychologists contribute to social justice for indigenous peoples? How similar world-wide are the issues for Aboriginal/Indigenous peoples.

Psychometric and taxometric models in epidemiological datasets to inform DSM-V

Chair(s): BAILLIE, A. (Centre for Emotional Health, Psychology Department, Macquarie University)
Discussant(s): HAMBLETON, R. (University of Massachusetts at Amherst)

This symposium presents research concerned with the empirical revaluation of the DSM-IV diagnostic system. Papers within the symposia address whether specific mental disorders are best conceived of as dimensions or categorical classifications, whether specific comorbidities might show as different symptom profiles, and whether specific diagnostic criteria show any bias for important groups in the community. Key Learning Objectives include: Demonstrate psychometric and taxometric techniques for evaluating diagnostic systems; improve symposium participant understanding of Item response theory methods for evaluating item bias; demonstrate new Factor Mixture Models for comparing categorical and dimensional models.

Investigating differential symptom profiles in major depressive episode with and without generalized anxiety disorder

SUNDERLAND, M. (School of Psychiatry, University of New South Wales), MCBRIBE, M. (University of Ulster at Magee Campus), TEESSON, M. (National Drug & Alcohol Research Centre, University of New South Wales), SLADE, T. (National Drug & Alcohol Research Centre, University of New South Wales)

Large community based epidemiological surveys have consistently identified high comorbidity between major depressive episode and generalized anxiety disorder. Some have suggested that this co-morbidity may be, in part, an artefact and the product of the current diagnostic system. Due to the added direct and indirect patient costs associated with co-morbidity it is important to investigate if methods of diagnostic assessment are artificially increasing the level of observed co-morbidity. The current study aims to examine whether symptom similarity between major depressive episode and generalized anxiety disorder is contributing to the observed co-morbidity found in epidemiological studies. The item response theory log-likelihood ratio procedure was used to test for differential item functioning of major depressive episode symptoms between respondents with and without a diagnosis of generalized anxiety disorder in the 2001-2002 National Epidemiological Survey on Alcohol and Related Conditions. The presence of generalized anxiety disorder significantly increased the chances of reporting any symptom of depression with odds ratios ranging from 2.54 to 5.36. However, there was no indication of significant differential item functioning of major depressive episode symptoms in respondents with and without generalized anxiety disorder. The lack of any significant differential item functioning indicates that the reporting of symptoms used to assess major depressive episode are not biased toward respondents with or without generalized anxiety disorder. The findings of the current study do not support the hypothesis that conceptually similar symptoms are partly responsible for the high co-morbidity between major depressive episode and generalized anxiety disorder. Instead, major depressive episode and generalized anxiety disorder may be thought of as two distinct diagnostic entities that commonly co-occur due a shared underlying trait.

“Youthful epidemic” or diagnostic bias? Differential item functioning of DSM-IV cannabis use criteria in an Australian general population survey

MEWTON, L. (National Drug & Alcohol Research Centre, University of New South Wales)

Studies have consistently shown that prevalence rates of cannabis abuse and dependence are higher for younger adults when compared with older adults. It is
necessary to examine the performance of criteria across age groups to establish whether these differences in prevalence rates are a result of diagnostic bias. The current study aims to investigate whether there is any age-related differential item functioning in the DSM-IV diagnostic criteria for cannabis use disorders using an item response theory approach. The sample consisted of 10641 participants in a population-based survey of Australian adults aged 18 years and older. DSM-IV cannabis use disorders were assessed in all 722 respondents who indicated that they had used cannabis more than five times in the previous twelve months. Age-based differential item functioning was assessed in each of the DSM-IV criteria for cannabis use disorders. Age-based differential item functioning was only detected in the Hazard criterion of the DSM-IV cannabis use disorders. The α parameter for the Hazard criterion was more discriminating for those aged 18-24 when compared with those aged 25 and over. The DSM-IV criteria for cannabis use disorders appear to function similarly across age groups. Differential item functioning was only detected in the α parameter for the Hazard criterion. These results are discussed with regard to implications for future editions of the DSM system.

Keywords: cannabis abuse, dependence, DSM-IV diagnostic criteria, performance, diagnostic bias

Measurement Invariance in Social Phobia?

VALPIANI, E. (Centre for Emotional Health, Psychology Department, Macquarie University)

Social phobia, characterized by a fear of negative evaluation or embarrassment, is one of the more prevalent disorders in community samples. It is has an early onset and chronic course, and is associated with negative psychosocial outcomes and co-morbid disorder. Typically, more females report social phobia than males; however, comparisons between males and females is tenuous without establishing measurement invariance of diagnostic measures. Measurement invariance refers to respondents with equal levels of the latent construct (e.g. social phobia) responding in equivalent ways regardless of group membership. Without measurement invariance, responses may be confounded by systematic response biases. This study aimed to establish whether differences in reporting of social phobia between males and females reflected real differences or measurement bias instead. The sample was a subgroup of respondents in a large scale Australian community survey (National Survey of Mental Health and Wellbeing (NSMHWB), 1997) who reported experiencing at least one social fear. Respondents were asked questions assessing DSM-IV diagnostic criteria via the Composite International Diagnostic Interview (v2.1). A series of hierarchical multiple group confirmatory factor analyses were conducted to establish measurement invariance. Logistic regressions were conducted as consistency tests and to further clarify relationships. Conditions for full measurement invariance were not met, which indicated that males and females differed in their responses to diagnostic criteria for social phobia. These discrepancies were primarily due to differences in the reporting of physical anxiety symptoms between males and females. Compared with females, males under-reported their experience of physical anxiety symptoms at low levels of social anxiety, and over-reported physical anxiety symptoms at higher levels of social anxiety. Accommodating these differences resulted in a strong partial invariance model. Males and females differ in their report of physical anxiety symptoms, which are required to meet diagnosis of social phobia on structured diagnostic measures. Whilst the reasons for this difference are unclear, and may include social pressures, differential experience of physical sensation or restricted measurement of anxiety when relying solely on physical symptoms in structured diagnostic tools.

The latent structure of posttraumatic stress disorder: a taxometric analysis

CARRAGHER, N. (National Drug & Alcohol Research Centre, University of New South Wales)
Considerable debate has centred on whether posttraumatic stress disorder (PTSD) is best conceptualized as a distinct clinical entity or the upper end of a stress-response continuum. With the advent of the fifth edition of the Diagnostic and Statistical Manual of Mental Disorders (DSM-V), nosological questions regarding the latent structure of mental disorders have assumed renewed relevance. Taxometrics is a family of mathematical procedures particularly suited to structural research. Extant taxometric studies yield support for a dimensional model of PTSD. However, to the best of our knowledge there are no published taxometric investigations of posttraumatic stress reactions in general population samples. Accordingly, three taxometric procedures (MAXEIG, MAMBAC, L-Mode) were employed to delineate the latent structure of posttraumatic stress reactions in a traumatized subsample of respondents from the Australian National Survey of Mental Health and Wellbeing (n = 2,677). Findings converged on a dimensional model. Reconceptualising PTSD according to a dimensional model provides a more detailed picture of posttraumatic stress symptoms and has important implications for assessment, research, and treatment.

Factor Mixture Models of DSM-IV Alcohol and Cannabis Use Disorder in Australian Community Samples

BAILLIE, A. (Centre for Emotional Health, Psychology Department, Macquarie University)

Substance use disorders in DSMIV have been evaluated as continuous dimensions with confirmatory factor analysis or as categorical constructs with latent class analysis. Recently Factor Mixture Models (FMM) have been developed which allow comparison of fit for dimensional or categorical models and models with a combination of dimensions and categories. In addition to comparing the fit of different latent structures we examined the relationship between existing and putative criteria and the preferred latent constructs. We used FMM in MPlus to compare the fit of continuous, categorical and mixture models in cannabis and alcohol use disorders in the 1997 and 2007 Australian National Surveys of Mental Health and Wellbeing. In both 1997 and 2007 surveys there was no improvement in fit for categorical latent class, nor for mixture models combining continuous and categorical parameters compared to continuous factor models. The results indicated that both alcohol and cannabis problems can be considered as dimensional, with those with the disorder arrayed along a dimension of severity. Two factor models provided the best fit but with a very high correlation between the factors. A single factor model appears to be the most parsimonious account of the data. A dimensional dependence indicator may provide more information than the current categorical indicator. Some criteria appear to reflect a more severe state than was originally intended and could be revised.

Keywords: substance use, DSMIV, categorical constructs, cannabis abuse, alcohol use
Psycho-oncology: Making sense of cancer

Presenter(s): BURNEY, S. (Cabrini Monash Psycho-Oncology Research Unit, Cabrini Health)

In this symposium some recent examples of research that has being conducted in Melbourne will be used to showcase the issues that are faced by psychologists conducting research and providing clinical services in oncology settings. The key learning objectives are to compare and contrast the range of roles that psychologists adopt in the oncology treatment team; the barriers and enablers associated with the introduction of psycho-oncology services in both the private and public health systems; and the ongoing supportive care needs of cancer patients. Particular attention will be given to the supportive care needs of male cancer patients and of those patients whose cancer has returned. The symposium will conclude with a discussion of the future directions of psycho-oncology research and practice in Victoria by Jane Fletcher, the current chair, Victorian Cooperative Oncology Group, Psycho-oncology Committee. Jane is a practicing psychologist and researcher who has worked with cancer patients for many years.

It’s like being a first class patient: A pilot study examining the experiences of patients participating in a cancer-related clinical trial

WOOTTEN, A. (Department of Urology, Royal Melbourne Hospital, Australia.)

To explore the experiences and identify the psycho-social support needs of patients enrolled in a cancer-related clinical drug treatment trial. This paper outlines a two-phased pilot study conducted at Royal Melbourne Hospital. 14 participants were recruited to phase two in which longitudinal data was collected across three time points; at the point of consenting to take part in the clinical trial, three months after commencing the clinical trial and six months after commencing the clinical trial. Participants experienced a mixture of hope, uncertainty and apprehension as they considered whether to take part in a clinical trial. At different stages of the trial they made sense of their participation by thinking about the possible benefits of participation. Trial participation was also associated with a number of emotional and practical challenges. The end of the trial was associated with a mix of emotions, including relief, disappointment, hope of future help, uncertainty and abandonment. Generally participants were very positive about the support they received from health professionals, family and friends. Clinical trial participation is, in general, a positive experience for many patients with cancer, although there are a number of associated practical and emotional challenges. Trial participants may benefit from closer follow-up from clinical trial staff, especially the treating doctor, assessment of support needs, and help in re-evaluating the meaning of their trial participation if their initial hopes and expectations are not met.

Keywords: psycho-social support, cancer, clinical trial, emotional factors, hope

Below the belt: Talking about life after prostate cancer. Results of a randomised controlled trial

SIDDONS, H. (Department of Urology, Royal Melbourne Hospital, Australia.)

The aim of this study was to evaluate the effectiveness of a psychological group therapy intervention entitled “Below the Belt: Talking about life after prostate cancer”. A total of 65 men, who were on average 24 months post-radical prostatectomy, took part in an 8-week group intervention. Participants were randomly assigned to either a waitlist group or intervention group. The intervention group completed questionnaires at 8 weeks pre-intervention, on the first day of the intervention and at the completion of the intervention. The waitlist group completed
questionnaires at 16 weeks pre-intervention, at 8-weeks pre-intervention, on the first day of the intervention, and at the completion of the intervention. A paired-sample t-test was conducted which indicated a number of significant changes across the time of the intervention as compared to the 8 week wait time. Sexual arousal significantly improved \( (t(56) = -2.49, p = .016) \); Sexual drive and relationship quality significantly improved \( (t(52) = -2.86, p = .006) \); Sexual Confidence significantly improved \( (t(57) = -9.12, p < .0001) \); Masculine self-esteem significantly improved \( (t(57) = 2.07, p < .05) \); The perception of Cancer Control significantly improved \( (t(57) = 2.54, p = .014) \) and the perception of making an informed decision worsened \( (t(55) = 2.05, p < .05) \). The mixed-between-within ANOVA used to compare the results of the intervention and wait-list groups over time revealed that sexual behaviour significantly improved over the period of the intervention as compared to the wait-list group. Wilks Lambda = .79, \( F(2, 29) = 3.95, p = .030 \) as did sexual intimacy, Wilks Lambda = .84, \( F(2, 43) = 4.03, p = .025 \). The results, as well as qualitative information gathered throughout the intervention, indicated that not only do men benefit from participating in a structured group therapy program across a number of QoL domains but that they also enjoy it. Men reported feeling more confident in their sexual lives, more self-confident in terms of their masculinity as well as well feeling supported by group members. This study lends strong support to the need for appropriate and timely psychological interventions for men coping with sexual dysfunction and highlights the importance of psychological care in the cancer setting.

Keywords: psychological group therapy intervention, effectiveness, prostate cancer, sexual behaviour, sexual dysfunction

Screening for distress in the private sector: Establishing a screening protocol and referral pathway for Cabrini Health

FLETCHER, J. (Cabrini Monash Psycho-Oncology Research Unit, Cabrini Health)

The utility of screening for distress in oncology patients has been well documented. With the view of establishing screening for distress as part of routine clinical practice at Cabrini Health, the Cabrini Monash Psycho-Oncology Research Unit set to assess the feasibility and acceptability of screening for distress in chemotherapy patients. 123 patients receiving chemotherapy at Day Oncology (Brighton or Malvern) or Ward 2C completed a self report questionnaire between May and September 2009. The project utilised the National Comprehensive Cancer Networks Distress Thermometer (DT) and problem checklist, the Kessler Distress Scale (K10), questions relating to satisfaction with the distress measures and a series of medical and demographic items. Participants included those with a breast (29%), haematological (22%), bowel (20%), lung (12%) and gynaecological (10%) cancer diagnosis. Over a third of the sample (31%) had a previous cancer diagnosis. Based on the clinical cut off scores for distress, 38% were classified as distressed using the DT and 24% using the K10. Both the DT and K10 were seen as being ‘easy’ or ‘very easy’ to use by in excess of 80% of the sample. The DT detected a higher number of distressed patients than the K10 and identified 18 patients as distressed that the K10 failed to identify, while the K10 identified three patients as distressed that the DT did not. Results from the DT’s problem checklist identified a range of physical concerns (fatigue 71%, constipation 41%), psychological problems (worry 41%, sadness 30%) and practical concerns (getting around 28%) for chemotherapy patients at Cabrini Health. Given the level of distress identified in patients undergoing chemotherapy at Cabrini Health and the satisfaction with and utility of the DT and problem checklist, the establishment of routine screening for distress in chemotherapy patients is seen as not only feasibility but acceptable to both patients and nursing staff.

Keywords: distress, oncology, clinical practice, chemotherapy, screening

The relationship of HPV knowledge, health value and health self-efficacy with men’s intentions to receive the HPV vaccine

BURNEY, S. (Cabrini Monash Psycho-Oncology Research Unit, Cabrini Health)
The aim of the present study was to determine whether HPV knowledge, health beliefs and health self-efficacy could predict intention to receive the HPV vaccine in an Australian male sample. 121 males, aged 18 to 26 ($M = 22.3$, $SD = 2.06$) years and residing in Australia, completed an online survey assessing HPV-related knowledge, health beliefs and health self-efficacy. A multivariate linear regression analysis revealed that, as hypothesised, HPV knowledge and health self-efficacy were significant independent predictors of vaccine acceptance at the $p < .05$ level. Contrary to previous findings, health value did not significantly predict vaccination intentions. In addition, a moderating effect was found between HPV knowledge and health self-efficacy. This research was the first to examine HPV knowledge, health beliefs and health self-efficacy, and their relationship with HPV vaccination intentions, in a sample of Australian males. Previous research regarding HPV vaccination intentions has largely focused on females, and as a result the factors that influence males to undertake HPV vaccination were largely unknown. This study, despite its limitations, has offered some useful insights into some of the factors that are associated with HPV vaccine intentions in a sample of Australian men. It is hoped that the results of this research will contribute to evidence-based health promotion strategies leading to an increasing HPV vaccine uptake in this population. It is expected that in turn this will lead to “herd immunity” in the Australian population thus preventing future acquisition of HPV-related illness and mortality.

Keywords: health beliefs, self-efficacy, males, HPV knowledge, vaccination

Putting “people” back into job design

Chair(s): UNSWORTH, K. (University of Western Australia)
Discussant(s): PARKER, S. (University of Sheffield)

There has recently been a resurgence of research into job design. While the number of characteristics that have now been identified as important within a job has drastically increased, an understanding of the role of people is still lagging somewhat behind. In this symposium, leading job design researchers from the US, the UK, and Australia discuss these ideas. The first paper uses data from 311 employees and their supervisors to investigate how the relationship between the leader and a follower affects job design. Interestingly, the authors found that more positive relationships were associated with more positive job characteristics which then had knock-on effects to satisfaction, task performance and citizenship behaviours. The second paper takes a slightly different perspective on the role of people in job design. In this theoretical paper, the author identifies a new type of job design that uses customers to co-produce the job outcomes, for example passengers checking themselves in at the airport. The paper presents some highly intriguing ideas about the prevalence and the implications of this new type of co-production. The third paper focuses on an existing construct that explicitly focuses on the person in the job. As demonstrated by its citations, job crafting has captured the imagination of many in organizational psychology, yet little attention has been given to its mechanisms and nomological network. This paper defines job crafting as a form of self-regulation, and generates a number of interesting proposals on this basis. Finally, the fourth paper looks at how job design is used to help people, particularly in managing their stress levels. By using the results from a series of studies, the author concludes that while changes to objective job design results in small but predictable changes, the biggest changes may come from changing the person themselves – most notably for our
Abstracts of the 27th International Congress of Applied Psychology

537

Symposia

symposium, by changing the person’s perception of the job and its context. Overall, the symposium highlights new and different ways in which people play a role in job design. The symposium includes both empirical and theoretical papers and together, they represent a significant advance in our understanding of job design.

Work design and social relationships: Exploring the role of leader-member exchange

MORGESON, F. (Michigan State University)
